ROUND OAK
STANDARD OF AMERICA

Long & Durr,
Harmon, Illinois,
write us under date
June 28, 1901:

"The Round Oak Furnace which we put in the school building here after your plans, has given the best of satisfaction, doing more than guaranteed. It is very economical and easily operated. The Board of Directors are highly pleased with the furnace."

We are the originators of the Round Oak System of school house heating with furnace heat.

Where our plans are used we have never failed to give perfect satisfaction.

Should any business of this character offer in your territory at any time and you advise us we will give it prompt attention and guarantee results.

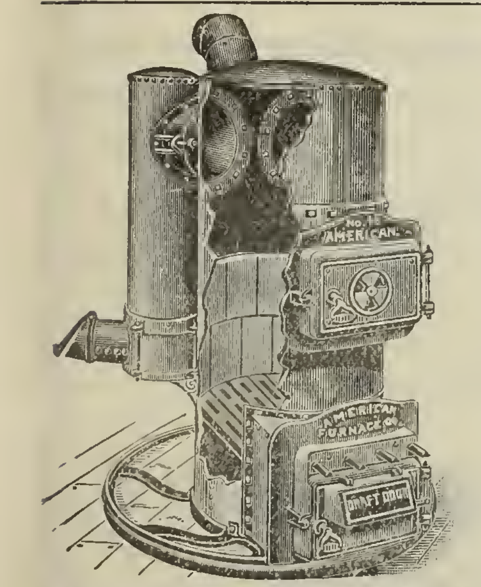
About Fire Pots.



Burn Hard or Soft Coal, or Coke. Large Doors.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak ; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

Hard Coal Feed.
Soft Coal Feed and Coking and Smoke Burning Magazine.

HAS

TALKING POINTS

OF MERIT

FOR THE DEALER.

SIMPLICITY.

In construction the Patric Furnace is exceedingly simple. This point always appeals to the prospective purchaser. No clogged radiator. It needs no clean-outs. Look at the illustration and see for yourself.

DURABILITY.

This is one of our hobbies. The Patric Furnace is noted for its durability. One man writes that his furnace has been in use every winter since 1873, twenty-nine years, and still heats as well as when it was first put in. Good materials account for that. We use them now and always have.

SMOKE-BURNING and COKING MAGAZINE.

Here's where we have a winner. It is a scientific feature that sells lots of Patric Furnaces. Used only on the Patric. A success for the past 17 years. Highly recommended by our customers. Cokes the coal and burns the volatile parts of the smoke and gases. A great talking point.

OUR HOT-BLAST.

Our hot blast device for aiding combustion delivers heated air directly into the combustion chamber. No part in the fire to clog or burn off. Your customers must have a hot-blast.

Send for catalogue, price-list and discounts to dealers.

UTICA HEATERS

Work Perfectly in Public Buildings.

This is only one letter—we have dozens more, all unsolicited, "up our sleeve."

BURGERT & BANISTER,

Builders' Hardware, Stoves, Tinware and House Furnishings.

Galion, Ohio, March 26, 1902.

UTICA HEATER CO., Utica, N. Y.

GENTLEMEN :

The "Utica Heater" which we put into the Public Library building here is proving a profitable piece of public spiritedness for us.

The Directors and Patrons of the Association are very generous in their applause of the heater, giving us all kinds of free advertising.

The President tells us that they heated the building one week with 30c. worth of coke, and in cold weather at that.

We have sold one big job on the strength of it, and have several others in view.

We are pretty well satisfied with the deal in general, and the "Utica Heater" in particular.

Yours truly,
BURGERT & BANISTER.

UTICA HEATER.

We manufacture hot air furnaces,—11 different styles, 48 different sizes,—for all possible requirements.

We also manufacture a very extensive line of steam and hot water boilers,—10 different styles, 128 different sizes.

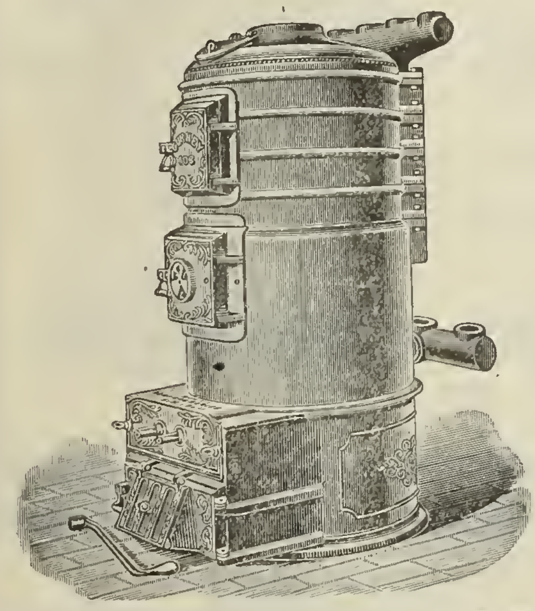
SCHILL'S New Idea Furnace

Is manufactured by a firm composed of practical furnacemen who have been in the business from their boyhood up. We have studied the wants of the people and to supply their wants has been our constant aim. The fact that our products have found their way into twenty-eight States, including almost every State in the Union where furnaces are used, and that in Crestline, O., the home of the Schill Furnaces, where, perhaps, more furnaces are used than in any single town of its size in America, not a single furnace of any other make has been sold for more than five years, demonstrates, beyond a doubt, the popularity of our furnaces at home as well as abroad, and we assure you no one is better prepared to serve you in this line than we are.

The Schill Bros. Co.,

CRESTLINE, O.

Never Over-Rated. . . . .



GURNEY HEATERS are never over-rated, neither in the estimation of the public nor in our claims for them. They will do exactly the work we say they will do. We declare that **GURNEY HEATERS** have no equal for efficiency, durability and economy. On account of the excellence of their construction they will maintain temperatures longer and require less fuel.

Do you not wish to handle the best? Write us for catalogues, etc.

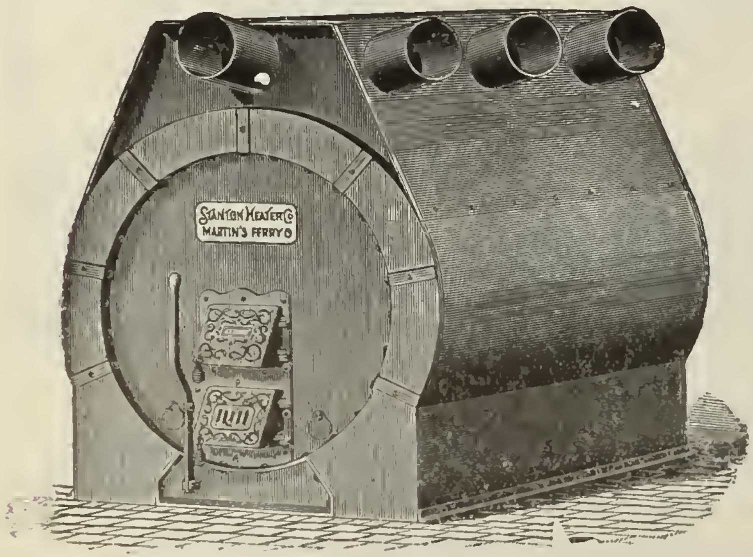
KEWANEE BOILER COMPANY
KEWANEE, ILLINOIS.

The Stanton Seamless Heater,

PORTABLE CASED.



STATE COLLEGE, PA., June 15, 1900.
THE STANTON HEATER CO , Martin's Ferry, Ohio.

GENTLEMEN :—The Stanton Heater is giving the best kind of satisfaction. It will produce good heat from any kind of fuel. My average cost of fuel, per month, for the past winter was three tons of coal dust from soft coal to heat 43,000 cubic feet of space with a No. 68 Heater ; however, this space is 3,000 cubic fect over the capacity of your Heater, but the heater did the work easy, and held the temperature in zero weather so it would not change over four degrees in twelve hours without touching the Heater.

The Stanton Heater is, in my judgment, the most modern and economical warm-air generator of this age.

Sincerely yours, J. N. KRUMRINE.

IF YOU ARE NOT SELLING THE
Peck-Williamson Underfeed Furnace
you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

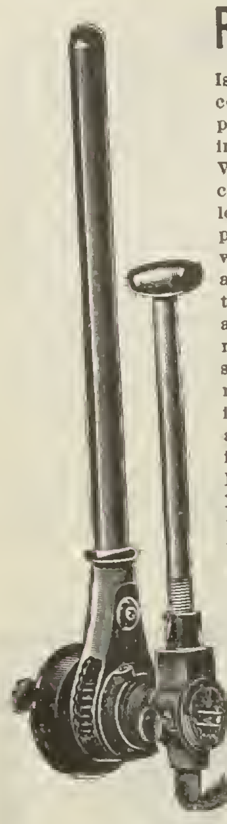
The Climax RATCHET STOCK



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2¼ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2¼, 3 and 4 in. die, $17.00

Kitchen Boiler Connections

A New and Enlarged Edition.

The attention of readers of The Metal Worker is directed to the *fifth and enlarged edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

A Selection of Practical Letters and Articles Relating to Water Backs and Range Boilers . . . . .

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

In Chapter	I.	Kitchen Boiler Below Range.
"	VI.	Water Hammer in Boiler Connections.
"	VIII.	Proper Connection for a Horizontal Boiler.
"	VIII.	Double Water Back Instead of Double Boiler.
"	VIII.	Two Horizontal Boilers Connected with One Water Back.
"	IX.	Supplying Hot Water in Large Buildings.
"	X.	Lime Deposit.
"	XII.	Hot Water Supply and Heating a Barn.

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

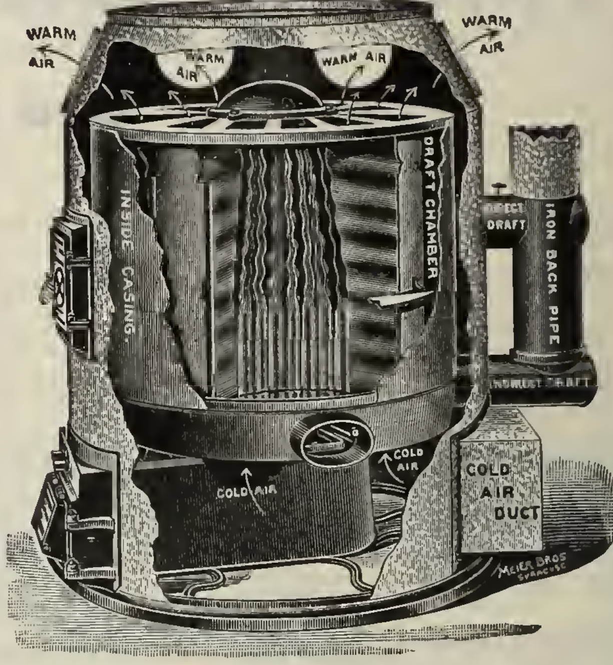
It tells How to Connect Kitchen Boilers and Water Backs Under All Conditions.
It explains Remedies to apply to all kinds of Difficult Cases.
Heating from Kitchen Boilers is fully described.

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

Price One Dollar, Postpaid.

David Williams Company, Publishers, 232-238 William St., N. Y.

The Kelsey Warm Air Generator.



Sectional View.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

A Large Spring Business.

The advent of spring finds the business interests of the United States enjoying a remarkable degree of prosperity. Not only is the volume of trade immense, but the activity is widely distributed and embraces practically all sections of the country. Reports from the various business centers are of a uniformly favorable character. Some cities report increases of as much as 25 per cent. over last year's spring trade, and payments at the principal clearing houses for the past few weeks have been considerably larger than a year ago. So great is the consumptive demand for all kinds of goods that in many instances dealers have been found unprepared for the rush of spring orders. This condition is partly attributable to the transportation delays of a few weeks back, and the trouble experienced by manufacturers in securing fuel and materials, owing to the shortage of cars. These difficulties, however, are rapidly being overcome and their effects will gradually disappear. Mills and factories generally are very busy and in many lines manufacturers are hard pushed to get out enough products to satisfy the pressing needs of their customers. Complaints of difficulty in securing prompt shipment of goods are made in various quarters, and no little inconvenience seems to be felt in some trades by reason of inability to obtain materials that are urgently needed. The unusually large volume of building now in hand in all parts of the country is calling for a vast amount of material, and there are threatenings of shortage in some lines. The iron and steel industry, which is usually regarded in the light of a business barometer, displays greater activity than at any previous time in the history of the trade, with prices moving on a reasonably remunerative level. A disposition is apparent on the part of many consumers to place contracts for far distant deliveries, indicating the fear of higher prices in the future. So far, however, no upward movement of any moment has taken place in the price of iron and steel products, and it appears to be the determined policy of the leading producers to maintain a steady market and discourage any " boom " in values. Labor controversies furnish about the only untoward factor in the business situation at the present time. Strikes and disputes have cropped up in several directions; but these troubles have lost some of their disturbing influence since the Conciliation Committee of the Civic Federation has achieved such a marked success in bringing employers and employed together and securing amicable settlements of matters in dispute. It is hoped that most of the existing labor controversies will be satisfactorily settled before they reach a serious stage. The industrial outlook presents nothing to warrant the apprehension of danger to the business interests of the country.

Natural Gas in Indiana.

The announcement that the natural gas companies of Indianapolis, and Muncie, Ind., have served notice that they will not supply natural gas for fuel purposes after October next is a further indication of the failure of the supply in the Indiana natural gas belt. For some time past the reports of the State Gas Inspector and those of the Government experts have foreshadowed the exhaustion of the supply of this fuel, and the fact that many of the larger Indiana factories, including the big mills of the American Tin Plate Company and the American Sheet Steel Company, which had been utilizing fuel gas, have abandoned its use in favor of coal shows that the day of cheap fuel in that region is rapidly passing without any prospect of a replenishment of the supply. It is said that whereas every foot of territory in the Indiana gas belt has been drawn upon, the pressure is diminishing rapidly, indicating that the supply is giving out, with the prospect of eventually ceasing altogether. This is a serious condition of things for some of the smaller industries which were established in that region entirely on the strength of the cheap fuel. Some of these enterprises have already been abandoned and others, including several glass works, will shortly remove from the district. The communities in the Indiana gas region which have been using natural gas for domestic purposes will also feel the loss of this cheap illuminating and heating agent. It is said that by next winter nearly all the users of fuel gas in the State will be forced to revert to coal, or other fuel, which will mean to them a considerable increase in expense. The failure of the natural gas supply, too, will naturally arrest to a considerable extent the industrial development of that part of the country.

Impediments to Learning Trades.

One of the institutions that is held in the highest esteem by the citizens of this country is the public educational system, which not only provides schools that the poorest may attend, but, in many instances, compels attendance at the schools and provides for a truant officer to enforce this law. No doubt this is considered by some a rather drastic measure, but it is doubtful if there is any number of well informed persons who fail to see the benefit that the country is deriving from the system. Notwithstanding this national provision for the general education of the young, a disposition is manifest on the part of many citizens who are working at trades to interpose hindrances to those ambitious youths who desire to learn some trade. The master plumbers of Lynn, Mass., recently have been invited by the journeymen to enter into an agreement which, among other provisions, would extend the term of apprenticeship to six years, and would require that those who enter the trade shall be seventeen years of age. At the present time the term of apprenticeship is but three years. Another clause of the proposed agreement is that only one apprentice shall be allowed in a shop. No objection has been raised to the time and wage clauses of the agreement, but the age of entry and term of apprenticeship and the limitation of the number of apprentices are questions of moment as to which there is a sharp difference of opinion. Already so many obstacles have been placed in the way of young men desirous of learning trades that public spirited citizens have established trade schools where, under the conditions now prevailing, the rudiments of a trade can be better learned than in the shop. The fact that many young men at the end of their apprenticeship are not competent workmen is due not so much to the shortness of the term as to the fact that under the conditions in which business is done to-day neither the employer nor his workmen spend the time in instructing the apprentices to which their service justly entitles them. Again, the higher educational training of the graduates of the public schools enables a bright, healthy boy to learn a trade in a shorter time than was possible when the old apprenticeship system was in vogue. Any attempt to hinder a young man from learning a trade and thereby preventing his becoming a useful citizen is not only a great injustice to the would-be apprentice, but also to the community to which he belongs and to the country at large. Those who are identified with such an effort doubtless feel the necessity of preventing their branch of trade from being overcrowded with workmen, with the atendant danger of a reduction of the rate of wages. The grounds for these fears, however, are hard to discover by those who are familiar with the history of the different trades, which shows that a larger number of workmen are employed and at better wages than ever before. The policy of limitation is reactionary and inconsistent with the spirit of modern progress.

The Skyscrapers of New York.

One of the most marked features of the development of modern New York is the extraordinary number of large, many-storied structures that have been springing up in the city in the past few years, taking the place of old and much smaller buildings. So many and so lofty are the skyscrapers of downtown New York that the aspect of the lower part of the city has undergone a complete change in the past ten years. Until within two or three years these tall buildings were almost wholly confined to the lower business section of Manhattan Island, but they are gradually creeping further and further uptown, until now many skyscraping apartment houses stand sharply out on the sky line even above Central Park. The past year witnessed a remarkable development in this class of building. Fully a score of great office and business buildings were erected or begun below Fourteenth street, representing an invested capital of about $40,000,000. A remarkable thing about these business skyscrapers is that, although they provide accommodation for many times the number of tenants that were housed in the buildings they have displaced, they quickly fill up. No sooner is one of the big new office structures completed than its myriad rooms are occupied. Yet the older office buildings do not seem to be deserted. The explanation, no doubt, lies in the fact that New York City is year by year becoming more completely recognized as the commercial and financial center of the country. Commercial and industrial institutions and companies in all parts of the country are establishing agencies or branch offices in the metropolis. Most of the great consolidations formed within the last few years have also established their headquarters in the city, and some of them are occupying whole floors in the modern skyscrapers. With these have come a crowd of smaller concerns who find it desirable to be at the center of the business nerve system of the country. As a matter of fact, real estate agents say that the demand for office accommodations in downtown New York at the present time is greater than the supply, notwithstanding the enormous increase that has been provided of late years in the new skyscrapers. There is claimed to be a long waiting list of applicants for offices in all of the best office buildings. These buildings are evidently favorably regarded as investments, and it is said that notwithstanding the vast sums of money that are put into their construction, furnishing and equipment, most of the big modern business structures of New York are yielding large and steady profits to their proprietors.

The manufacturers of the country are now importing more than a million dollars' worth of materials for their workshops every day in the year, and are exporting more than a million dollars' worth of their finished product each day. The imports of manufacturers' materials in the eight months ending with February 28, 1902, according to a statement just issued by the Treasury Bureau of Statistics, were $270,202,774 in value, and the exports of finished manufactures during the same period were $257,907,430. Thus, in 243 days of the fiscal year, the manufacturers have imported $270,000,000 worth of material and exported $257,000,000 worth of their finished product, thus averaging more than $1,000,000 of imports and exports combined for every day of the fiscal year up to the beginning of last month. The importation of manufacturers' materials was far greater in the first eight months of the current fiscal year than in the corresponding period of any preceding year, while the exports of manufactured goods was only exceeded in the two eight monthly periods immediately preceding, and that but slightly.

A conference looking to more harmonious relations between employers and workmen took place in England lately, the parties being the Employers' Federation and three of the leading unions, but the stipulations proposed by the Employers' Federation were promptly rejected by the workmen. The proposition made to them was that the employers should not be interfered with in the management of their business in any way; removal of all restrictions as to output and piece work, and no objections made as to the number of apprentices or the employment of nonunion men. The employers, for their part, agreed not to black list any because they belonged to unions, or to institute piece work prices which would be less than the recognized trade union rates. These conditions seem easily complied with by both sides, but the men rejected them by a vote of two to one.

Senator Hanna, chairman of the Conciliation Committee of the National Civic Federation, has appointed the following as members of the committee: Marcus A. Hanna, Samuel Gompers, Oscar S. Straus, Charles A. Moore, R. M. Easley, Archbishop Ireland, Bishop Potter, Franklin MacVeagh, John Mitchell, Frank P. Sargent, James Duncan, J. Kruttschnitt, Marcus M. Marks, William H. Pfahler. By a resolution passed at a former meeting of the Federation, this committee is vested with power to proceed to settle labor disputes and bring about various proposed industrial reforms.

The Compulsory Industrial Arbitration Court, whose membership includes representatives of employers and employees, which was recently established in Australia, will open this month. Its operation will be watched with interest.

ADVANCE IN MOLDERS' WAGES.

Another advance in the price of stoves is to be expected as a result of the new agreement made at Chicago last week between representatives of the Stove Founders' National Defense Association and a committee of the Iron Molders' Union of North America. The conference was held at the Auditorium Hotel on March 28 and 29. The molders' committee asked for an advance of 10 per cent., as had been expected, but after the matter had been thoroughly discussed and the conditions of the trade were fully set forth by the manufacturers an agreement was reached which provides for an advance of 5 per cent., which went into effect on the 1st inst. and will continue in force for one year from that date.

The demand for an advance of 10 per cent. was based not only on the general prosperity now existing throughout the country, but also on the ground that the cost of living had considerably increased during the year, and workmen should, therefore, receive greater compensation. In behalf of the manufacturers the facts were pointed out that since 1898 the wages of molders had been advanced twice, one advance being 10 per cent. and another 5 per cent. The increase in wages, however, has been greater than indicated by these figures. During the past four or five years adjustments in board prices on new goods have been made in various districts of the country, and the piece prices received by molders have been almost invariably advanced. On this basis the wages received by molders the past year have represented from 20 to 25 per cent. more than the wages ruling in 1898. The additional advance of 5 per cent. just granted will bring molders' wages up to about 30 per cent. above the basis of 1898. It was further pointed out that as stove molders' wages had not been reduced during the depression existing from 1893 to 1898, the advances made since then have been based on a higher level of wages than in other trades in which reductions were made during that depression. These arguments were convincing to the molders' committee and were effective in causing them to modify their demand.

The agreement which has been made assures to the stove trade a continuance of peaceful relations with molders during the coming year. While all the stove manufacturers are not members of the Stove Founders' National Defense Association, the wages which are established by this association are accepted in all the other stove foundries, so that the new rate may be said to be effective throughout the country. It is not expected that the manufacturers will pay the higher rate of wages without endeavoring to reimburse themselves by asking a higher price for their stoves, especially as the cost of materials is steadily advancing.

THE ANNUAL CONVENTIONS OF STOVE MANUFACTURERS.

Secretary Thomas J. Hogan of the Stove Founders' National Defense Association and of the National Association of Stove Manufacturers is busily engaged at the headquarters in Chicago preparing and getting out circulars calling for the annual conventions of these bodies, to be held in New York City next month. The seventeenth annual meeting of the Stove Founders' National Defense Association will be held at the Waldorf-Astoria on Tuesday, May 13. The thirty-first annual meeting of the National Association of Stove Manufacturers will take place at same hotel on Wednesday and Thursday, May 14 and 15. This is in accordance with the constitution, which provides that the annual meeting shall be held on the second Wednesday in May, which makes the meeting quite late this year. There are many things that will make this year's meeting of special interest. As the hospitality dispensed in New York has always been appreciated, this fact, taken in connection with the natural attractions of a visit to the Empire City, is expected to draw a large attendance to the conventions.

Combined Hot Blast and Smoke Consumer.

John D. Ehrlich, proprietor of the Indianapolis Artistic Pattern Works of Indianapolis, Ind., has recently secured letters patent on a combined hot blast and smoke consumer for ranges and cook stoves, embodying a number of interesting features. The results obtained by Mr. Ehrlich consist in procuring air through ingress bowls, which are secured to and located near the rear of the top of the range or stove, conveying the air through a specially constructed pipe to the fire pot and thence discharging it through semicircular slots over the point of combustion. The object is to heat the air before it is discharged, thus effecting a more perfect ignition and combustion of the gases which arise from the fire. We understand that the device can be added to any stove or range, and that a greater number of units of heat are procured from the same amount of fuel consumed under present methods, while the relative ratio of radiation is correspondingly increased. Another point to which Mr. Ehrlich calls special attention, and one which is likely to be highly appreciated by the public, is that the use of the device eliminates the necessity of building a fire every morning, as the stove or range equipped with the hot blast will readily maintain a fire over night.

The Excelsior Elbows.

The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, have issued an illustrated circular describing a few of the various kinds of elbows which they manufacture. The illustrations given comprise the Excelsior Parlor elbow, adjustable elbow, long end elbow, extra long end elbow and short end elbow. These elbows are made in all sizes and materials, both adjustable and stationary. The joints of the adjustable elbows are oiled during the process of manufacture, thus insuring ready adjustment at all times, but the oiling does not prevent the elbows from being easily blackened. They are made by special machinery, all being perfect and having no projecting seams to mash down in shipping. These adjustable elbows are made up to 48 inches in diameter, and with 2-inch and 4-inch slips. The Excelsior Parlor elbows are finely constructed and finished, are oiled automatically, enabling them to be carried in stock any length of time without injury, and are made with rivets in the throat or with rivets in the back, so that a finished appearance is always presented. In shipping, one-half are furnished with rivets in the throat and one-half with rivets in the back. The stationary elbows are made with 1¼ and 2 inch slips.

"Just a Cook Book."

Under the above title, George M. Clark & Co., Chicago, have issued a handsomely printed and very attractive and valuable publication of some 50 pages, bound in a paper cover, bearing an appropriate illustration in colors. This little volume contains a large number of tried recipes for making all sorts of dishes and dainties. It does not aim to be a complete manual of cooking, but, as stated in the preface, "the recipes are all practical ones for people who live well and like to have appetizing dishes on their tables. They were collected originally for publication in a cook book issued by the women of a church in an attractive suburb, and are the recipes of good housekeepers, people who owned their own homes, had a welcome always for friends and worthy strangers and sometimes 'entertained angels unawares.'" The book contains illustrations of Jewel gas ranges, which are so inserted that they do not obtrude themselves as advertising matter. The book will undoubtedly be highly appreciated by all who may be so fortunate as to secure a copy. The contents were compiled by Henry M. Hubbard, secretary of the company, whose literary attainments have enabled him to make the book of more than ordinary interest.

The Kansas City Furnace Company of Kansas City, Mo., have been incorporated with a capital of $15,000, by Edward L. Salmon, Benjamin F. Thompson, William T. Jamison and others.

Modern Furnace Heating.

A Combination Hot Air and Hot Water Heating and Ventilating System.

It has been noticeable in the past two or three years that the furnace system of heating has been used for warming a far greater portion than its natural share of the fine residences which have been erected throughout the country. This has been reflected not only in the inquiry on the part of architects and their clients, but also in the increased sales of the best grades of furnaces by furnace manufacturers generally. The furnace system of heating has long been established in the favor of those who appreciate the value of continual change of air and notwithstanding the difficulties which in some instances attend the heating of distant rooms. It is recognized that furnaces work better wherever some means is provided to exhaust the air in the building and allow for the unhindered inflow of a volume of fresh warm air.

After considering the different methods of heating used in fine residences, A. O. Sherman selected a combination furnace and ventilating system for East Cliff, his residence at Rye, N. Y., erected from plans designed by his architect, F. A. Rooke, 489 Fifth avenue, New York. East Cliff stands on a bluff on the shore of Long Island Sound, exposed on all sides, as shown in Fig. 1, requiring in winter weather apparatus of ample capacity for providing a comfortable temperature.

THE APPARATUS.

The apparatus selected for the heating was two No. 260 Thatcher tubular hot air and hot water heaters, made by the Thatcher Furnace Company of 240 Water street, New York City. They were installed in accordance with plans made by William Miller, one of their furnace heating engineers. A feature of the system is the use of the Miller patented system of exhaust ventilation in connection with the furnaces. The work was done by George Siltz of Port Chester, N. Y. The plan of the first floor of the house is presented in Fig. 2, and the work of the heaters is increased from the fact that the second floor, shown in Fig. 3, extends over the large porch running along the entire southeast side of the house. In addition to heating these two floors the servants' rooms on the third floor are warmed from a register placed in the rear hall, as shown in Fig. 4, which is a plan of the third floor. A bathroom on this floor is heated from the same pipe which heats the store room below, and a pipe also leads to a large room that is used for a play room. The location of the combination heaters is shown in Fig. 5, which is a plan of the basement.

Fig. 2.—Plan of First Floor.

This plan also shows the location and run of the cold air supply pipes which lead from the northwest side of the building. The furnaces are supplied independently of each other, galvanized iron ducts leading from the windows down through mason work trenches running under the cellar floor to the pits under the furnaces. In the vertical portion of the ducts dampers are placed for controlling the fresh air supply, and so arranged that the supply from out of doors can be shut off and the air supply taken from the basement in case of high winds. The openings are sufficiently large to allow the ducts to be entered for cleaning, the ducts being 16 x 36 inches in size.

Modern Furnace Heating.—A Combination Hot Air and Hot Water Heating and Ventilating System.—Fig. 1.—View of East Cliff.

TWIN FURNACE CONNECTION.

The furnaces are set in a battery with twin connection, a feature of which is the construction of the top. From the rim, which fits on the oval casing ring, the top pitches both ways, as shown in Fig. 6. Instead of the casings of the furnaces, which are 60 inches in diameter, continuing to the top all around, they are cut down on the sides for a distance of about 2 feet. This is done for the purpose of allowing the air from one furnace to readily flow over and fill the pipes over the other furnace, when the second furnace has no fire in it. The pitch of the top is also given such an angle as is best calculated to deflect a portion of the air rising through the furnace, so as to insure a distribution of the hot air through all of the furnace pipes.

The run of the furnace pipes is clearly shown in the basement plan, and by reference to the other plans it will be noted that while a number of the pipes lead to registers on the second floor, round pipes are used in all instances except where a 4 x 11 inch flue leads to a small room directly over the warm apartments below. It will also be noted that in several instances, after the hot air pipe reaches the floor, it runs over under the floor to a register located in accordance with the requirements of the furniture, and it is pointed out as of special interest that warm air flows freely from the registers connected with these pipes.

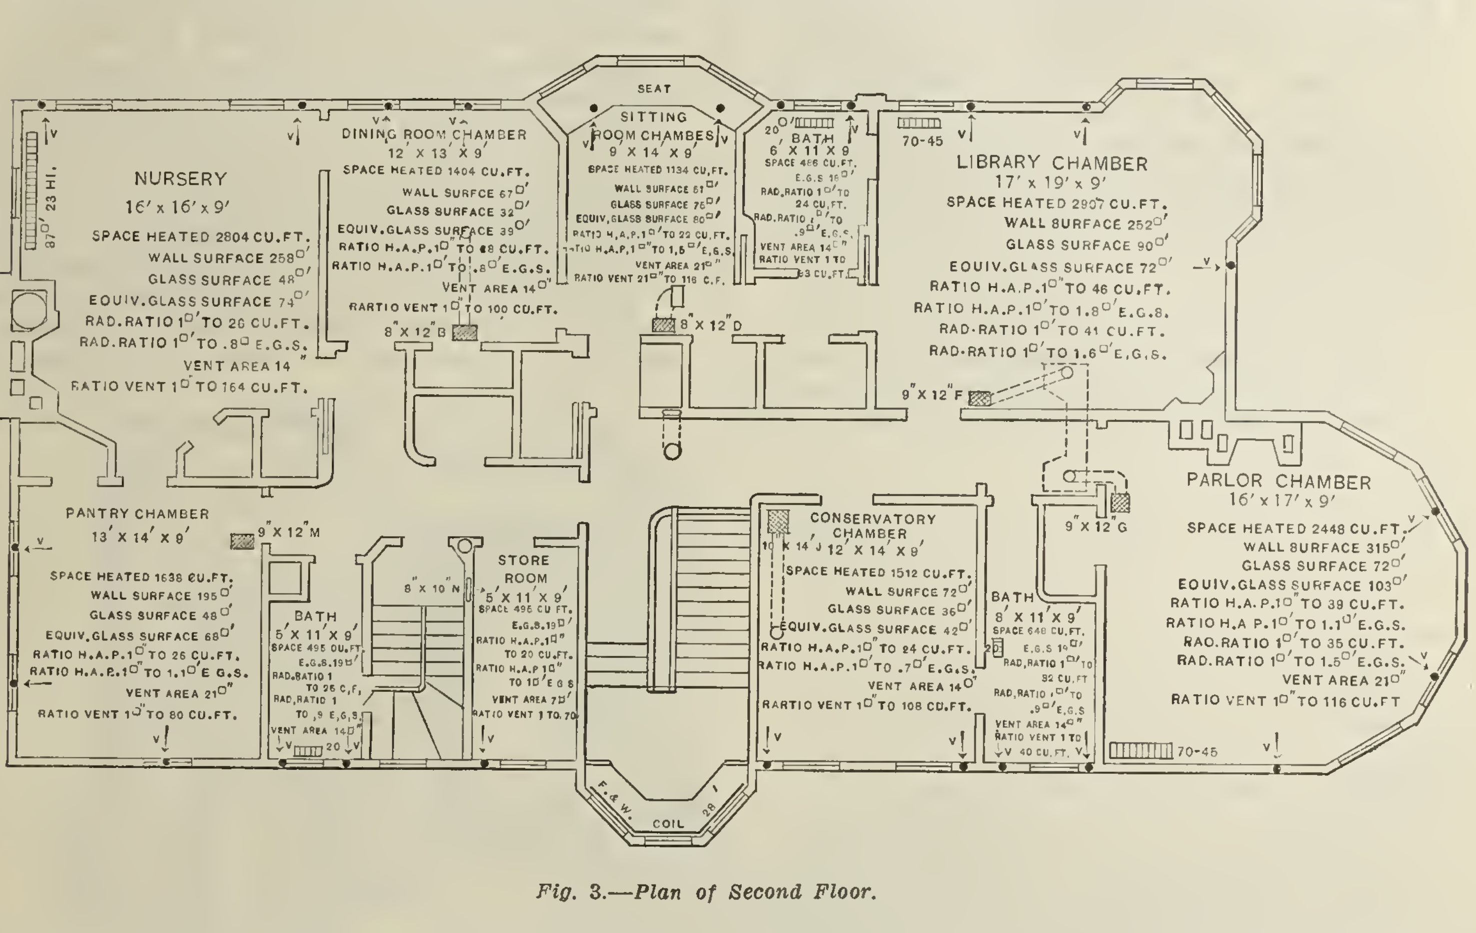

Fig. 3.—Plan of Second Floor.

THE VENTILATING SYSTEM.

The free flow of air noticed at the registers is due to no small extent to another interesting feature of this heating plant, which is the Miller patent exhaust ventilating system. On the first and second floor plans arrows marked V indicate the location of exhaust ventilating registers. There are small face plates placed in the base boards connected with 3-inch pipes. The location of the vent pipes, as indicated on the outer walls, is for the purpose of carrying away the foul air and the cooler air, which falls along the cold walls and which would otherwise have the effect of chilling the atmosphere in the rooms. The 3-inch pipes run from the first and second floors to the main exhaust pipes in the basement, which run to the furnaces and connect with the exhaust drum which envelops the smoke pipe, the full strength of the draft of the chimney acting as an exhaust on these vent ducts by means of the Miller exhaust ventilating devices. The operation may be readily understood from the illustrations given in Fig. 7. Dampers are so arranged that when a strong fire is needed the air returning through the vent connections passes through the ash pit and up through the fire to supply the draft. When it is desired to check the fire the damper to the ash pit supply is closed and the check damper on the smoke pipe

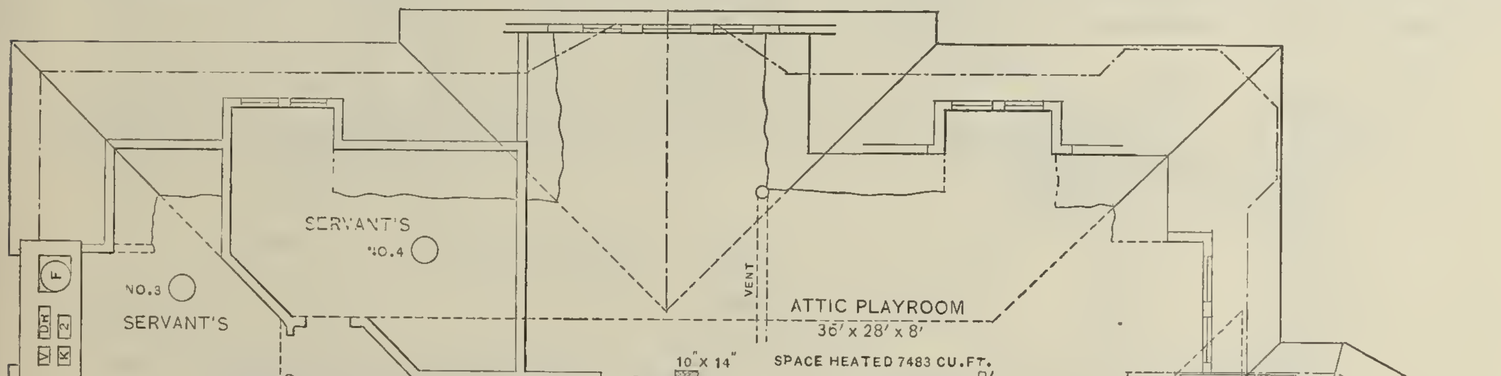

Fig. 4.—Plan of Third Floor.

is opened, so that the air drawn from the rooms through the exhaust system enters the smoke pipe direct and passes to the chimney.

The furnaces each have a 9-inch smoke connection leading into a 20-inch drum, from which a 16-inch pipe leads over to a 24-inch tiled flue. This smoke and vent pipe from each of the furnaces runs independently to the flue, where a Y is used to connect them with the flue in such a way as to reduce the friction in making the connection, and the upward turn is so made that the full strength of the draft of the warm 24-inch flue is utilized, not only for carrying off the smoke and exhausting the foul air from the building to improve the atmosphere, but also to facilitate the inflow of warm air from the furnaces to the different rooms to facilitate the heating.

THE HOT WATER SYSTEM.

Another feature of the heating plant is the hot water section. Each of the furnaces is supplied with a hot water heater exposing about 18 square feet of surface to the fire. The water heater consists of an annular ring which forms the upper part of the fire pot, so that the heat of the burning fuel comes in contact with this portion. Openings are arranged in it for the return pipe from the water heating system. Openings are also provided at four places for 2-inch pipes to lead from this ring to the water heating dome and suspended in the upper part of the combustion chamber. This water heater is so designed and arranged as to offer as little interference as possible in attending the fire and also to detract as little as possible from the air heating efficiency of the furnace. A flow pipe 3-inches in diameter leads up through the top of the furnaces from each of these water heaters to a 3½-inch pipe, from which a 2 and a 3 inch branch runs to supply the risers to the different radiators, as shown on the basement plan. These radiators are placed in the most distant and exposed rooms, and in some instances both radiators and hot air registers are provided for heating them.

A coil of 1¼-inch pipe is used for heating the conservatory, and in the bow window at the landing to the upper floor hall Fowler & Wolfe wall radiators are used to secure a more ornamental effect. An expansion tank, arranged to circulate and provided with an overflow, is located in the bathroom on the third floor.

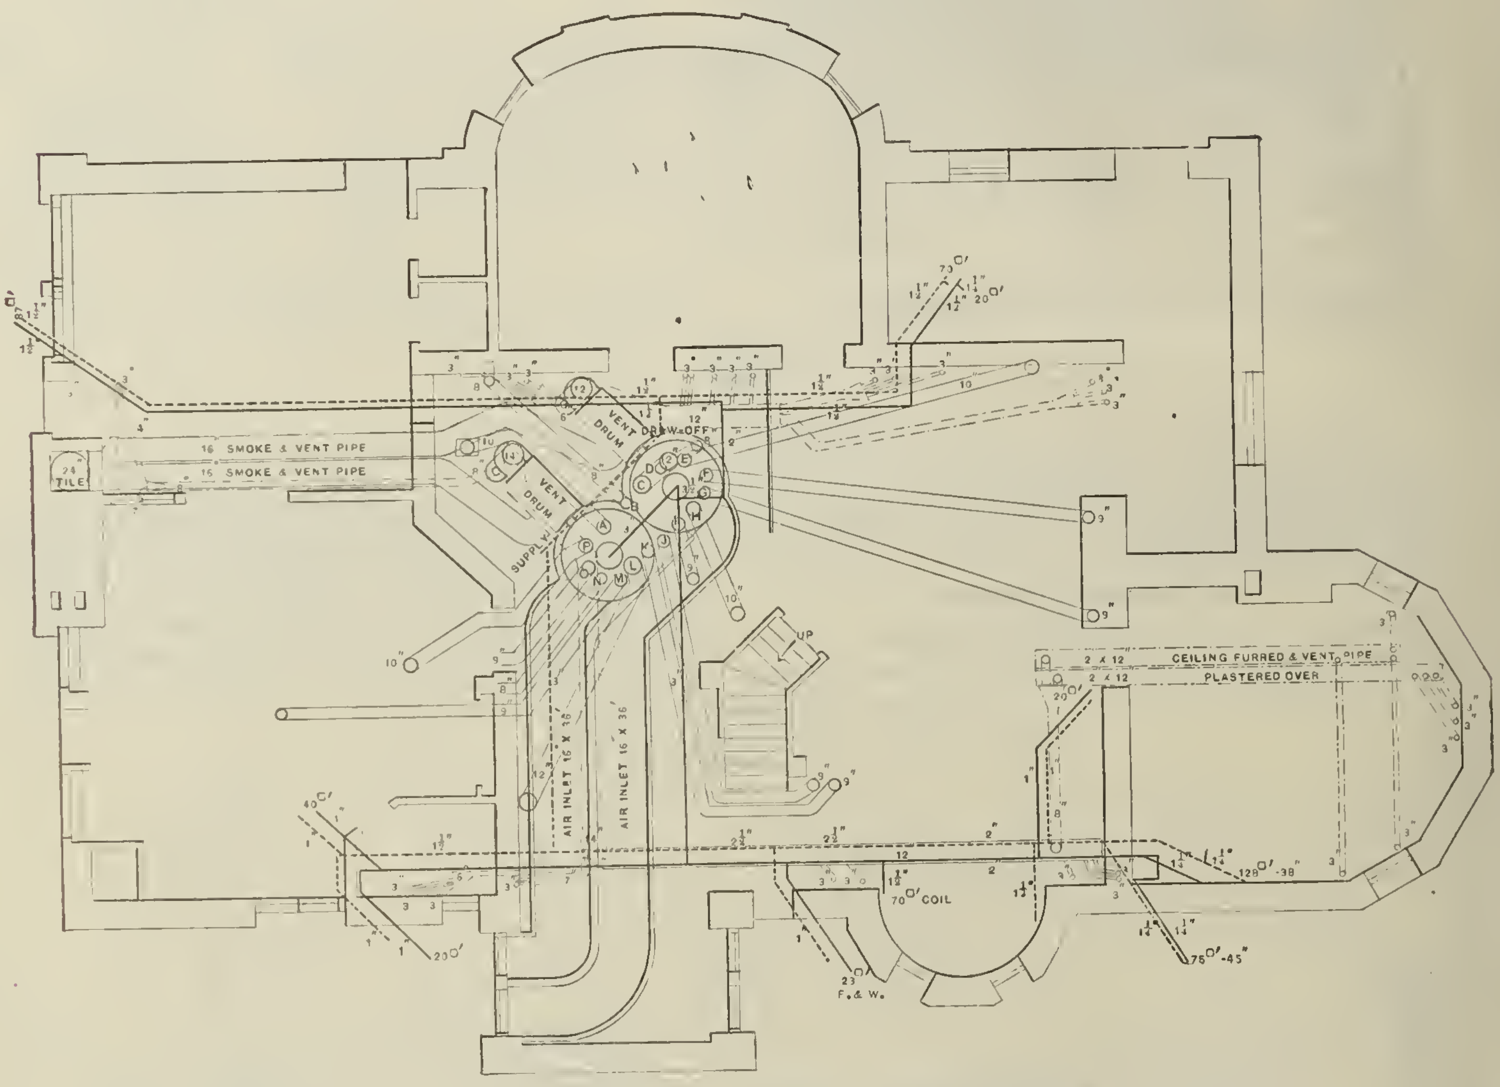

Fig. 5.—Plan of Basement, Showing Hot Air and Hot Water Piping and Ventilating Pipes.

THE DATA ON THE PLANS.

For the convenience of those who wish to study the proportions between the different parts of the system the floor plans give the dimensions of the different rooms, the space heated, the wall surface, glass surface, equivalent glass surface and the ratio between 1 square inch of area in the hot air pipe and 1 square foot of surface in the radiator to the space heated, and to the equivalent glass surface. They also give the area of the vent pipes leading from the different rooms. This will enable a more correct idea to be formed of the relation that the various parts of the system bear to each other.

In calculating the equivalent glass surface it is assumed that an expanse of 10 square feet of wall surface has the same cooling effect as 1 square foot of glass surface.*

It will be noticed that generous provision has been made for heating, as will always be the case in first-class work. Many will be of the opinion that the apparatus is larger than is needed for the work, but owing to the exposure it is commendable judgment that has been used in taking absolutely no risk in providing apparatus to maintain a comfortable temperature under all conditions of weather and outside temperature.

It is also interesting in the study of this plant to know that it has been thoroughly tested during the coldest weather of the winters of 1901 and 1902 operating perfectly in every detail and demonstrating that in the milder weather of spring and fall it is not necessary to fire both furnaces. A test of the plant with fire in operation in only one furnace has shown a circulation of hot water in all of the radiators and a flow of hot air from all of the registers, and an outflow of all cold air from every ventilating register in every room in the house.

---

* For the sake of convenience only, when this article was prepared, 10 square feet of wall surface was calculated as equivalent in cooling effect to 1 square foot of glass, while 4 square feet of wall surface is the equivalent generally considered in the heating trades. This explanation is made to prevent errors and misunderstandings.

THE RELATIVE PROPORTIONS OF THE SYSTEM.

For a further study of this plant the following figures have been prepared. The furnaces have a 60-inch casing lined with asbestos and provided with a corrugated shield of bright tin. The construction is such that the space through which the air must flow in being heated at the most restricted point provides an area of 1237 square inches, while the combined areas of the 16 hot air pipes leading from the furnace aggregates 1129 square inches. The cold air supply ducts have an area of 576 inches, or a total of 1152 square inches.

The construction of the furnaces provides for a large expanse of heating surface and for the indirect passage of the gases through the furnace before they find their final outlet in the smoke pipe. The heating surface in each furnace amounts to 100 square feet. The fire pot is provided with extended surface in the form of pins ¾ inch in diameter and 2½ inches long, sufficient in number to expose a surface of more than 4 square feet. There are 15 tubes 4½ x 16 inches leading through the combustion chamber at a point where the direct radiation from the hot fire is upon them and the gases in passing to the annular radiator must circulate around them. These tubes present a surface of more than 23 square feet, while that exposed by the combustion chamber dome and the top return flue radiator make a total of 100 square feet of surface in each furnace. The grate in each furnace is 29 inches in diameter, having an area of 660 square inches, or 4.6 square feet.

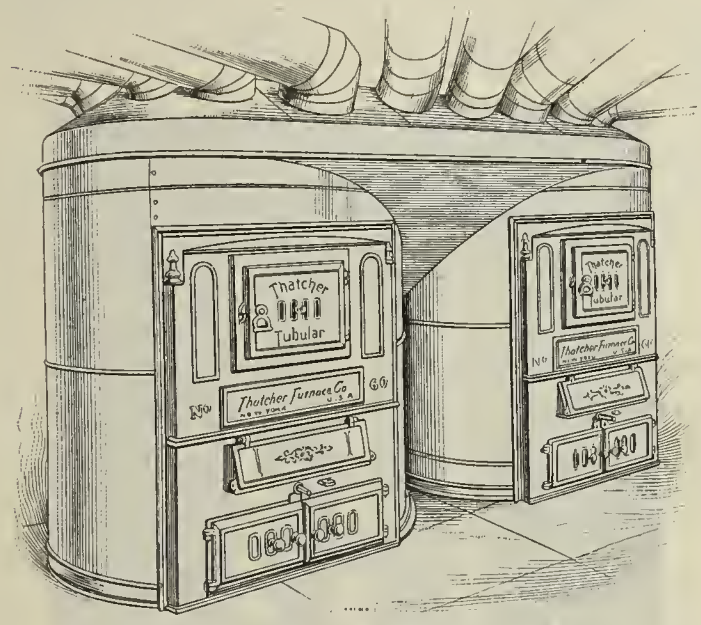

Fig. 6.—The Twin Furnace Connection.

THE AMOUNT OF HEATING DONE.

The space heated in the building, including the servants' rooms on the third floor heated from the hall, amounts to 45,349 cubic feet, having a wall surface of 3462 square feet, a glass surface of 1176 square feet, and an equivalent glass surface of 1702 square feet. When both furnaces are running the grate area bears a proportion to the work done of 1 square foot of surface to 10.8 square feet of heating surface in the furnace, and 5038 cubic feet of space heated, and to 185 square feet of equivalent glass surface. In square inches the grate bears a proportion of 1 to 34.3 cubic feet of space heated and to 1.3 square feet of equivalent glass surface. When only one furnace is in use the grate bears a proportion of 1 square foot to 10,076 cubic feet of space heated and 370 square feet of equivalent glass surface, and in square inches a proportion of 1 square inch to 64.6 cubic feet of space heated and to 2.6 square feet of equivalent glass surface. Each of the furnaces presents in the fire pot, tubes and radiators 100 square feet of surface and the grate bears a relation to this surface of 1 square foot to 10.8 square feet.

THE HOT WATER SYSTEM PROPORTIONS.

The furnaces are both provided with a water heater exposing about 18 square feet of surface and showing a proportion of 1 square foot of grate surface to about 4 square feet of heating surface. For heating the building there are 10 radiators, having a total surface of 553 feet. When both furnaces are running the grate surface will bear a proportion of 1 square foot to 60 square feet of radiating surface. With both furnaces 36 square feet of surface in the two water heaters bear a relation of 1 square foot to 15 square feet of radiating surface. When but one heater is used the proportion is 1 to 30. When one furnace is used the surface in the water heater bears a proportion of 1 square foot to 614 cubic feet of space and to 32 square feet of equivalent glass surface. When both furnaces are used the proportion is 1 square foot to 307 cubic feet of space and to 64 square feet of equivalent glass surface.

In order to show the proportions existing in the work done by both the air heating and water heating sections of the system it is estimated that each square foot of surface in the radiators heats 20 cubic feet of space, making a total of 11,060 cubic feet of space, and on the same basis of calculation the water heating section takes care of 574 square feet of equivalent glass surface, or a proportion of 1 square foot of radiating surface to a little more than 1 square foot of equivalent glass surface.

THE HOT AIR SYSTEM PROPORTIONS.

When both furnaces are used the heating surface exposed for heating air amounts to 200 square feet, and bears a proportion to the space heated with hot air, which is 34,289 cubic feet, of 1 square foot to 171 cubic feet of space and to 5.6 square feet of equivalent glass surface.

When but one furnace is in use the heating surface bears a proportion of 1 square foot to 342 cubic feet of space heated and to 11.2 square feet of equivalent glass surface. The combined area of the 16 hot air pipes of the various sizes shown on the plans is 1129 square inches, slightly less than the combined area of the two cold air supply ducts, which are 16 x 36 inches in size, having an area of 576 inches each and a total area of 1152 square inches. The hot air pipes leading from the furnaces are all marked with a letter, and at the registers in the different rooms is a letter showing which hot air pipe on the furnace supplies the register in that room. The relation of the hot air pipe area to the 34,289 cubic feet in that portion of the building which is heated with hot air is 1 square inch to 30 cubic feet of space and to 1 square foot of equivalent glass surface.

THE VENTILATION SYSTEM PROPORTIONS.

There are 35 3-inch vent pipes leading from the different rooms in the building. Each pipe has an area of 7.07 square inches, making a total of 247 square inches of area in the small exhaust ducts, which bears a relation of 1 square inch to 183 cubic feet of space. It will be noticed that the area of the exhaust ducts invariably increases over that needed to equal the small ducts connected with them, and in consequence a much stronger exhaust is effected through the 3-inch pipes than would otherwise be gained. Wherever it has been possible the exhaust ducts are round in shape, but in two instances it has been necessary to run the exhaust ducts for a portion of their length between the joists, where a rectangular pipe has been used.

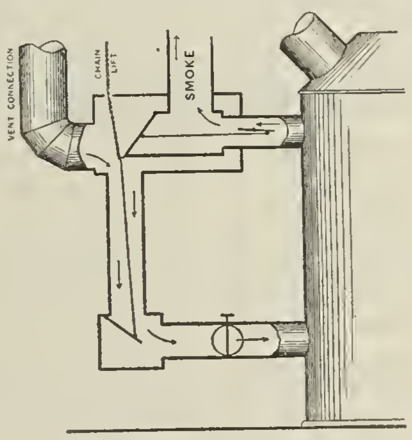

Fig. 7.—The Miller Exhaust Ventilating Connection.

All of the hot air pipes are provided with dampers at the furnace, and all of the hot water and hot air piping exposed in the basement is covered with nonconducting material. The dampers for regulating the draft are so arranged as to be operated from the upper floor by means of chains.

ROTARY SYSTEM OF HEATING.

BY F. B. K.

Having read the ideas of " Iowa " on furnace heating in *The Metal Worker* of March 8, I will state that I am in line with him, as here in Ohio I have advocated and put in inside air ducts for the " rotary system," as he calls it, for the last 10 or 12 years and have been very successful with it. I was the first to start it in my town, which is a college town, and I had a hard time of it for a few years in convincing the people it was not sure death to use such a system. I would like to have " Iowa " give a plan or sketches with description of how he connects the cold air ducts to the furnace. Also what parts of the house he takes to exhaust the air from. I usually take only one pipe from the hall, and it sometimes causes a draft of air toward the cold air register. He also states that he uses water to moisten the air, and I wish he would explain his method of doing it. I use no water in most of the furnaces I put in, the furnace manufacturers claiming it is not necessary. I think it is, or at least it would do no harm. If " Iowa " will give a set of plans and a complete description of his heating system I think there are a good many readers of *The Metal Worker* who would be thankful to him for it, if he thinks that would be sufficient pay for his trouble.

The Story of the Richmond Range.

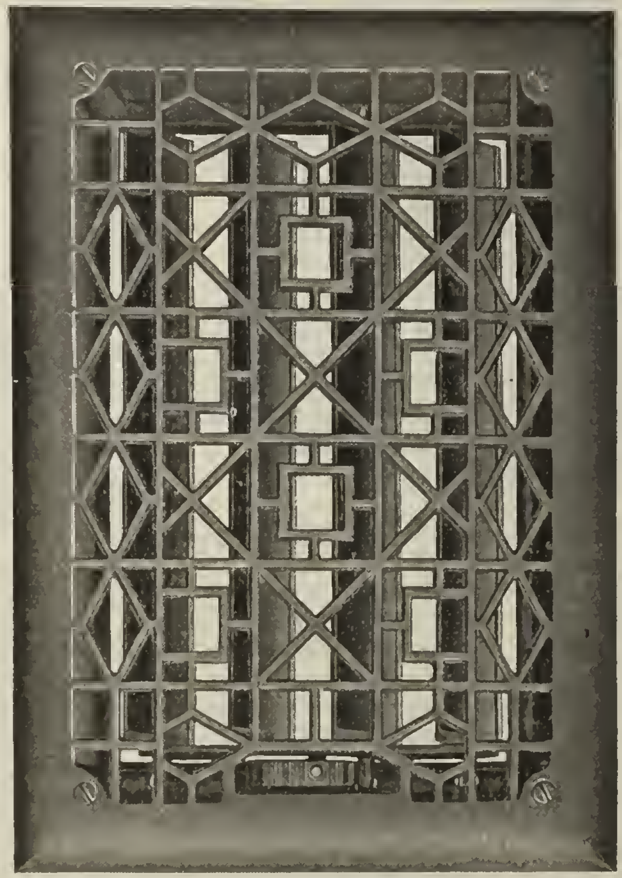
The Richmond Stove Company, Norwich, Conn., have gotten out an attractively illustrated book entitled " The Story of the Richmond Range," which is being distributed in the vicinity of New York by J. M. Litchfield, who is the company's agent, at 105 Beekman street. The story proclaims the many features of merit and the superb finish possessed by all of the Richmond ranges. The Richmond ranges are made in several series, each series consisting of a complete line adapted to the demands of some special line of trade. The finer goods are not only elaborately designed, but handsomely finished. They are provided with hot closets, high shelves, reservoirs, tea shelves, end hearths and cabinet bases, and are also equipped with thermometers in the oven doors. The catalogue also shows the Richmond Oak and the Richmond cylinder stoves, which are made as full revertible flue heaters, and also as air circulators and for heating an additional room. The air tight series Richmond is an oval stove for burning wood from 16 to 22 inches long.

Oak Peninsular Hot Blast Smoke Consumer.

The Peninsular Stove Company of Detroit, Mich., are constantly distributing among their customers attractive circulars calling attention to some of their many leading specialties in the way of cook stoves, ranges and heaters. Among the latest sent out is a folder, printed in colors, relating to the Oak Peninsular Hot Blast Smoke Consumer. The exterior of this heater is rich in appearance, the effects being produced by the judicious use of nickel plate in combination with cast ornamentation. Among the constructive features may be mentioned duplex grate and shaking ring, which can be withdrawn without removing a single plate or bolt; double feed door, circular draft regulator and door frames, having two fitting faces, which are made absolutely air tight. The hot blast attachment supplies the proper quantity of hot air for combustion, while the deflector ring and steel foot rail force the hot air to the floor. The ash pit is made of one piece, thus rendering it air tight, and is equipped with large ash pan and tight closing door. The Never Break steel leg base is of such a nature, it is claimed, as to save time, trouble and expense. The treble jointed fire pot has corrugations extending from the top to the bottom, which supply heated air and facilitate the burning of the fuel all around and in the center. The hot blast smoke consumer is claimed to give a most intense heat with a minimum consumption of fuel, this being accomplished by the air passing through registers in the feed door into the superheating chamber around the top of the fire pot, where it is intensely heated, the perforated blast making a fierce fire, which consumes all gases. A self feeding hard coal heater may be produced by putting in a magazine.

The New Kernan Register.

The Syracuse Stove Works, Syracuse, N. Y., have recently placed on the market an extensive line of improved hot air and ventilating registers, under the name Kernan. The registers are of Græco-Roman design. In addition to the regular smooth faced registers, the company also make a convex face register, as shown in the illustration herewith. These registers, which are made in a variety of sizes, have the advantage of not extending back into the hot air flue, which especially adapt them for use in connection with the shallow heating flues used in partition walls. The manufacturers state that these goods are made with great care and operate smoothly, while the design affords a large open area in the face through which the air can flow freely. A special feature of the device is a patent brass noncorrosive nut case with sleeve, so that in case of necessity the register face can be easily removed from the box containing the valves. This device also enables the operating lever to work freely. The governing rod is pivoted eccentrically to the slats, which have large ends to facilitate a frictionless, easy and noiseless opening and closing, and also adapting them to thermostatic control when desirable. These registers are furnished in different styles of finish and in various colors of bronze, nickel plate and black and white enamel. The company make special claims for the excellent finish which is given to their goods. They are prepared to furnish either slate, soapstone or suitable cast iron borders. The ventilating registers are provided with fixtures to be operated by cords and are made for both side wall and ceiling use. A catalogue recently issued by the Syracuse Stove Works gives full particulars of these goods and will be found of interest by the furnace contractor.



The New Kernan Register.

Morse Brothers, Canton, Mass., manufacturers of the Rising Sun Stove Polish and Sun Paste Stove Polish, advise us that they have largely increased their facilities for making the latter this season, and are now prepared to fill all orders promptly, which they were not able to do during the winter, owing to the excessive demand and inadequate output.

WESTERN IDEAS ON FURNACE HEATING.

BY CONFIDENTIAL.

A correspondent in Minneapolis, Minn., who views the question of the air supply to the furnace from the opposite extreme to that taken by "Iowa," whose contribution under the same head was presented in *The Metal Worker* of March 1, sends us a communication in reference to it, from which some extracts are presented below. We are always glad to present the views of those who are in touch with any branch of trade, except where criticism is the principal feature and where such criticism would tend to controversy rather than to draw out practical information based on experience. Criticism of this character is apt to shut off springs of valuable information, while if the same amount of energy is devoted to suggestion and explanation with the view of improvement, the original contributor may be induced to make further experiments and to give the result of his experience. The extracts from the contribution referred to are as follows:

About a dozen years ago, in consequence of the bad and dangerous methods in vogue in the plumbing work throughout the country, it became necessary to enact laws and frame ordinances in relation thereto. To-day, in consequence, plumbing systems have been greatly improved and the plumber has to know something. He has to pass a rigid examination and his work is inspected. If not done right it is condemned. There never was a time when there was more danger to be feared from defective plumbing than there would be now if the rotary circulation of air in connection with heating systems should come into general use. Think of it. A house of, say, six rooms, occupied by five people, who, with the lamps or gas jets, consume or destroy large quantities of oxygen, with no inlet for fresh air or outlet for air of any kind, heating and reheating, breathing and rebreathing day in and day out, and, to cap all, saturated with air with 6 gallons of water every day.

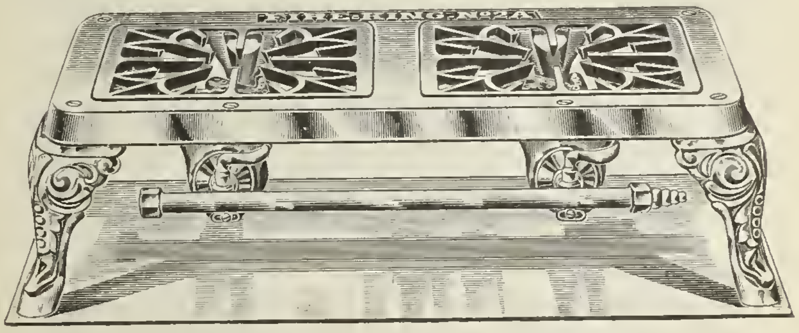
What becomes of all the water, as you cannot destroy a drop of it? Where does it go? Suppose a man having an ordinary furnace should conclude that he must have some moisture for the benefit of his own and his family's health, and having no other means at hand, he forthwith takes a sprinkler and showers every room with a gallon of water, and a gallon will go a long way toward getting a room good and wet. Suppose he continued the practice the next day, expecting his family to remain as occupants. If he persisted his sanity would be questioned. The humidity of the air cannot be very much affected by raising its temperature from a lower degree than that which is generally required for living purposes, say 70 degrees. It is true that at that point it will hold more water in suspension, as none has been lost, and as the lungs readily adjust themselves to any change of temperature. No more water is needed in a warm temperature when the air is rarefied. We breathe deeper, inhale and exhale more air, not to get water or moisture, but oxygen. The lungs give off an excess of moisture.

Under right conditions, 70 degrees of air artificially warmed in any way is not more injurious to the furniture, pianos, &c., than the summer temperature at the same point. What about the 90 and 100 degrees of air which is frequently breathed in the summer time? This is written from an easy chair that has been in constant use 20 years, on a table that has been used for 65 years. Each has endured stove, furnace and steam heat, and both are as firm on their legs and as tight in their joints as when first made. There is a piano in the house that has been in use 20 years. It is seemingly unharmed, except that it does not hold its tone quite as well as at first. A year or two ago a rocking chair was bought at a bargain counter and it fell to pieces within three months with only summer heat to dry it out.

The article also alludes to a large tank for holding water for moistening the air. Can any one imagine a place where a large amount of water would not putrefy and become a veritable cesspool? Would not the water absorb the impurities, and if not, why? In the ordinary course of events how often would such a tank be cleaned? If the air circulating through the house was saturated with water, what would be the result should the temperature of the air recede 40 degrees? Would it not make everything clammy? And what sort of a place would it be for a person with weak lungs, or consumption, or depleted in any way? Suppose there should be a severe case of sickness in such a house in which the air is rotated. Suppose you had a case of infectious disease. Would there be any isolation whatever?

Fire King Hot Plates.

Those who handle gas hot plates will be interested in the new Fire King gas hot plates, which are being put on the market this season by A. Weiskittel & Son of Baltimore, Md., as these new goods are claimed to have some special features. A general view of the new Fire King of the two-burner type is shown in Fig. 1, from which it will be noticed that the top gratings finish flush with the top, and yet can be thrown back on the hinges, as shown in Fig. 2. The burners can be lifted out for cleaning, and are of the latest improved drilled type, cast in one piece, thus avoiding leaky joints. The hot plates are made with one, two and three burners and are finished in nickel.



The Fire King Hot Plates.—Fig. 1.—General View.

PHILADELPHIA HEATER AND RANGE ASSOCIATION.

An interesting meeting of the Philadelphia Heating & Range Association was held a few days since at the Builders' Exchange in that city. The attendance was very good and comprised many of the leading representatives of the heater and range business in the city. Interesting discussions on trade protection and other matters of vital importance to the heater and range trade were discussed. Each member in attendance expressed the feeling that the time had been profitably spent, and that it might pay to have weekly meetings. The association, although not having one-half of the legitimate dealers represented as members, does represent fully 75 per cent. of the purchasing power in the heater and range business. The association is progressing rapidly and enjoys a protection that was thought impossible a year ago. At that time the heater and range business was in a deplorable condition. Anything in the line of heaters, ranges, tin, iron, or anything else could be bought at wholesale prices, but to-day in most lines the association is fully protected. In others they have partial protection; but, judging from what has already been done, full protection is hoped for in the near future, although there are a number of matters yet to be adjusted. These are being brought up in turn. The association invites every heater and range dealer to be present at its next meeting, which is to be held in the Builders' Exchange at 4 p.m., April 9.

ODD PLATES.

George H. Barbour of the Michigan Stove Company gave evidence at Washington last week before the House Committee on Commerce on the proposition to establish a Department of Commerce. Mr. Barbour imparted to the committee some striking facts regarding the Western part of the country, and Detroit in particular, with the idea of impressing the members with the growing importance of that section. He dwelt particularly upon the great Stove works of Detroit, and predicted that the city would soon become a center of iron manufacture. While in Washington, Mr. Barbour had a cordial interview with President Roosevelt at the White House.

The Chicago Furnace Supply Company, Chicago, have been incorporated with a capital of $15,000 for the purpose of manufacturing articles in iron and sheet metal. The incorporators are F. W. Metz, W. E. Williams and D. A. Colbert.

In an article on the possibilities of trade with China a writer in the *British Trade Journal* remarks as follows regarding Stoves and Kitchen Ranges: "In the South of China they would only be used by Europeans. Cooking of all kinds is done by the Chinese on Ranges made of brick and clay, and wood is used almost entirely. The cooking quarters are detached from the house, so that no fumes from the fires or from the cooking ever enter the residences. Of course, the Stoves cost almost nothing, and, as long as labor is cheap, these primitive Ranges will probably remain generally in use."

The Hess Warming & Ventilating Company, 131 La Salle street, Chicago, Ill., are sending out three booklets, one devoted to the Leader Hot Air Furnace; another to the Hess Pneumatic System of Drying and Cooling Grains, and the other exploiting their heating system.

The Reading Stove Works, Reading, Pa., have received a large order for Ranges for shipment to Johannesburg, South Africa. The company, during the past two weeks, have made shipments of their products to Tasmania, Valparaiso and Amsterdam.

The Miller Patent Ventilating System, described in connection with the article, "Modern Furnace Heating," in this issue, is the invention of William Miller, 2 Caton avenue, Brooklyn, N. Y., who has disposed of the right to use the patent in the United States to the Thatcher Furnace Company, 240 Water street, New York. As yet the right to use the patent in other countries has not been disposed of.

The Liberty Stove Company, Philadelphia, Pa., whose incorporation was recently mentioned in these columns, succeed the late firm of Charles Noble & Co., who had been operating the Liberty Stove Works in that city since 1851. C. M. Landenberger is president and H. M. Shipe secretary and treasurer of the new company. The manufacture of Iron King and Liberty Stoves and Ranges, &c., will be continued with new features and improvements, that will be offered in the coming season's goods.

The Somerset Stove Foundry Company, Somerset, Mass., have recently added to their extensive assortment of specialties a new medium priced Range, known as the Ideal Glendale. They will also place upon the market this fall a new Oak Stove, which will be of a character to meet the requirements of those desiring a first-class Heater. The Domestic Glendale Range, made in all the usual modifications, which was put upon the market last year, is proving very popular and the demand is showing a very gratifying increase from week to week. This Range is of attractive exterior and has among other features, a double oven top, perfectly straight from front to back. A neat pamphlet which the company are sending out calls attention to the merits of the Glendale Grand Range, made in a variety of styles and sizes, and which is fitted with a thermometer, by means of which the temperature of the oven can be seen at a glance; and the Somerset Pallas Range, which embodies the modern improvements. The company state that they have been manufacturing Stoves and Ranges since 1854, and they are, therefore, in a position to satisfactorily meet the requirements of the trade.

The Hart & Cooley Company, New Britain, Conn., are distributing a new catalogue and price-list of their Wrought Steel Registers and Ventilators. These Registers are manufactured wholly from wrought metal, so that, it is pointed out, breakage either in use or transportation is practically impossible. Reference is also made to their lightness in weight as effecting economy in freight, and their uniform thickness of 1¾ inches over all for all sizes as affording a great saving in stockroom.

An attractive souvenir in the shape of a match box was distributed to those attending the first annual meeting of the Pennsylvania Retail Hardware Dealers' Association in Pittsburgh, last week, by the H. Adler Company of that city, manufacturers of the Acme Stoves, Ranges and Ovens.

The Faultless Steel Range Company were sufferers from a fire which occurred in their building at 61[illegible] to 621 Austin avenue, Chicago, on the morning of April 1. The building was badly damaged, including the quarters occupied by the company. The loss is largely covered by insurance.

The Standard Blue Flame Oil & Gas Company of Chicago have been incorporated under the laws of the State of Delaware, with a captital stock of $500,000 to manufacture Heating and Cooking Stoves, &c.

Floyd, Wells & Co., Royersford, Pa., are sending out from their New York office, 210 Water street, the announcement that they are now prepared to show a full line of the Irving Ranges and Rosemont Heaters. The New York branch is under the management of R. W. Hillman, who is well known to the trade in New York City and vicinity. The company state that they have a large and complete line of heating and cooking apparatus, including Furnaces of all grades, Wood Stoves, Fire Place Heaters, Self Feeders, Oaks, Cylinders, Air Tights and Laundry Stoves. They also announce that they are now after the business of Stove dealers, and will be glad to send catalogue and prices to those who desire them. The company also issue a circular showing the Sparkle Range, made in 6, 7 and 8 inch holes, and ovens 18 inches square, with end ash pit, reservoir and high shelf, and all of the usual conveniences, handsomely nickel trimmed.

The Great Western Stove Company, Leavenworth, Kan., are planning to erect a large six-story warehouse, to cost $40,000, at Omaha, Neb., to be ready for use this year.

"The Sprayers' Advocate" is the title of an illustrated circular published by the Berger Mfg. Company of Canton, Ohio, in the interests of their Novelty Force and Spray Pumps. It contains information regarding the manufacture and use of these Pumps, and also a number of useful recipes for spraying compounds for the protection of various kinds of trees, plants and vegetables.

A letter from the Chappell Furnace Company, Morenci, Mich., informs us of their incorporation with a capital of $15,000 for the purpose of making the Chappell low down base burning all cast iron coal and wood Hot Air Furnace. The officers are E. B. Rorick, president; C. A. Wilson, vice-president; J. M. Triggs, secretary; W. B. Rorick, treasurer, and W. H. Chappell, superintendent. The officers are experienced business men and the superintendent a furnace maker of 30 years' successful practice. The company are issuing a catalogue giving full particulars in reference to the Chappell Furnace.

PENNSYLVANIA RETAIL HARDWARE DEALERS' ASSOCIATION.

The first annual meeting of the Pennsylvania Hardware Dealers' Association was held at the Monongahela House, Pittsburgh, on March 26 and 27. Nearly 50 firms were represented. The meeting was called to order by President George L. Moore on Wednesday morning, and A. C. Robertson, representing the City Recorder, welcomed the association. President Moore responded with appropriate remarks. A number of addresses followed, in which the speakers expressed their sympathy with the work of the association. M. L. Corey, secretary-treasurer of the National Retail Hardware Dealers' Association, who was present by invitation, took occasion to explain that the Pennsylvania Association was not organized for the purpose of fighting, but for coming together on many vexing questions.

The president appointed the following committees:

PRESS: R. R. Williams, Mr. Dickson, J. T. McKean.
RESOLUTIONS: M. L. Corey, E. D. Everts, Geo. V. Thompson.

The Entertainment Committee in charge of the meeting consisted of J. E. Digby, McKee's Rocks; H. F. Robinson, Charleroi, and George T. Rudolph of Pittsburgh, who performed their duties in a very efficient manner. The banquet given on Wednesday evening was under their supervision and was an occasion of much enjoyment.

A. Q. Casselberry of Pittsburgh, chairman of the Committee on Constitution and By-Laws, made a report, which, with some minor changes, was adopted. A number of practical questions in regard to the conduct of business and improvements which might be made in store management, received attention from the convention, among which was the matter of keeping track of cash handled in a store. Various suggestions were made by the members as to the prevention of loss through dishonesty or neglect.

The executive sessions of the association were held on Wednesday evening and Thursday morning with a large attendance of members. On motion it was decided that the next annual meeting be held in Pittsburgh.

In the course of the convention S. S. Bryan of Titusville read an interesting paper on "The Necessity of Organization," and a paper on "Progress" was read by A. Q. Casselberry.

J. F. Frye of Charleroi, former secretary of the association, resigned his office and J. E. Digby of McKee's Rocks was chosen to succeed him, making the staff of officers as follows:

PRESIDENT, G. L. Moore, Brownsville.
VICE-PRESIDENT, Geo. J. Rudolph, Pittsburgh.
TREASURER, B. A. Maggini, Braddock.
SECRETARY, J. E. Digby, McKee's Rocks.

The following were elected members of the Executive Committee in accordance with the new constitution:

Samuel McKnight, Allegheny.
C. J. Kirk, New Castle.
A. M. Gregg, Monongahela.

At the banquet on Wednesday evening R. H. Geiger acted as toastmaster. The principal speaker was James Francis Burke, whose topic was "Pittsburgh." Mr. Burke delivered an eloquent address, laudatory of the Iron City. Other addresses were made by T. James Fernley, secretary-treasurer of the National Hardware Association; R. R. Williams, hardware editor of *The Iron Age*, and M. L. Corey, secretary-treasurer of the National Retail Hardware Dealers' Association.

Enameled Tea and Coffee Pots and Pans.

The Cleveland Stamping & Tool Company, Cleveland, Ohio, manufacturers of Lava enameled solid steel hollow ware, have recently begun the production of a new line of tea and coffee pots, dish and rinsing pans and the Utility kettle, all of which are made in mottled brown and white. The coffee and tea pots have wood handles and enameled covers, and are made in 1½, 2, 3 and 4 quart sizes. They also make seamless deep dishes and rinsing pans in 10, 14, 17 and 21 quart sizes. The Utility kettle for milk, beer, oysters, &c., has a capacity of 1½, 2, 3 and 4 quarts, all of which are shown in a supplement to their 1901 catalogue.

A VIRGINIA RETAILERS' ASSOCIATION.

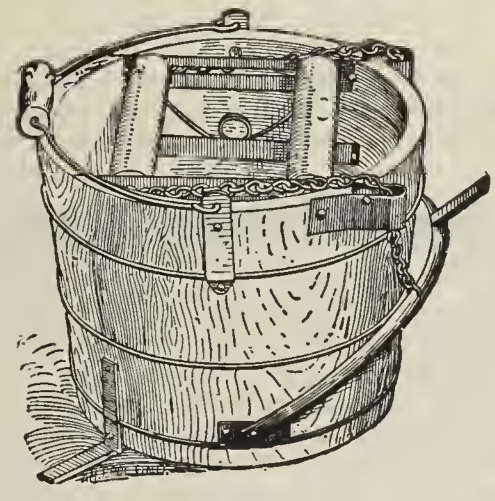
A charter of incorporation has been granted to the Retail Stove and Sheet Metal Workers' Association of Norfolk, Portsmouth and Berkeley, Va. The objects of the association, as set forth in the charter, are "to aid and benefit the members by bringing them into closer social and business intercourse, elevating the standard of business and securing fair and proper business methods." The capital stock of the association is to be not less than $500 nor more than $5000, divided into shares of $50 each.

The officers of the association are: P. J. Riley of Portsmouth, president; W. C. McGinley of Berkeley, vice-president; W. M. Bohn of Norfolk, recording secretary; E. H. Odenthal of Norfolk, financial secretary, and George W. Battley of Norfolk, treasurer. These, with the following, are to compose the Board of Directors: W. H. Barnard, J. V. Kiernan, George B. Crow, B. H. Evans, James Lilliston, E. Kavanaugh, John T. Howard, George E. Watson, W. J. Messick, W. J. Shepherd, Joseph L. James and Frank P. Smith of Norfolk; J. E. Fentress and J. W. West of Norfolk County; R. L. Albert, Oscie Dashiell and A. L. Cherry of Portsmouth.

The Retail Stove and Sheet Metal Workers' Association of Norfolk, Portsmouth and Berkeley, which has been in existence for some time, is one of the most flourishing organizations of its kind in the United States. Among the advantages secured are that a general contractor can get no estimates for work if it is proved that he has unjustly failed to pay a member of the association for work done. A general contractor is also required to give bond for payment of the price on contract, or a notice is served on the owner holding him responsible. Other rules are that no member is allowed to use any new material furnished by the owner, nor is any member allowed to put in or repair stoves or furnaces bought by the owner in other cities. Friendly and social intercourse between competitors has also tended to add to the pleasure and soften any asperities of business. The members of the association make it a rule to confine their purchases to those dealers who sell only to its members.

The Beach Patent Mop Wringer.

The Beach Novelty & Wringer Company of Mansfield, Ohio, are placing on the market the Beach patent mop wringer, of which an illustration is presented herewith.



The Beach Patent Mop Wringer.

The article consists of a cedar pail, seasoned maple rolls, solid brass springs, steel chain and side bars, wrought iron foot holds and levers and two small pulleys of cast iron, all put together with screws. The entire weight, ready for shipment, is 8 pounds. The manufacturers claim that the pails cannot dry out and fall apart, as they are put together with wire hoops sunk in grooves in the wood and welded by electricity. The wire springs are protected by iron guards from catching in the mop. The whole device is made to stand the most severe and constant use. The wringer wrings all kinds of shapes or sizes of mops. It is also adapted to wringing dirty cloths without the need of touching them with the hands, using a pair of pincers to draw them through the rolls. In mopping floors, porches, &c., hot water in which purifying or disinfecting chemicals are dissolved can be used, thereby obtaining the best possible sanitary results. The hands need never come in contact with the mop or cloth. The claim is made that in wringing the mop in the old way, by twisting with the hands, the dirt is left in the center of the mop, while with the use of the Beach wringer not only is the water excluded, but it carries with it all impurities and leaves the mop clean.

Neverslip Cover.

The Neverslip Tin Cover Company, Watertown, N. Y., are manufacturing the Neverslip tin covers for kettles and saucepans, as here shown. Fig. 1 illustrates the cover as put on the market. Fig. 2 represents it in position on a saucepan, Fig. 3 being another application of it to a kettle. The purpose of this form of cover is to enable the housekeeper to drain a kettle or saucepan without risk of injury from scalding water or steam.

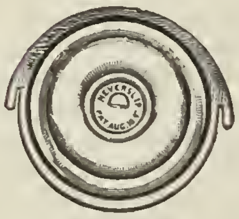


Fig. 1.—Neverslip Tin Cover.

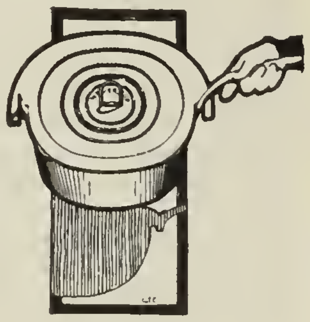

Fig. 2.—Method of Using on Saucepan.

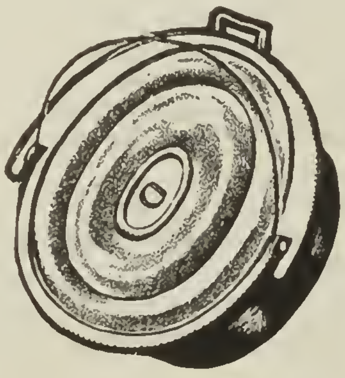

Fig. 3.—As Used on Kettle.

The cover is so made that the ears on the sides of the cover slip under the ears of kettle or saucepan, thus keeping it in proper position when pouring off hot water.

Stove and Hardware Dealers.

Eureka Refrigerator Company, Indianapolis, Ind., have issued a new catalogue of Opal Refrigerators. These Refrigerators are made in five regular stock sizes in two different styles, opal, all opal enamel inside and out, Nos. 1, 2, 3, 4 and 5, and oak cases, with opal enamel lining, Nos. 51, 52, 53, 54 and 55. Special sizes will be built to order to fit any desired space. The opal enamel used in their Refrigerators, which have six non-conducting walls, is referred to as a pure white solid enamel, made in large perfectly smooth sheets. The frame is made of 2½ and 3 inch poplar wood, thoroughly seasoned and kiln dried. The trimmings are solid brass, heavily nickel plated.

Stephenson & Garrard have purchased the stock of Hardware, Stoves, Tinware, Harness, &c., of the Stephenson Hardware Company, Oxford, Ohio, and will continue business in the same store. The receipt of catalogues, circulars, prices and terms from manufacturers in the above lines will be appreciated by the new firm.

The Bronson-Walton Company, Cleveland, Ohio, have issued an illustrated catalogue in *fac-simile* colors of Wall Coffee Mills, to hold 1 pound of coffee in the bean, the canisters of which are both metal and glass, square and round, those with metal canisters being lithographed. They also make Decorated Square Box Mills, Roasters, Bakers and Wire Rope Clamps.

Boyer & Osborne have engaged in business at Battle Creek, Neb., carrying a general line including Hardware, Tinware, &c.

E. C. Whitlock has opened a Hardware store at Kinross, Iowa, with tin shop and Pump department in connection with it.

W. S. Brown has succeeded Clapp & Brown in the Hardware, Stove and Plumbing business in Cherryvale, Kan.

Bluffton Mfg. Company, Bluffton, Ind., are sending out a circular in which they remark, apropos of the season, "28 years in the business proves that we are no spring chicken." Illustrations are given of their American Rotary, Round, Square and Open Washing Machines.

H. Clay Lynn, 409 Brook avenue, Richmond, Va., is desirous of obtaining Brass Milk Spigots suitable for delivery Milk Cans from 10 to 20 gallons capacity. He wishes to secure a Spigot that is easy to keep clean and that has a large opening. Mr. Lynn also desires to obtain catalogues and price-lists from manufacturers of goods in this line, and also of dairy goods generally.

Howe & Flint, who have been in the retail Stove business at 51 Union square, Somerville, Mass., for the past 27 years, have dissolved partnership. The business will be continued by William S. Howe.

C. A Watson has succeeded A. Watson & Son at Sheridan, Mo., dealers in Hardware, Stoves, Farm Implements, Sporting Goods, Paints, Buggies, furniture, wall paper, &c. The new proprietor will make some improvements in the establishment, including additional shelving and fixtures, although the store is referred to as already one of the most complete and best arranged in Worth County.

Milford Mfg. Company, Milford, N. Y., have recently been incorporated with a capital stock of $6200. The directors of the company are: C. J. Armstrong, A. S. Luther, G. G. Whitney, W. B. Whitney and G. L. Lyon. The company will succeed to the business of Lyon & Whitney, and will continue the manufacture of Ball Bearing Egg Beaters and other novelties.

B. W. Henderson has succeeded Henderson & Cleveland in the Hardware, Stove and Farm Implement business in Rodney, Iowa.

Hawley & Dewhurst, Blanchard, Iowa, have taken into partnership with them W. J. Boyle, and the style of the concern is now Hawley, Dewhurst & Boyle. They have erected a new brick building for their Implement business, and changed their old building into a Hardware store. They are now handling Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, &c.

Ed. McGann and J. Carroll Smith have formed a partnership to carry on a retail Stove and Hardware business at Oswego, N. Y., under the firm name of McGann & Smith. They will open a store about May 1 at the corner of East Second and Utica streets, with a complete stock of Builders' and General Hardware, Stoves, Ranges, &c.

Malleable Glass.

It is announced that Louis Kauffield, a well-known glass manufacturer of Matthews, Delaware County, Ind., after experiments covering two years, has discovered a method for making malleable glass, which has been considered as one of the lost arts. Malleable glass, it is said, is not sensitive to sudden changes of heat and cold, and may be molded very much after the manner of iron. Those who have tested the material produced by the Kauffield process are reported to be convinced that an entirely new and valuable product has been discovered, which may be applied to all kinds of glass ware and which is calculated to revolutionize the glass making industry.

Amended Plumbing Regulations.

Perez M. Stewart, Superintendent of Buildings for the borough of Manhattan, New York City, has posted amendments to the plumbing and drainage rules and regulations of his bureau as follows:

Paragraph 11 is hereby amended so as to read as follows:

" Once in each year every employee or master plumber carrying on his trade, business or calling in the city of New York shall register his name and address in the office of the Bureau of Buildings in the borough in which his place of business is located."

Paragraph 111 is hereby amended by adding at the end thereof these words:

" A plumber proposing to do work in a borough other than that in which he is registered shall present his certificate at the office of the Bureau of Buildings in that borough before commencing work, so that the fact of his having been properly registered may be recorded."

Section 79. Substitute the following:

" Section 79. A fresh air inlet must be connected with the house drain just inside of the house trap; where underground, it will be of extra heavy cast iron. It must extend to the outer air and finish with a return bend at least 1 foot above the grade and 10 feet away from any window or cold air box. When this arrangement is not possible the fresh air inlet must open into the side of a box not less than 18 inches square, placed below the sidewalk at the curb. The bottom of the box must be 18 inches below the under side of the fresh air inlet pipe. The box may be of cast iron, or it may be constructed with 8-inch walls of brick or flagstone laid in hydraulic cement. The box must be covered by a flagstone fitted with removable metal grating, leaded into the stone, having openings equal in area to the area of the fresh air inlet, and not less than ½ inch in their least dimension. The fresh air inlet must be of the same size as the drain up to 4 inches; for 5-inch and 6-inch drains it must not be less than 4 inches in diameter; for 7-inch and 8-inch drains not less than 6 inches in diameter, and for larger drains not less than 8 inches in diameter, the removable portion of grate to be at least 8 x 12 inches in area. An automatic device approved by the Superintendent of Buildings may be used, when set in a manner satisfactory to the said superintendent."

Section 97. Substitute the following:

" Section 97. No form of trap will be permitted to be used unless it has been approved by the Bureau of Buildings, and no masons' cesspool, bell, pot, bottle or D trap will be permitted, nor any form of trap that is not self cleaning nor has interior chamber or mechanism, nor any trap, except earthen ware ones, that depend upon interior partitions for a seal."

Section 119. Substitute the following:

" Section 119. In lodging houses the water closet and urinal apartments must have a window opening to the outer air; if three stories or less in hight, they may have such window opening on a ventilating shaft not less than 10 square feet in area."

Section 131. Substitute the following:

" Section 131. In lodging houses there must be one water closet on each floor, and where there are more than 15 persons on any floor there must be an additional water closet on that floor for every 15 additional persons or fraction thereof."

Change the number of section 134 to section 133 and substitute the following:

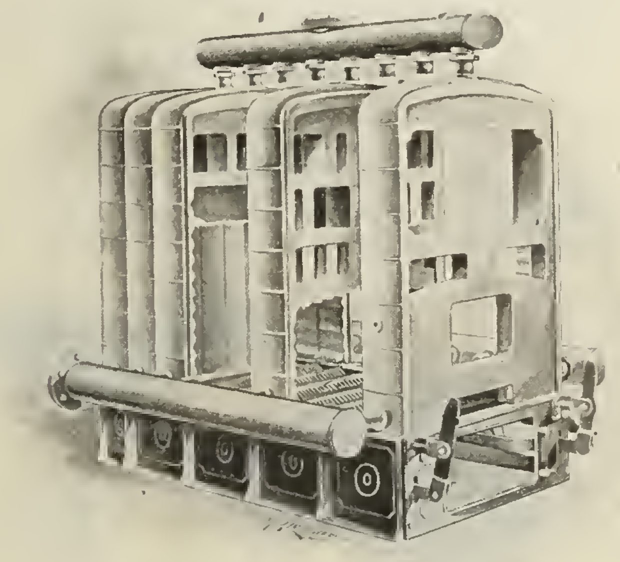
" Section 133. Water closets and urinals must be flushed from separate cisterns on each floor, the water from which is used for no other purpose; where flushometers are used, they must be supplied from separate tanks provided for that purpose, and in no case are connections to be made direct with the water service pipe."

Plumbers' Marble Men Organize.

Representatives of most of the firms in the United States engaged in the manufacture of plumbers' marble slabs met last week at the Gibson House, Cincinnati, Ohio, to permanently organize the Marble Manufacturers' Association of the United States. Among those present were the following: John R. Hugg, Evans Marble Company, Baltimore, Md.; C. L. Hillgarten, Hillgarten Marble Company, Baltimore, Md.; F. J. Lautz, Lautz Marble Company, Buffalo, N. Y.; Theodore Ahrens, Standard Sanitary Mfg. Company, Louisville, Ky.; W. E. Higbee, representing the Vermont Marble Company, Rutland Marble Company and the Columbian Marble Quarry Company; Jos. Krulish, representing the New York manufacturers; L. D. Lawnin, Illinois Marble Company, Evansville, Ill.; B. L. Pease, Tennessee Producers' Marble Company, Knoxville, Tenn.; H. M. Hoelscher, L. Wolff Mfg. Company, Chicago, Ill.; John M. Mueller, Standard Marble Works, Cincinnati, Ohio. The Buckeye Marble Works of Cincinnati, Ohio, were also represented.

The American and Advance Boilers.

After many years of experience in the manufacture of steam and hot water heating boilers, of both the push nipple and screw nipple with header type, the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., announce that they have decided to abandon the push nipple type of construction and construct an entire new line of patterns for the American and Advance boilers with 16 and 22 inch grates and headers with screw nipples. This is done with a view for providing a boiler which can be more readily set up and made tight, and more readily repaired in case of necessity. When these boilers are complete the company will have a line of sectional boilers of the header type, ranging in capacity from 400 to 6100 square feet of direct radiation for steam, and from 600 to 10,000 square feet of direct hot water radiation. In the accompanying illustration a partly assembled boiler of this type is shown, from which a good idea can be had of the fire and flue surface presented and also of the fire and water travel. All of the American and Advance boilers for steam or water have the same kind of base and grate, and having a bridge wall, will be furnished with iron partitions to be placed in the base, and the heating contractor can brick the ash pit to meet this partition. Either fine or regular grates can be furnished to suit the fuel to be used. Rubber gaskets for header flanges and candle wicking for lock nuts will be supplied with the boiler. Complete directions for erecting as well as for operating the boilers are sent in the box with the trimmings. The company are sparing no effort to make their product convenient and satisfactory to both the contractor and the user.



The American and Advance Boilers.

Those who are engaged in the heating trade have derived no little benefit from the wide distribution of the pamphlet, "The Home Successful," circulated by the American Radiator Company of Chicago, which explains the advantages of heating houses by means of steam and hot water. The pamphlet has not only attracted attention, but it has been widely read owing to the character of the illustrations, which bring out many of the points in the reading matter in a manner to make a lasting impression. Those who read it are very apt to send an inquiry for an Ideal Boiler, or the American Radiators, to their local heating contractor.

Traps and Trapping.

The Use and Misuse of Traps as Applied to Plumbing.

BY OLIVER TWIST.

What a Trap Is.—To begin at the beginning, it might be well to state that a trap, as used in the plumbing business, is a device to prevent the passage of a vapor or sewer gas through a pipe by the interposition of a denser body, usually water. In its simplest form it consists of a downward loop or bend in a pipe, that will retain a sufficient amount of water to accomplish the purpose. In order to be effective it must hold enough (in excess of what is required to fill the diameter of the pipe) to guard against the various agencies that are at work to unseal the trap. In Fig. 1 the body of water between *r* and *t* is the seal. The hight of this body must not be so great as to stop the free passage of any liquids or waste products that would be properly discharged through the trap. Some traps are so constructed that this invariably happens. The water gets through, but so many scraps of foreign matter are retained that a barrier or stoppage is formed which finally makes the fixture to which it is attached useless, until the plumber is called in to remedy the trouble. A good trap should be self cleansing.

A Short History.—As late as 1750 the principal cities of the world were practically without plumbing. People were allowed to throw out into the streets all kinds of refuse and filth. It is said that the first trap used in England, as applied to a fixture, was in 1775, when a man named Cummings took out a patent for a water closet trap, shown in Fig. 1, which had beneath it the full pipe S. It was about this time that plumbing work was introduced into the homes of the wealthy and into the upper rooms of houses, but it was of a very unsanitary character.

The form of trap shown in Fig. 2 is known as the D trap, and was in use in 1790. With some slight changes in shape and method of manufacture it continued in use for many years. It was made usually of sheet lead with soldered joints, and was of large size, which of course was a detriment to the action, preventing the interior, which exposed a large surface, from being thoroughly scoured. Thus it was a gas generator, and, having no ventilation, the dip pipe often corroded so as to allow the sewer gas to pass on up into the house, while the body of the trap might remain water tight. Thus it was possible to have a trap for protection against sewer gas which gave no protection and was actually in many cases a source of disease. Later on, as plumbing appliances increased, it was a favorite plan to carry the water pipe from sinks, basins, &c., into a stone drain, where a depression was made to hold 8 or 10 inches of water, into which the ends of the pipe dipped. P. J. Davies, in his work on plumbing, says that in England in 1865 it was customary to use a flower pot with a little cement in the bottom, thus forming a bowl into which the end of the waste pipe was dipped.

-Fig. 11. Bell trap.-
-Fig. 12.-Ineffective Trapping

Traps and Trapping.

Kinds of Traps in Use To-Day.—They are very many, at least in name. Perhaps the most generally used are the round section seamless lead traps that have been named after the letter their shape suggests. Fig. 1 is called an S trap. Fig. 3 half S trap, Fig. 4 a three-quarter S trap, Fig. 5 a vertical or bag trap and Fig. 6 a running trap. Being round in section, they are easily attached to the various couplings and waste and vent pipes, and are made in all the various weights and sizes to suit the pipes to which they are to be connected. The trap shown in Fig. 7 is used a good deal in some localities under the floors of bathrooms, &c., to take the waste from baths, or basins. It is hard to siphon out, and is likely to accumulate dirt or grease on the surface of the water.

The advent of the exposed plumbing work brought a demand for traps of a more ornamental character, which are to be had made of cast or drawn brass, nickel plated of such varied shape and styles as to make their enumeration impossible here.

Another class are the anti-siphon traps, that contain a mechanical seal. The mechanical seal consists of a ball or float that forms a valve by being held up against the inlet of the trap, as in Fig. 8 and 9, by its buoyancy, which in neither case is sufficient to prevent the free passage of water. These traps are for use in connection with baths or basins where the discharge is not likely to be very dirty, as from sinks, &c.

A trap for use in connection with hotel sinks or in any place where quantities of grease are likely to be discharged into the waste pipes is shown in Fig. 10. It is designed to prevent the choking of waste pipes from grease by intercepting it in the trap, where it accumulates on the surface of the water, and from whence it may be removed through a large cover provided for the purpose. In order to add to its efficiency, a water jacket is provided in some forms of this trap which allows the water drawn through the bib at the sink to first pass around the outside of the trap chamber, thus chilling the contents and causing the grease to form into a cake on the surface.

Fig. 11 shows the bell trap, the seal of which is formed by the bell dipping into a pool of water contained in the chamber shown. These traps are made of cast iron with brass gratings and are used very often in the draining of cement floors and such places where the body of the trap is out of sight and the brass grating finished flush with the surface of the floor. They also used to be attached to cast iron sinks, but were not a success, for that purpose at any rate. They have the drawback that they quickly loose their seal by evaporation, because the quantity held is small and shallow, and it is easily siphoned.

Traps are also made of cast iron in the various sizes and weights corresponding with the soil and drain pipes in connection with which they are intended to be used, as well as of vitrified earthen ware for use with tile drains, &c. All of these traps should be provided with cleanouts, that are water and gas tight, preferably with brass screw threads, and in the large sizes should be of sufficient diameter to admit the hand to remove any large substance that might become fast in them. Flap valves or check valves should not be depended upon to seal soil or waste pipes, as matter lodging under the flap or check will prevent their closing.

How a Trap May Become Ineffective.—Traps may lose their seal and thus permit the passage of sewer gas through siphonage, evaporation, back pressure, oscillation or momentum and capillary action. They are sometimes made useless by mistakes in the connection of vent pipes and through bypasses. Siphonage is brought about by the creation of a vacuum on the sewer side of the trap, often caused by the sudden discharge from a fixture completely filling the waste pipe and rushing past the various branches connected with the same, where the traps are not vented or where the vent pipes may be obstructed. This may be better understood by referring to Fig. 12, in which a bathtub on an upper floor is shown connected with, say, 1½-inch waste pipe, into which is joined the waste from a wash basin on the floor below, both fixtures being trapped and not ventilated. If the contents of the tub be discharged there will be a column of air followed by a column of water like a plug, completely filling the vertical pipe and descending with considerable velocity. This may cause the pressure on the sewer side of the basin to exceed the atmospheric pressure on the house side, thus forcing sewer gas into the room by back pressure. The water column following, however, and rushing past the branch will reverse the conditions and create a suction in the basin waste and cause the basin trap to be siphoned out sufficiently to allow sewer gas to pass.

Back pressure occurs not only in the manner just mentioned, but where ventilation is not provided and the outlet of the sewer becomes closed by tides, heavy rain storms, or by the manholes in the streets becoming clogged by snow or ice.

Momentum or oscillation of water in traps is caused by a strong draft or wind blowing through the soil pipes and causing the contents to oscillate or wave out. Capillary action empties traps through the peculiar molecular attraction which causes a liquid to rise through a tube of slender bore, or through cloth or string. When the lint from towels gets into a trap with one end immersed in the liquid and the other hanging over the dip, the water will climb up and over. The last two mentioned causes are not likely to give much trouble in actual practice.

It has been asked if the water in a trap will absorb gas and emit it again. It is true that water will absorb gas, but not enough to be objectionable. Of carbonic acid gas it is said to absorb an amount equal to its own volume and of ammonia 780 times its bulk.

The Proper Use of Traps.—There is a wrong place for traps, and right and wrong way to use them. It is also quite possible to have too many. Sometimes the best way to learn how to do a thing right is to show how it is to be done wrong, so as to know what to avoid. It should be remembered that every foot of drain, soil or waste pipe is to some extent a gas generator; that they are conveyors of sewage, which is a combination of water mixed with all kinds of refuse and waste matter, soap, grease, kitchen slops, human excrement, vegetable and animal substances, &c., which it is very desirable to have removed from the premises as quickly as possible; that sometimes many particles are left behind the flush of water that is designed to remove them; that decomposition and chemical changes are taking place; that disease germs live and multiply there; that a combination of gases known as sewer gas is continually forming, and that to have sewer gas in the home, to breathe it and live in it is highly dangerous, productive of disease and death. Probably no one will admit that it is better to be without the conveniences of modern plumbing fixtures altogether than to run any risk of losing from the home through the effects of bad plumbing work one who is dear. It is plain, however, that any agency that will secure the exclusion of sewer gas while allowing the use of these manifold plumbing appliances that we cannot, in the cities at least, possibly get along without, is not a luxury but an absolute necessity. To this end plumbing laws and ordinances have been framed to guide the plumber as to the proper use of traps, and while some laws are at variance with each other on some questions (for instance, the interception trap at the entrance of the sewer to the house drain) they all agree that the proper place for a trap is as near to the fixture as it is possible to have it, and that in almost every instance each fixture should be trapped separately.

It is also admitted that dead ends of pipes should be avoided; that ventilation is the means to that end; that the whole plumbing system should be ventilated by a full size pipe to a point above the roof, and that traps, as a rule, should be ventilated, because otherwise they would be "dead ends." It is generally conceded and almost invariably demanded that there shall be a main trap to separate the sewer from the house drain, commonly called "interception" trap, because it is supposed to intercept the passage of disease laden air that may exist in the street sewer.

A trap having a shallow seal should not be used where water is likely to flow through at rare intervals, such as at area drains, leader pipes, subsoil drainage, &c. All such places should be protected by traps having deep seals from 6 to 12 inches, as a protection from evaporation.

Sure Grip Malleable Tank Lugs.

The Racine Tank Lug Company, Racine, Wis., are manufacturing the Sure Grip lugs, to be used in fastening the bands of tanks. They are made in a variety of styles, several of which are herewith illustrated. Fig. 1 shows a lug for two bolts, two key wedges being used side by side. This lug is used for bands exceeding 3½ inches in width. Fig. 2 shows a single bolt lug. Fig. 3 shows a single bolt lug with the side cut away to expose the key wedge and band. The lugs are made of malleable iron, and are referred to as being not only simple and easily applied, but as very strong.

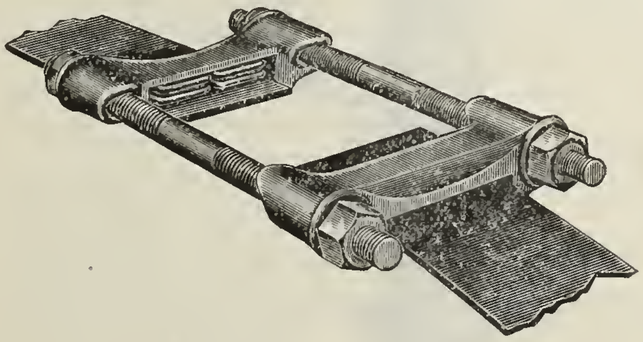

Fig. 1.—Lug for Two Bolts.

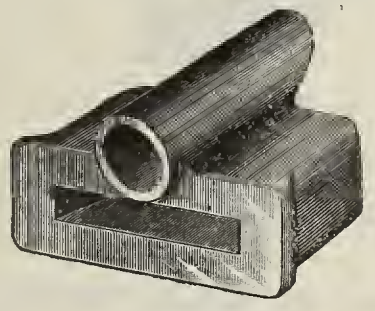

Fig. 2.—Single Bolt Lug.

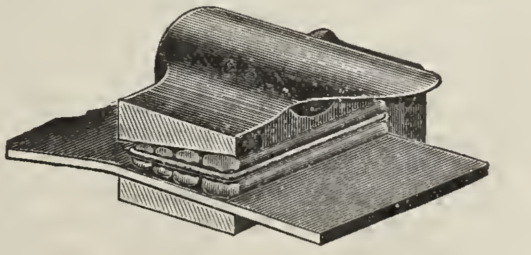

Fig. 3.—Showing Key Wedge and Band of Single Bolt Lug.

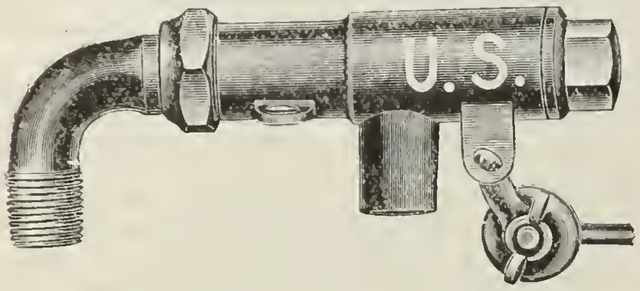
U. S. High Pressure Ball Cock.

The ball cock is considered one of the most important features of a plumbing system in a building, inasmuch as a ball cock of small area and cheaply made will drip, sizzle and sing. In the accompanying illustrations is shown the U. S. high pressure ball cock, which is being manufactured by the Julian D'Este Company, 24 Canal street, Boston, Mass. This ball cock is said to have a balanced valve and a waterway of full size. It is made in all sizes, from ½ to 4 inches, with a renewable seat of the best bronze metal. The company guarantee it to work equally well under either low or high pressure, and claim that it will not hammer even under the pulsation of a pump. Fig. 1 shows the ball cock as arranged for tanks having a top supply, and Fig. 2 shows it as arranged for tanks having a bottom supply. It will be noted that the rod to which the ball is attached is connected with the cock, so that it is adjustable. The company issue circulars giving full particulars of these goods, which can be secured on application.



The U. S. High Pressure Ball Cock.—Fig. 1.—For Top Supply.

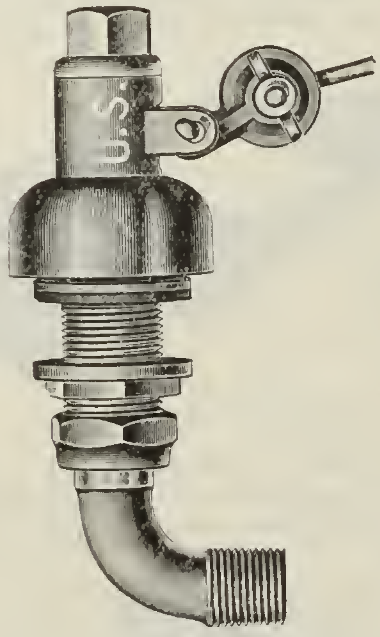


Fig. 2.—The Bottom Supply Cock.

New Quarters of Kellogg-Mackay-Cameron Company.

The Kellogg-Mackay-Cameron Company, manufacturers of steam and hot water boilers and fitters' supplies, are now occupying their new quarters in the Clow Building on the northeast corner of Lake and Franklin streets, Chicago. This building is a very large structure, and provides them with facilities vastly superior to those afforded by their old location. It is six stories high and has a large basement with storage accommodations extending under the sidewalks, thus affording a great deal of room for heavy stock. The basement also provides plenty of room for an electric light plant, pipe cutting and threading machines, &c. The offices are located on the ground floor and enjoy ample light from the windows on Franklin street, thus enabling the officers and clerical force to enjoy natural instead of artificial light, which is greatly appreciated. A portion of the same floor will be used for the display of samples. The rear of the ground floor is partly used as a shipping room, while a mezzanine floor over this department gives ample room for bookkeepers and stenographers. The upper floors will be used for storage purposes, the building being so substantially constructed that even the heaviest articles can be safely carried there. A large freight elevator in the rear enables all goods to be conveniently transported from one floor to another. The location of this building is admirable. Fine facilities for receiving and shipping goods are afforded on Franklin street on the side and on a large alley in the rear. It is in the heart of the city, and is thus conveniently situated, not only for the local heating trade, but also within easy reach of all the freight depots, either rail or water. The officers of this company are to be congratulated on the selection of this building, which could hardly be better adapted for their purposes had it been specially built for them.

The Pierce Sanitary Wood Work.

With the fine enameled iron goods, sanitary earthen ware and nickel plated furnishings used in the equipment of the modern bathroom, it is necessary that the wood work provided should be in every way in harmony with the fixtures and the tiled walls and floors. The Pierce sanitary wood work, which has been put on the market by the Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y., is said to have already gained a reputation for design, workmanship and finish, and also for durability in use. In Fig. 1 we present a view of the Pierce low down tank for flushing wash out and siphon jet closets. These are made in plain and quartered oak in different shades of color and quality of finish, and equipped for either push button, lever or pull. The Pierce closet seat and cover shown in Fig. 2 is made in plain and quartered oak, and in different styles of finish. Great care has been taken in selecting the materials and in the finish of these goods, and they are recommended highly to the plumbing trade.

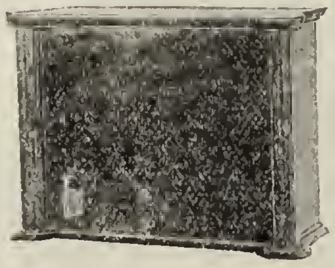

Fig. 1.—Low Down Tank for Closets.

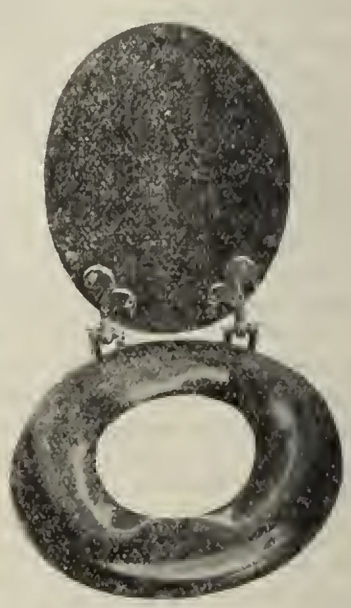

Fig. 2.—The Pierce Closet Seat.

The Pierce Sanitary Wood Work.

The Gurney Heater Mfg. Company, Boston, Mass., are calling special attention to their Heavy Duty Bright Idea Steam and Hot Water Heaters. These Heaters are of the vertical sectional type, and are made in a variety of sizes, adapted for carrying from 900 to 7000 square feet of direct steam radiation, and from 1500 to 11,500 square feet of direct hot water radiation. These Heaters are said to have passed through the winter with highly satisfactory results. Those who are called upon to install heating systems, where Boilers of large power are required, are invited to investigate the company's Heavy Duty Bright Idea Boilers.

TO PROMOTE EXPORT TRADE IN PLUMBERS' SUPPLIES.

A striking indication of the rapidly growing importance of the trade in plumbing fixtures and supplies is afforded by the latest move made in the direction of stimulating the export trade in this line of goods. As a result of many years' experience the manufacturers throughout the country have learned the futility of multiplying the source of manufacture. In view of the overproduction that inevitably follows, in time, when the demand again becomes normal after a period of unusually active business, the need of an outlet for their surplus product has been recognized by all the manufacturers of plumbers' goods. To market the same without disturbing the regular trade and creating a war of prices, which is usually ruinous to the majority of the manufacturers, has been one of the most important problems of the trade.

Many attempts have been made to create a market for these goods abroad, but they have only resulted in partial success in some lines, while absolute failure has been met with in others. This has been due primarily to the lack of experience in handling foreign trade and ignorance as to the requirements of the foreign buyer. Inexperienced salesmen, representing various and often incongruous lines, do not impress the larger buyers abroad with that confidence which is so necessary to the building up of a substantial business. It has become evident that this subject demands careful study and attention if our export business is to be built upon a stable and permanent foundation. With this object in view several large manufacturers of plumbing supplies have secured the services of H. H. Sommer, a man of well-known ability and long experience in this particular line, as their representative abroad to place their goods directly from the American manufacturer to the European consumer. Mr. Sommer, who, for the past seven years has managed the New York branch of E. S. Wheeler & Co. of New Haven, Conn., manufacturers of plumbers' fixtures and supplies, has severed his connection with that house in order to devote his time to the export trade. He will be found at 12 Cliff street, New York, until about June 1, after which date he expects to sail for Europe to enter upon his work there.

It is believed that the lack of success of American commission houses, who have been selling through foreign commission houses, may be obviated by direct personal representation. It is true that individual manufacturing concerns in the plumbing supply field have sent capable men abroad at large expense and have succeeded in securing a certain amount of trade. But the line is so diversified that no single manufacturer can hope, by his own efforts, to gain any very substantial results. In order to make a complete success, the kindred lines that together form a symmetrical whole must not conflict, and the cost of selling these several lines must be reduced to a minimum of expense; in fact, so small as not to become a burden to the producer nor enhance the price of the goods. This condition would seem to be in the way of being met by the plan now proposed, which appears to be perfectly feasible and practical and which, moreover, holds out a promise of benefit to the American plumbing goods industry at large.

A Test of Heating and Ventilating Systems.

For some time past the authorities of the city of Buffalo, N. Y., have been endeavoring to learn the best method of heating and ventilating school buildings, where a large quantity of air is supplied to each pupil and a frequent change of air is made in the building. This has resulted in the arrangement of a contest between heating systems designed by Professor S. H. Woodbridge of the Massachusetts Institute of Technology, and the Buffalo Forge Works of Buffalo, N. Y. The system which will represent the Buffalo Forge Works in the test is installed in Public School No. 16 or 19, in Buffalo, and the system representing the ideas of Professor Woodbridge is now being installed in School No. 42 in that city. Professor R. C. Carpenter of Cornell University and William Kent of New York have been recommended as judges, and whichever system proves the more satisfactory, the City of Buffalo will receive a contribution of $2000 for charitable purposes. Such a contest of efficiency of blower heating and ventilating systems will be of wide interest, and cannot be other than beneficial to this branch of trade.

Ideal Boilers.

The American Radiator Company, whose general offices are in Chicago, with branches in New York, Buffalo, Philadelphia, St. Louis, Minneapolis and Denver, have issued a revised and greatly enlarged catalogue of their Ideal line of steam and hot water boilers. This catalogue is an exceptionally fine piece of work. The pages are large, enabling good sized cuts to be used. The illustrations are of the most artistic character, reflecting the latest development in the engraver's art. The type is large, thus enabling it to be easily read by everybody. In every other respect the utmost care has been taken to secure a book which will be preserved for its beauty as well as for the intrinsic value of its contents. The company, as usual in their publications, conspicuously lay down their policy. This policy avoids under any circumstances the furnishing of estimates of the cost of a heating plant for owner, architect or heating contractor, and also avoids the making of piping plans for anybody. It is the company's aim to deal only with those regularly established in the trade and with experienced, progressive and responsible heating contractors. The introductory pages further call attention to the high character of the material used in the Ideal boilers and to their scientific construction. They set forth the fact that in each of their various types of boilers every line has been laid and stands for one purpose, which is efficiency. The manufacture of these boilers is conducted on the interchangeable system, so that extra sections or parts may be ordered with a certainty that they will assemble perfectly.

The boilers illustrated comprise the Ideal Sectional 36-inch for steam and water; the Ideal Sectional 24-inch, steam and water; the Ideal 18-inch, steam and water; the Ideal 12-inch, steam and water; the Ideal Premier, steam and water; the Ideal Premier for soft coal; the Ideal Portable, steam and water; the Ideal Invincible, steam and water; the Ideal Premier Junior, water; the Ideal Junior, water; the Ideal Junior, steam, and the Ideal Sectional tank heater.

The sectional boilers are those constructed with vertical sections, which permit the installation of boilers of large capacity in low cellars. The largest parts may easily be taken through doors or windows, thus making them much more convenient to install than boilers of tubular construction. The principle of construction secures a liberal steam space above the crown sheet for the thorough disengagement of the steam. The sections employed have a large amount of everhanging heating surface in the fire pot. Perfect circulation within the boiler itself is secured. This heating surface is particularly effective when it is desired to use soft coal for fuel. Two small caps on either side of the fire door cover openings made for the purpose of introducing a coil of pipe over the fire, which offers a means for economically supplying hot water in apartment buildings or dwellings through the season when the heating apparatus is in use.

The method of connecting the sections with tapered push nipples is adopted in preference to the use of headers at top and sides. An extra large nipple is employed in the steam boilers to provide a liberal and open steam dome at the top of the boiler. These push nipples are made of cast iron of the same material as the sections, and in consequence the efficiency of the joints is in no way effected by expansion or contraction. The fire pot used in these sectional boilers is of unusual depth, considerably beyond that of boilers of similar type, giving greatly increased fuel capacity and allowing for the operation of the boiler for an extended period of time without attention.

The Ideal Premier, Portable and Invincible are boilers of circular type with horizontal sections. The Ideal

Premier has a center column connected with the sides by radial arms to secure perfect circulation within the boiler itself. This boiler is especially adapted to the use of soft coal as fuel, but the same construction is furnished with sections of special design to give best results with hard coal. The Ideal Portable boiler has a waterway at the side, through which the water rises from the fire pot and intermediate sections to the steam dome or top section in which the water line is carried.

The Ideal Invincible boilers are made from entirely new patterns. Around the fire pot and in the first section above it provision is made for the thickest water space. Liberal waterways are provided at the side through which water rises from the fire pot and intermediate sections to the steam dome. At the back of the boiler another waterway connects the dome or top section with the fire pot, passing through but having no connection with the intermediate sections. Perfect circulation is thus provided within the boiler itself, this being a feature which insures a steady water line and a constant supply of dry steam. The sections are connected with cast iron tapered push nipples. The smoke flues are staggered so that the products of combustion do not escape in a direct line to the chimney. The heated gases thus impinge upon the under side of every section. The Invincible is offered as an exceedingly economical boiler in the consumption of fuel. The Junior water boiler and tank heaters are intended for a limited amount of radiation, or for heating water for tanks or other purposes requiring large quantities of hot water.

New York City Notes

Samuel Shleman, an unlicensed plumber of 63 Mott street, was convicted last Monday in the Court of Special Sessions of doing plumbing work without a certificate of competency in the premises at 16 Pell street. Presiding Justice Hinsdale said that the court would do all in its power to break up the practice of unauthorized persons doing plumbing in tenement houses. The complainant was William Lockwood, clerk of the Master Plumbers' Association.

* * *

The Building Department is taking active measures against unregistered and unlicensed plumbers, and compelling those of the latter class to take in their signs and plumbing displays.

* * *

Reynolds & McMahon have the plumbing in a large eight-story apartment house at Park avenue and Eightieth street. William H. Quick has two high class private houses on Seventy-ninth street, east of Fifth avenue. Rossman & Bracken have a long spell of work ahead in Senator Clark's mansion at Seventy-seventh street and Fifth avenue. James Armstrong has a private house at 33-35 East Seventy-fourth street, and John Renehan has one opposite at 46 East Seventy-fourth street. J. J. Welstead is doing the store, office and studio building on Fifty-ninth street, between Fifth and Madison avenues.

* * *

Plumbers doing business in other than their own boroughs must obtain certificates of registration from their own Bureau of Buildings, which must be filed with the Bureau of Buildings in the borough where they are doing work.

* * *

The Examining Board of Plumbers is keeping up its work. fully the average number of men having applied for certificates last month.

* * *

Several changes have been made lately in the plumbing rules and regulations of Manhattan, the most notable of which condemns mechanical and interior partition traps, changes the rules governing the fresh air inlet and gives rules for flushometer closets.

* * *

There will doubtless be a boom in tenement house building now that the amendments to the tenement house law have been finally settled so that the provisions governing tenements are not prohibitory to speculative builders.

* * *

The many friends of B. F. Donohoe will be pleased to learn that he is getting over a severe attack of his old enemy—rheumatism—and hopes to be out and attending to business shortly.

Heating and Plumbing Notes.

The Plumbing and Steam Supply League team have done some fine bowling in the Business Men's Championship Tournament notwitstanding they have lost two series with their hardest competitors. On Monday night they were not to be denied and with scores of 872 and 856 they won two out of three games, Good contributing 222 and Wilson 213 in the first game, and Good 196 and Maurer 180 in the other game. The arrangements for the contest with the bowlers of the Boston supply trade are still pending. Captain Beach of the New Yorkers awaits the pleasure of Oscar Saxe, who has charge of the interests of those who bowl under the sign of the sacred codfish.

Vincent Fortune, clerk of the Board of Commissioners of Cascade County, Mont., will receive bids at Great Falls until April 21 for a heating and ventilating plant in the court house under course of construction at Great Falls.

Circulars describing the use of the patent Plumbers' Force Pump manufactured by John H. Lawless, 184 Third street, Jersey City, N. J., are being distributed to the trade, which not only show that the Pumps are used by prominent plumbers all over the United States, but also explain how profit may be derived from their possession and use.

F. N. Du Bois & Co, Twenty-fifth street and Ninth avenue, New York, have secured the Eastern agency for the Temple Vent Fittings, made by the Oliver Schlemmer Company of Cincinnati, Ohio. The house now can furnish these labor saving Fittings to the trade in Pittsburgh and Buffalo and the East, adapted for cast iron pipe, or with screw connections for wrought iron vent pipes. These Fittings are said to effect a substantial saving in time as well as in cost in erecting a plumbing system.

The Steel Clad Bath Company of New York have sold out their interests to the John Trageser Steam Copper Works of 437 West Twenty-sixth stheet, New York. This concern have been the manufacturing agents of the Steel Clad Bath Company ever since their formation, and can therefore guarantee to the trade perfect satisfaction as to quality and delivery of these well-known goods.

New Firms and Changes.

The M. J. Daly & Sons Company have been incorporated at Waterbury, Conn., with a capital of $50,000, to install heating apparatus and fire extinguisher systems, and to do a general plumbing business.

The Lowell Windmill Mfg. Company, Salina, Kan., have been recently organized. A plant will be erected at once and will be equipped for the manufacture of a patented Mill, the invention of G. S. Lowell. Later on they propose to take up the manufacture of Pumps, Tanks and Irrigation Supplies. The officers are G. S. Lowell, president; Alfred Lowell, vice-president; M. Lowell, secretary, and A. F. Wolff, treasurer.

C. T. Gordon, J. T. Gustin and C. S. Sheahan have entered into a partnership in the plumbing business at Des Moines, Iowa.

George L. Beitner has purchased the plumbing stock and fixtures of the late Theodore Fox, and will conduct a plumbing business at the old stand, 273 State street, Bridgeport, Conn.

The Oliver Schlemmer Company have been incorporated at Cincinnati, Ohio, with a capital of $25,000 to succeed Oliver Schlemmer in the manufacture of the Temple Vent Fittings, and the O. S. Distributing Fittings for hot water heating. The new corporation will have increased facilities and transact their business on a larger scale.

THE TIN HOUSE WAGE SCALE.

There is just a possibility that the plans of the American Tin Plate Company for the continuous operation of their mills this summer, based upon the agreement with the Amalgamated Association of Iron, Steel and Tin Workers, may be frustrated after all by a possible refusal of the tin house men to approve the proposition of the Tin Plate Company to continue the present wage agreement for another year from July 15. The Executive Board of the Tin Plate Workers' International Protective Association has decided to submit the matter to a referendum vote of the lodges, the result of which will probably not be known until the annual meeting of the association at New Castle, Pa., early in May. There are some indications that the tin house workers are by no means a unit on the subject of approving the Tin Plate Company's proposition, although it is considered likely that the majority of the members will realize the advisability of so doing. Meanwhile the American Tin Plate Company are approaching the season at which they will be closing their important contracts with the canning interests and other large users of tin plates during the summer. They are naturally desirous, therefore, of placing the question of the possibility of a strike of any kind beyond peradventure.

◆

Peden Iron & Steel Company.

The March number of the *Southern Industrial and Lumber Review* of Houston, Texas, contains a very interesting illustrated article of several pages on the Peden Iron & Steel Company of that city. Portraits of the members of the firm, with exterior and interior views of their warehouses, store, offices, &c., are presented, together with a detailed account of the history and business of the house. The Peden Iron & Steel Company were incorporated this year to succeed the old firm of Peden & Co. The concern have made a splendid success during their existence of less than 12 years, having built up the business from a very modest beginning to its present commanding position. The company carry a very varied and extensive line of goods, including black and galvanized sheets, tin and terne plates, metal and composition roofing and roofing materials of all kinds, tinners' and roofers' tools and supplies, metal ceilings, conductor pipe, eave trough, elbows, stoves and furnaces, pipe, valves and fittings, belting, nails, wire, hardware, tinware, tools, and many other goods of like character. They are now preparing a catalogue covering all the lines of goods carried in stock, which will be ready for distribution at an early date.

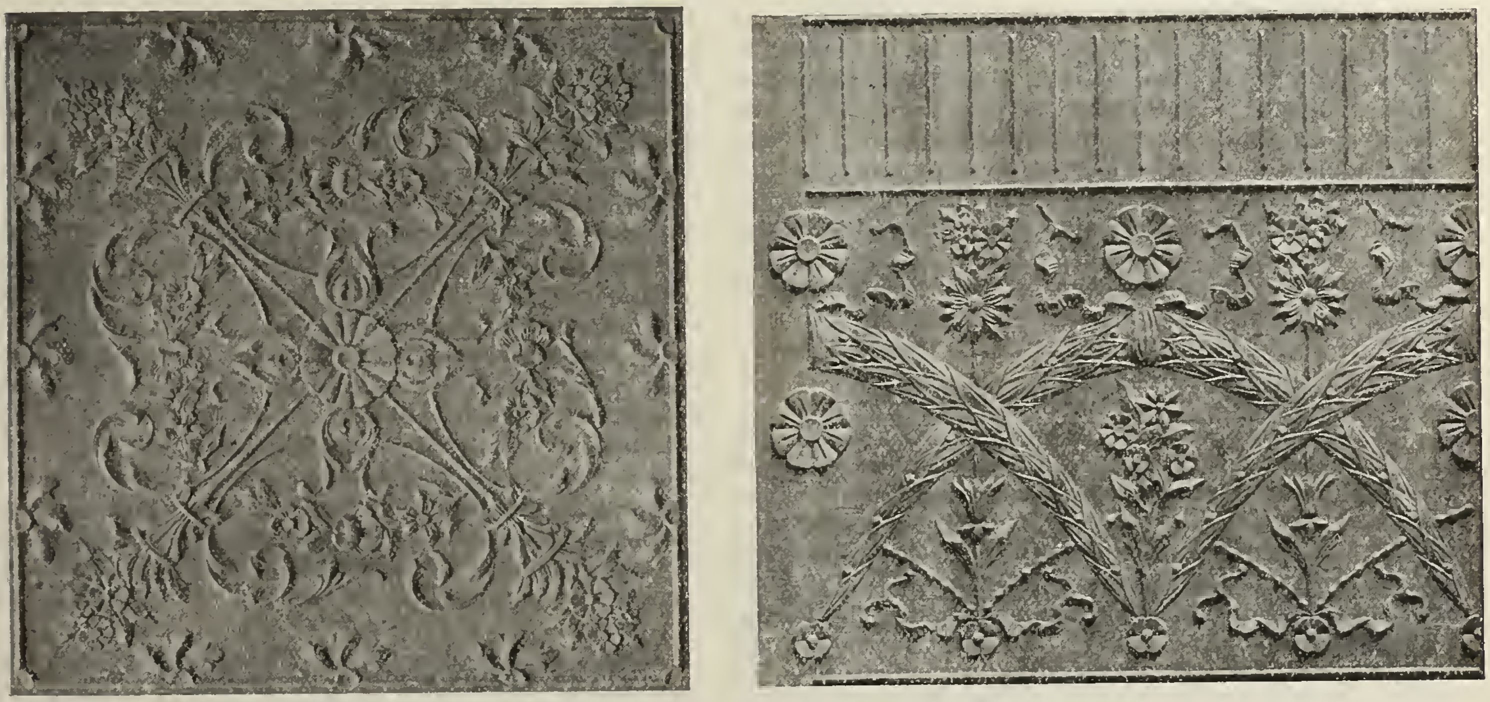
Steel Plant for Sheet Mills.

Three of the independent sheet mills, these being Laughlin Nail Company, with sheet mills at Martin's Ferry, Ohio; Whitaker Iron Company, Wheeling, W. Va., and Maryland Sheet & Steel Company, Cumberland, Md., have bought the open hearth plant formerly operated by the Burgess Steel & Iron Company, at Portsmouth, Ohio, but which was taken over by the Crucible Steel Company of America. The plant contains nine gas heating furnaces, two annealing furnaces, one pair furnace, six turns of rolls, a 4-ton hammer, four Swindell open hearth steel furnaces of 30 tons capacity each. It is the intention to overhaul the plant and add probably two more furnaces and a bar mill, and roll sheet bars. It will probably be 60 days or longer before the plant is ready for operation.

◆

Decorative Stamped Ceilings.

In the illustrations herewith are shown examples of the line of stamped steel ceilings that are being produced by the L. H. Solosth & Sons' Stamping Works, Grand Rapids, Mich. These samples represent two of the latest designs in these goods made by the concern, who also manufacture an extensive line of sheet metal ornaments and statuary.



Decorative Stamped Ceilings.

◆

Tinware and Tinsmiths' Tools in China.

In an article on the possibilities of trade with China a writer in the *British Trade Journal* has the following remarks regarding tinware and tinsmiths' tools in that country:

Cheap unglazed earthenware in a great measure takes the place of tinware in other countries. The tin that is used for small household articles is made up by hand, with the aid of a pair of shears and a soldering iron. Of course, there is a considerable amount of tin plate imported, and the thousands of kerosene tins that pass through the hands of the hawkers also find their way to the tin shops. There is no canning industry among the Chinese. All of their sauces and compotes are preserved in earthenware jars, or in old wine and beer bottles. What tools they have are very crude, and are made locally at a small price, and there are no shops that make a business of dealing specially in them.

◆

M. M. Garland, formerly president of the Amalgamated Association of Iron, Steel and Tin Workers, has been reappointed Surveyor of the port of Pittsburgh.

German Sheet Iron Syndicate.

Toward the end of last month there was formed a syndicate of the manufacturers of sheet iron in Germany, in the shape of a limited liability company, under the title Verband Deutscher Feinblechwalzwerke, composed of 46 sheet works. These include all the firms in Germany that manufacture sheets, with the exception of about three or four. These latter, however, are said to have pledged themselves not to increase their present production of sheets, and to co-operate with the syndicate, so far as prices are concerned. It will be a problem to the new syndicate to market the present enormous production of about 350,000 tons of sheets at home and abroad, the value of this output being about $12,000,000. The syndicate acts as the buyer of the product of the associated works, receiving the total output and selling the same to dealers and consumers, under the supervision of a committee of the mills. Thus direct dealings between the manufacturers and consumers will stop.

The syndicate has been arranged for a period of three years, but it may be dissolved at any time by a simple majority vote, whenever the whole sales of the outside works increase to 10 per cent. The selling agency of the syndicate will closely watch developments in the world's markets and will sell for export according to the position of the home market, so that the constituent mills may have a regular satisfactory amount of work. It is expected that the financial position of the various sheet mills will be very much improved by this consolidation. Until now they could not obtain advantageous prices for their product, owing to the sharp competition existing between them. The establishment of this powerful syndicate is regarded as one of the most important events in the history of the German iron industry.

Elbow and Skylight Patterns.

While elbows of sheet metal have been made since the establishment of the first tin shop, there is almost as much trouble in securing correct patterns for them in some tin shops as there is in securing patterns for skylight bars of different styles. G. L. Gray, 840 North Cedar street, Galesburg, Ill., is offering for sale the Perfect patterns for both elbows and skylights. The Perfect elbow patterns are on heavy blue print paper, and are in two sets. Set A is for elbows from 1 inch to 20 inches in diameter, and for 2, 3, 4 and 5 piece elbows. The sheet is 24 x 68 inches in size, and contains 80 patterns. Set B is for elbows from 20 to 40 inches in diameter, made in 5, 6, 7 and 8 pieces, including 80 patterns in all. In use, it is only necessary to lay the blue print on the tin or sheet iron and prick through on the pattern line every inch or two, after which the pattern is laid aside, and the elbow is cut on the pricked or marked line.

The Perfect skylight patterns include hip skylights, gable skylights, single pitch skylights, and chart for obtaining the length of skylight bars. They are also made on heavy blue print paper and for use are laid on the material and the pattern marked off by means of a prick punch. The suggestion is made that the best way to preserve these blue print papers from dust and from being torn is to keep them in a tin case with a tight cover, when they will last a lifetime. Mr. Gray issues circulars which can be secured on application, fully explaining the desirability and use of the different patterns he has for sale.

The American Solderless Can Company were incorporated this week at Trenton N. J., with an authorized capital of $5,000,000. It is announced that this company have secured the American rights to the use of patents covering a Sanitary Can manufactured and controlled by an English company. It is reported that the American Can Company will control this new concern and also the Packers' Sanitary Can Company, recently incorporated in New Jersey, with a capital of $500,000. Lawrence A. Norton recently resigned as auditor of the American Can Company in order to take up the work of the development of a market for the improved Can.

FLASHINGS.

M. J. Brunton & Son, Springfield, Mass., are roofing the new ice house of the Boston & Albany Railroad Company in West Springfield, and the addition to the building occupied by Meekins, Packard & Wheat. They have also the contract for roofing the West box shop. The roofing of the new building of the Hartford Foundry Company in Hartford, Conn., has just been completed by them.

The New York Metal Ceiling Company, New York City, have secured the contract for placing the Metal Ceilings and Sidings in the new Government buildings at Fort Mansfield, Watch Hill, R. I. The contract covers 20,000 feet.

The rolling mill and Steel plant of the American Rolling Mill Company at Muskegon, Mich., will shortly be placed in operation again. The company's Black Plate mills were sold some little time ago to the American Tin Plate Company, and the rest of the plant was shut down temporarily.

R. Wilson & Son, Springfield, Mass., have the contract for the metal work on the new block in course of erection for Gagnier & Angers on Seventh street, Springfield.

The Carnegie Sheet Company of Pittsburgh, Pa., have plans prepared for the erection of a six-mill Sheet plant at Carnegie, Pa. The company also contemplate the erection of an open hearth Steel plant.

It is reported that the Whitaker Iron Company, Wheeling, W. Va., are about to add two additional Sheet mills to their already extensive plant.

The Fred. J. Swaine Company, St. Louis, Mo., are exceedingly busy on orders for Presses and Dies, their facilities being taxed to the utmost to get out the work on their books. The company are constantly adding to their line, their most recent additions being a new Drop Hammer, a 60-inch Slitting Machine, a new Double Seamer, and a new No. 35 Power Press.

The Marietta Sheet Steel & Tin Plate Company, recently incorporated under the laws of West Virginia, with an authorized capital of $300,000, have purchased a tract of land at Norwood, a suburb of Marietta, Ohio, where they propose to put up a large Sheet and Tin Plate plant.

Beseman & Boswick, Hartford, Conn., have secured the contract for Skylights, &c., on a block which is being erected in New London for John Gorton. They have just completed the contract for quite a large amount of work on the High School Building on Hopkins street, Hartford.

The Monarch Iron & Steel Company of Pittsburgh, recently incorporated under the laws of the State of Delaware with a capital stock of $100,000 to erect a mill at Parkersburg, W. Va., for the production of Planished Iron Sheets, were incorporated by Thomas C. Perrine, F. M. Whippo and S. M. Mease. The company are preparing to proceed with the erection of their plant at once.

In order to accommodate their increasing business, the Rockford Can Company of Rockford, Ill., will move from their present quarters to the Spafford Building on North Madison street.

F. R. Phillips of the F. R. Phillips & Sons Company of Philadelphia, Pa., sailed last week for Europe, where he will remain for some months in the interests of the business of his company. Mr. Phillips expects to close several contracts for the installation of American labor saving machinery for steel plants and rolling mills.

The offices of Goff, Horner & Co., Limited, sales agents for the Muskingum Valley Steel Company, makers of Steel Sheets and also factors in Pig Iron and Steel, have been removed from Lewis Block to the Frick Building, Pittsburgh, Pa.

The American Tin Plate Company are building an experimental Sheet rolling plant at the Monongahela works.

Two additional open hearth steel furnaces are being built at the Vandergrift plant of the American Sheet Steel Company.

The London *Ironmonger* announces the probability of a combination of a number of British Steel, Sheet and Tin Plate manufacturers into one powerful consolidation, which is calculated to control the manufacture of Sheets and Tin Plates in Great Britain, from the iron ore to the finished product. It is said that the new company will probably be incorporated under the name of Baldwins, Limited.

The Cadwallader Tin Plate & Metal Company of Pittsburgh, Pa., have purchased from George A. Cadwallader a lot at the corner of Elizabeth and Gloster streets, Hazelwood. The lot measures 120 x 128 feet and contains a number of frame buildings. It is understood that the purchase was made to afford room for an addition which the company will make to their present plant this spring.

The General Fireproofing Company, recently organized at Youngstown, Ohio, will locate their plant on Crab Creek, in Youngstown. This concern are successors to the International Metal Lath Company, and will manufacture Herringbone Expanded Steel Products. The officers of this concern are Myron I. Arms, president; A. P. White, vice-president; George D. Wick, vice-president; W. H. Foster, secretary, and W. A. Kingsley, treasurer and general manager.

The Elaterite Roofing Company, Denver, Col., are sending out circulars relative to their Elaterite (mineral rubber) Roofing. One circular gives specifications for laying the Roofing, another describes the four grades in which it is made, while a third illustrates some of the buildings, institutions, &c., upon which it has been used. Their special grade of the Roofing is made with two layers of cloth, consisting of a canvas center and cloth top, Elaterite roofing material, mica surface and paper back.

A press dispatch from Green Castle, Ind., reports that ground has been broken for the foundation for the new Juniata Tin Plate mill, which is to be built there this summer by a company recently organized with a capital of $250,000. Sidings are to be built from the Vandalia Railroad to the mill site, and as soon as these are completed the material for six mill buildings will be rushed and their construction begun. The mill, it is said, will be one of the largest in the country, run on independent lines.

How to Increase Trade in Germany.

Charles Neuer, United States Consular Agent at Gera, submits to the State Department the following suggestions as to the best methods of increasing American trade in Germany:

Our goods, he says, would experience an enhanced sale in many lines if they could be bought directly from stock kept on hand in foreign countries. This is especially true of articles not yet well known in the world's markets or which will come from manufacturers who have transacted but a limited business abroad. The long time necessary to obtain goods from the United States is an obstacle to our trade. Sometimes it takes three months from the date of order until the goods are received. If foreigners had the opportunity to see our superior articles and to get them at a reasonable price within a few days, sales would be much more easily effected.

There is a great conservatism in trade here, and many merchants will not change their sources of supply, unless they can do so without difficulty and delay. Others confine their purchases to such quantities as are needed for immediate use. In all these cases a permanent stock in the principal centers of trade would be the best means of successfully introducing our goods. Warehouses with great varieties of articles are doing an excellent trade here. To secure the best results, concerted action and systematic effort on the part of our exporters are needed.

A press dispatch from Townsend, Del., says that John C. Haines of New York has discovered graphite on his property at Townsend. The vein is said to average 8 feet in thickness.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WHAT MAKES THE TORCH BLOW?

From Curiosity, Philadelphia, Pa.—Will some reader of *The Metal Worker* give me a remedy to stop the new nickel plated brass alcohol torch shown in Fig. 1 from constantly throwing the alcohol out through the top of the wick? The old torch shown in Fig. 2 did not do this, but the new ones do it so badly that even when the alcohol is but one-third of the distance from the bottom they throw it up and out, even with the cap on the torch. In using the torch lit with the fire on the wick the surplus alcohol flows down the outside of the new torch, taking fire there and is very apt to burn the workman who may be using it. The old flaring pattern of torch never did this, unless filled too full, but in my experience the round torch always does it. I would be glad to have some reader of *The Metal Worker* state the cause and the remedy.

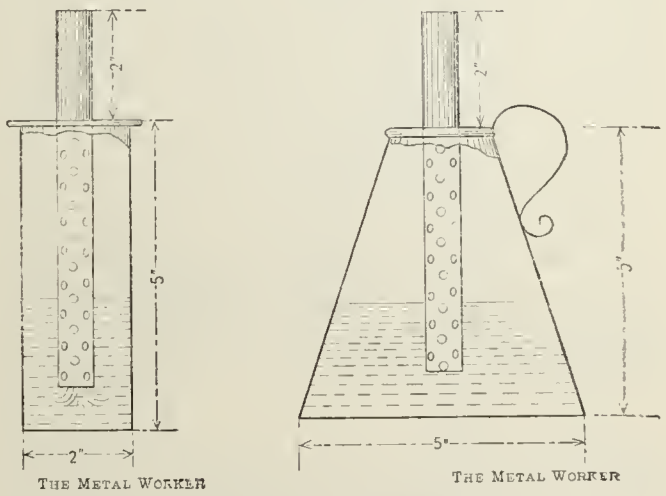


Fig. 1.—The New Torch. *Fig. 2.—The Old Torch.*

What Makes the Torch Blow?

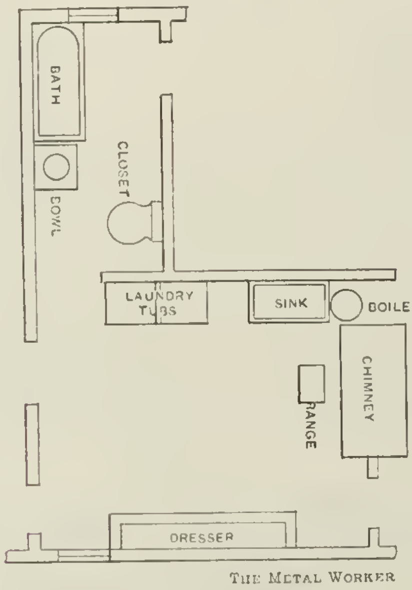
WHAT CAUSED THE FIRE?

From Thomas Hyde, Albany, N. Y.—In regard to the fire reported by "J. B. E." in *The Metal Worker* of March 22, I would say that at first thought it seemed to me that the burning mentioned could not have happened, but on second thought that it might be possible. In the first place the furnace is set with a view to heating by rotation of the air in the building, and the air to be heated is in separate compartments. I fail to see how rotation of heat can be had in any quantity above the furnace, except from the air that may squeeze through crevices in the compartment in which the furnace is located. On passing through the 2½-inch holes in the casing some of the air would creep up next to the casing and absorb practically none of the radiant heat of the furnace. It is a well-known fact that radiant heat moves very slowly through space, consequently the heat is retained in the space surrounding the furnace. I believe that had the sheet iron, which is a splendid conductor, not been placed on top of the asbestos there would have been less liability of burning. A good fresh fire will furnish plenty of heat at the base of the furnace. I would advise a cold air box to the furnace and a reduction of the space between the stove and the casing of at least 12 inches in the diameter of the casing, and I would take out the iron and asbestos and lay a course of brick.

From the Robinson Furnace Company, Chicago, Ill.—Answering the query of "J. B. E." in *The Metal Worker* of March 22, as to what caused the fire, would say that the fire, no doubt, was caused, first, by insufficient protection under the furnace, and, second, by air supply being too small. We have known of furnaces set on a layer of brick and cement on wood floors that have set fire to the floor by heating through the bricks. In our work we make a practice of cutting the basement floors out and starting the foundation on the ground beneath. If the furnace is on the main floor of the building we always aim to use hollow tile. This, we think, is the only safe method, as heat from the fire pot radiates downward to a much greater extent than might be supposed, and the brick under the furnace will get very hot, especially when a fresh fire is built.

PLUMBING A TENEMENT.

From A. O. B., Livermore Falls, Maine.—Will some of the readers of *The Metal Worker* explain their way of piping a four-tenement house, when the bathrooms are over each other, two on each side, and arranged as shown in the plan herewith? The piping must be laid under the floor and arranged to drain out independent of each other. Can they be drained into the same trap by means of a stop and waste?



Plumbing a Tenement.

ROOFING MATERIAL FOR FOUNDRIES.

From J. Callaghan & Co., Cleveland, Ohio.—We shall be glad to hear through *The Metal Worker* of the experience roofers have had with the different kinds of material for foundry roofs, particularly as to the satisfaction given and the durability of the material. We shall also be pleased to hear from the manufacturers and receive samples of the roofing material which they recommend for this class of work. We desire to learn something that can be guaranteed for at least ten years.

PUMP IS NEEDED.

From C. B., Bellaire, Ohio.—I have in my yard an artesian well 133½ feet deep. The water comes up to the top of the 6-inch curbing in the wall, but 2 feet 8 inches from the top of the pipe, which is about 10 inches higher than the ground. Can *The Metal Worker* tell me some way by which I can siphon the water out of the well? I often use siphoning for emptying tanks, barrels, &c., and have tried to siphon the water out of the well, but have failed, and would be glad to learn of some way of accomplishing what I desire.

Answer.—A siphon can only be used when the discharge end, or long leg, of the siphon is lower than the inlet end, or the short leg of the siphon. If the well were on a hillside so that a pipe could be carried down the hill some distance below the surface of the water in the well, there would be no difficulty in siphoning the water out of it. If the water is desired at a higher level than that of the well it must be lifted, which can best be done by means of a pump.

ARE PIPES AIR BOUND?

From D. F. N., New York.—In reply to the letter of "E. J. F.," in *The Metal Worker* of March 22, in my opinion, from the way he explains and shows his piping system, the falling main from the tank has become air bound at the foot. A better way to arrange a horizontal pipe under the floor or ground would be to give a slight fall to the pipe all the way down to the elbow, where it rises to the basin riser, instead of having it pitch the other way. Now when the water falls from the tank the air is trapped and held in the pocket below, until it is forced ahead of the water and escapes through the rising pipe to the basin. The discharge pipe from the tank should be located at the top. I would also suggest the placing of a pet cock on the barn rising pipe at a point where it can be opened to allow air to escape. The trouble with the telltale pipe must be where the water enters into it at the top, for if it has a slight pitch upward it would become air bound and stop its operation.

PROTECT TANK PIPES FROM FREEZING.

From J. F. K., Winooski, Vt.—In answer to the inquiry of "S. & S." in *The Metal Worker* of February 8, I would say that I have had considerable experience with tank supply pipes freezing, and am working in a much colder region than either "S. & S." or "W. J. M.," who describes his method of protecting the pipes in *The Metal Worker* of March 15. I was called upon to thaw out the tank pipe leading up a 60-foot tower to a 30,000-gallon tank at the top. The pipe leading to the fire extinguishers was 6 inches in diameter. It was cased substantially as "W. J. M." suggests, but contained a 5-inch air space, and was made of good ⅞-inch spruce, tongued and grooved and well protected by paper, and still the 6-inch pipe froze as solid as the rock of ages. If "W. J. M." will run a line of ¾-inch steam pipe inside of the water pipe, and connect a ¾-inch steam valve at a convenient point and file out a good notch in the seat, to insure against its being shut off tight, and let the steam spit over the tank, I think he will have a job that will not freeze.

WILL THE SIPHON WORK?

From A. E. O'T., Clinton. Mass.—The reply to "A. W. K." in *The Metal Worker* of March 29 corresponds with what we find to be all right in our practice. We would like to change the measurement of the well from 14 feet deep to 37 feet deep, with the water never more than 2 feet deep in the well, and inquire whether the siphon would work under those conditions?

Answer.—A siphon would not work under the conditions presented. The action of the siphon is governed by the atmospheric pressure, and whenever all pressure is removed from the long leg of the siphon the pressure of the atmosphere on the body of water in which the short leg is immersed will theoretically raise it to about 34 feet at the sea level. If the well was 37 feet deep with but 2 feet of water in it, it would be necessary to raise the water 35 feet. Under some conditions of the atmosphere and with a perfectly tight siphon tube siphonic action might occur, but it could not be depended upon under such a great lift in general use.

◆

There has been recently a revival of interest in Congress concerning the so-called Babcock bill, providing for reductions in the rates of duty upon the metal schedule of the tariff law. But at the same time a development has occurred which experienced observers believe will effectually dispose of this measure, so far at least as the present session of Congress is concerned.

The *Commercial and Financial Chronicle* has issued its final report on the gross earnings of the railroads in the United States for the calendar year 1901, the results covering 179,000 miles. The total was $1,603,911,087 in 1901, as compared with $1,454,922,185 in 1900, an increase of 10.24 per cent.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and firm.

Copper is dull and unchanged.

Pig Lead is unchanged and steady.

Spelter is quiet, but firm on scarcity of metal.

Antimony is unchanged.

Nickel is without change in price and in good demand.

Aluminum is active at unchanged prices.

Tin Plates are quiet and firm.

Sheets are still in active demand and firm in price.

Foundry Iron is scarce and prices have an upward tendency.

Sheet Copper is in good demand and firm in price.

Sheet Zinc is without change.

Hardware is moving actively and prices are firm, with upward tendency in some lines.

Scrap Iron is somewhat less active and not so firm.

Scrap Brass and Copper are lower.

Plumbers' Supplies are in good demand; prices show much firmness.

Cast Iron Soil Pipe and Fittings have been advanced 5 per cent. in price.

Enameled Bathtubs, under new list, are about at former prices.

Wire Nails are active and firm.

Cut Nails are also in good demand with unchanged prices.

Window Glass is expected to advance 5 or 10 per cent.

White Lead is firm and in good demand.

Linseed Oil is in larger demand, with prices firm and unchanged.

Spirits Turpentine has been marked down about 2c. per gallon.

METAL MARKET.

New York, April 4, 1902.

Pig Tin.—Throughout the entire week the Pig Tin market was quiet and firm. Prices remain at about the same level as those quoted last week. Trading was not very active and was confined almost exclusively to small lots for present consumption. Business in futures was quiet, and speculative trading semed to be entirely absent. Straits Pig in small lots is quoted by jobbers at 27½c. to 27¾c. per lb. The statistics for Europe and the United States, as compiled by the New York Metal Exchange, show:

	Tons.
Total visible supply March 31, 1902	18,131
Against visible supply February 28, 1902	17,043
Against visible supply March 31, 1901	18,062

Copper.—The market remains dull with little business of consequence being transacted. While quotations are unchanged, the tone of the market seemed to be a little better. The report from Boston that one of the large Copper companies had refused to sell below 14c. had absolutely no effect upon the market, and was taken to be entirely without foundation. As a matter of fact, the impression generally prevails that Copper prices will before long seek a lower level and that no increase in activity is to be looked for until that time. Retail prices are without change, Lake Ingot in small lots being quoted at about 13¼c. to 13¾c. per lb., and Casting Copper 13c. to 13¼c.

Sheet Copper.—A very fair volume of business and inquiry is noted. Buyers of Sheet Copper, however, are not placing orders for extended deliveries. The business that is now being done is mainly in the line of supplies for present and early future consumption. Prices are firm on the basis of 18c. per lb. from store.

Pig Lead.—There is no change in the position of this metal. Business is of moderate proportions and prices are steady. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report a fair volume of demand for Pig Lead with prices on a firm basis.

Spelter.—Scarcity of spot supply of the metal is the feature of this market at the present time. Business, however, is not of large volume, so the shortage of supplies has had no further effect than to stiffen prices without developing an actual advance over the figures given in our last report. Jobbers quote good Western brands in small lots at 4.60c. to 4.70c. per lb. St. Louis advices are to the effect that a considerable demand has shown itself in the market for Spelter at that point. Coming at this time, when stocks are light at the smelters, it has had the effect of advancing prices somewhat. It is said that most of the smelters are sold up well into May.

Sheet Zinc.—A moderate demand for Sheet Zinc is reported. Prices are unchanged at 6¾c. per lb. for 600-lb. cask lots, and 7c. to 7¼c. for smaller quantities.

Antimony.—This metal shows no change. Hallett's is quoted at 8⅝c. to 8¾c. per lb. in small parcels; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—As stated in another column, all the Nickel interests, other than the Société Nickel of Paris, have been combined into the International Nickel Company. Prices are unchanged, small lots being quoted at about 55c. per lb.

Aluminum.—No change has taken place in prices or in the volume of business, which continues good. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—No change has developed in this market since our last report. So far as large business is concerned, the market presented a quiet appearance. It is said, however, that all the mills are still busy turning out product to fill orders placed some time since. Before long it is expected that the can makers and some of the other large consumers will place their season's contracts. The market has a very firm appearance. The prospect of a continuance of operations at the mills by the agreement reached with the Amalgamated Association has imparted additional steadiness. Jobbers report a rather larger run of orders from small consumers during the week, owing to the advance of the spring season. Prices are without change. American Bessemer Coke Plates, IC, 14 x 20, are selling in small lots at about $4.85 to $4.95 per box at New York and corresponding points.

Sheets.—A good demand is noted for Black Sheets and a very large one for Galvanized. The mills all have a great deal of business on their books. Deliveries of Black Sheets are decidedly better, and it is said that they can now be had in from three to four weeks after placing the order. Some of the heavier gauges in Black Sheets, however, are still difficult to obtain. Prospects are extremely favorable for a continuance of a large business in Sheets during the summer and fall months, and manufacturers are doing the best they can to prepare for it. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at 3.85c. to 3.90c., and Galvanized Sheets at 70 to 70 and 2½ per cent. off the list.

Chicago advices are as follows: The demand for both Black and Galvanized Sheets seems to be increasing. Some of the independent mills are promising shipments of Black Sheets in 30 days, but they are rapidly filling their order books. The mills making Galvanized Sheets are not able to offer as early shipment. The supply of Heavy Sheets is still much below the requirements of the market. Jobbers quote small lots at 3.35c. to 3.45c. for No. 27 Black, and 70 and 5 for Galvanized.

Old Metals.—Consumers of Scrap Iron seem to be more fully supplied and the scarcity of this material is less pronounced. Consequently prices are not so strong. Demand for Scrap Brass and Copper is fair, and prices are slightly lower. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10½c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 8 c.
Light Brass	per lb. 6½c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3⅜c.
Zinc	per lb. 3 c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 16 c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.50 to 14.00
Heavy Cast Scrap, per gross ton	12.50 to 13.00
Stove Plate Scrap, per gross ton	9.50 to 10.00
Burnt Iron, per gross ton	7.50 to 8.00

THE PIG IRON MARKET.

CHICAGO.—The furnace companies in a position to do business for the remainder of this year have booked some good orders, quite a tonnage having been placed by the general foundry trade. Contracts have also been made for deliveries running into the first quarter of next year, the prices realized on these contracts being close to our maximum quotations. The demand for spot Iron is unabated, and anything in this way is taken up with avidity. Virginia No. 1 Foundry has sold up to $20.75, and Southern No. 1 to $20. We quote as follows:

Lake Superior Charcoal	$21.50 to $22.25
Local Coke Foundry, No. 1	19.00 to 19.50
Local Coke Foundry, No. 2	18.50 to 19.00
Local Coke Foundry, No. 3	18.00 to 18.50
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	20.10 to 20.35
Southern Silvery, according to Silicon	16.90 to 19.15
Southern Coke, No. 1	16.40 to 18.65
Southern Coke, No. 2	15.65 to 17.15
Southern Coke, No. 3	15.15 to 16.65
Southern Coke, No. 1 Soft	16.40 to 18.15
Southern Coke, No. 2 Soft	15.65 to 18.15

PHILADELPHIA.—The week has brought no special developments in the Pig Iron market. Sales are made at all sorts of prices and under all sorts of conditions, so that, for the time being, uniformity is out of the question. Spot No. 2 Foundry is usually held at $20, but if deliveries are spread over the entire quarter it may be had, in some instances, at $1 less. For deliveries covering July to December, $18.50 to $19 is about as well as can be done. There is an impression that supplies may be considerably larger during the latter half of the year, but the amount of work in sight is so enormous that it would be dangerous to act on this impression. For the present the range of prices would be about as follows:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$20.00 to $21.00	$19.00 to $20.00
No. 2 X Foundry	19.25 to 20.00	17.50 to 18.00
No. 2, Plain	18.75 to 19.00	17.00 to 17.50

PITTSBURGH.—The Pig Iron market continues strong. Consumers of Foundry Iron are buying heavily, and contracts have been made for deliveries running as far ahead as the first quarter of next year. We quote No. 2 Foundry at $19.50 to $20 for deliveries in the second quarter; while for delivery all through this year slightly lower prices are made.

CINCINNATI.—The Pig Iron market is in a state of suspension, so far as Southern brands are concerned. Those people who want Iron badly for immediate delivery are paying up to $2 per ton more than the $12. Birmingham basis. As to f.o.b. Cincinnati prices, those given below must be taken for just what they are worth. There is not enough spot delivery Iron in existence to make a market. What there is will sell on the basis of the maximum prices given herewith, or even higher. We quote f.o.b. Cincinnati as follows:

Southern Coke, No. 1	$18.85 to $19.60
Southern Coke, No. 2	18.60 to 19.10
Southern Coke, No. 3	18.10 to 18.60
Southern Coke, No. 4	13.75 to 15.25
Southern Coke, No. 1 Soft	15.25 to 15.75
Southern Coke, No. 2 Soft	14.75 to 16.25
Southern Coke, Gray Forge	13.75 to 15.50
Southern Coke, Mottled	13.75 to 15.50
Ohio Silvery, No. 1	19.50 to 20.00
Ohio Silvery, No. 2	19.00 to 19.50
Lake Superior Coke, No. 1	18.60 to 19.10
Lake Superior Coke, No. 2	18.35 to 18.60
Lake Superior Coke, No. 3	17.85 to 18.10

ST. LOUIS.—Owing to the continued scarcity of Pig Iron offered in this market, the recorded sales show a light amount of business. In the matter of prices, some fancy figures are said to have been paid for immediate requirements. No large transactions are to be noted at this time, and the price movement is often as high as $2 above our minimum quotations, but this is usually for small lots. We quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $17.00
Southern, No. 2 Foundry	15.25 to 16.25
Southern, No. 3 Foundry	14.75 to 15.75
Southern, No. 4 Foundry	14.25 to 15.25
No. 1 Soft	15.75 to 16.75
No. 2 Soft	15.25 to 16.25

CHICAGO REPORT.

Scrap Iron and Steel.—While the demand is fair, the supply is growing larger. Cast Scrap keeps very firm. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	13.00 to 13.50
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 8.50
Sheet Iron and Hoops	8.00 to 8.50
Plow Steel	11.50 to 12.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 7.50
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Prices of Copper and Brass are easier. The demand is good, but consumers are now getting in cheaper Ingot Copper, bought some time back, and are bidding less for Old Metal. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11⅛c.
Copper Bottoms	10⅛c.
Copper Clips	11 c.
Red Brass	11⅛c.
Yellow Brass	8¼c.
Red Brass Borings	8¾c.
Yellow Brass Borings	7¼c.
Light Brass	7 c.
Pipe Lead	3.75c.
Tea Lead	3.35c.
Zinc	3.05c.
Tin Foil	20 c.
Pewter, No. 1	16 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—The demand is still light and prices are drooping. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6⅛c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—A moderate movement is reported. The Anthracite Coal shippers have just issued their new prices, to take effect during this month. They have decided to make the same arrangement as that of last year—namely, giving a discount of 50c. per ton from the schedule price on all coal shipped in April, 40c. discount in May, 30c. in June, 20c. in July, 10c. in August and thereafter charging the full schedule. Prices are as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE BILLINGS CLAPP COMPANY of Boston, Mass., are manufacturers of the Simplicity Soldering Salts, which they especially recommend for the use of tinsmiths and canners and all who do soldering of this character. The product is offered in dry form. For use it is only necessary to mix 1 part of the powder with 3 parts of water. It is claimed that with the use of these Salts no acid or fumes are experienced. The further claim is made that the use of these Salts secures economy in the quantity of solder used. The Salts are put up in 1-pound packages.

THE HARDWARE TRADE.

Perhaps the most marked feature of the trade at present is the steadiness and strength of the market in standard lines. This is especially the case with heavy goods, in many of which the state of the raw material has recently added largely to their cost. Difficulty in obtaining the material has also contributed much to the upward tendency. In miscellaneous Shelf Hardware, in which the price of iron or steel is a matter of less importance, firmness has been given to quotations by the gradual advances which have been taking place in wages. With the continuance of prosperous conditions throughout the country the wage earners, even where there has been no concerted movement, are asking increase in wages, and in many cases the manufacturers have yielded to their demands, which have had added force from the difficulty which is experienced in getting skilled labor in many lines. The large demand on manufacturers, almost all of whom are running to their full capacity, is an influence which keeps the market firm and strong. This is a season at which the demands from the large houses naturally relax, as stock orders covering their principal requirements for the season were placed some time ago, and consequently there is only a moderate volume of new business coming in from this class of trade. Their sales, however, have been so large that many of them are finding it necessary to replenish stocks, and their supplementary orders represent a considerable volume of business. The large retail trade, whose business is valued by manufacturers, are buying liberally, as business in almost all sections is in excellent condition. The difficulty of getting goods is the cause of some inconvenience to merchants, as there are a number of lines in which a decided scarcity has developed. The first quarter of the year has ended, having made a great record, both in volume and in the general profitableness of business.

NOTES ON PRICES.

Enameled Bathtubs.—As mentioned in our last issue, the Standard Sanitary Mfg. Company of Pittsburgh, Pa., have issued a new price-list on Porcelain Enameled Bathtubs. This is known as Price-List D and supersedes all previous lists and quotations. The list was issued and took effect under date of April 1, 1902. The new quotations show a considerable reduction in the list prices on the Tubs. The reduction in the list averages about 33 1-3 per cent. It is believed by the company that in reducing their list prices a larger number of goods can be sold and used. It is believed that the previous list prices were excessive and afforded too much of a margin of profit to the plumber, who in many instances insisted on charging the full list price, which prevented the sale of this company's wares, as the lists used by other manufacturers were considerably lower on the same patterns, and in order to bring the goods within the reach of all buyers and consumers the new lists were adopted. New discounts have also been issued, which will make the goods net about the same as the previous quotations under the high lists. Another change which has been made in the list is the placing of all Tubs on the guaranteed list. Heretofore the Keystone, Leader, Crown, Ionian, Gotham, Economy and Empire Tubs were on the guaranteed list. The lists on these Tubs have been reduced to bring them to the same cost under the new discount as they were heretofore, and they are now classed and sold as guaranteed Bathtubs. The list on the Shawmut Tubs has been reduced to make the net price equal to that of the Keystone. It formerly was classed among the high priced guaranteed Tubs. The high grade and special pattern Tubs have also been reduced in the lists, and there has been a corresponding change in the discount to make them net the same as heretofore. The new list prices will be issued next week.

Cast Iron Soil Pipe and Fittings.—As a result of the meeting of the manufacturers of Cast Iron Soil Pipe and Fittings, which was held in New York City on March 27 and 28, new prices have been issued as follows:

	Discount.
2 to 6 inch Standard Pipe	50 and 5 %
2 to 6 inch Extra Heavy Pipe	60 and 7½ %
2 to 6 inch Fittings, Standard and Extra Heavy	65 and 10 %
7 to 15 inch Pipe and Fittings, Standard and Extra Heavy	50 %

It is stated that the change in the price was due entirely to the scarcity of Pig Iron and was not influenced in any way by the recent advances in the price of Iron. All of the manufacturers are covered for their entire wants, but, owing to the scarcity of the raw material, not more than two-thirds of them are running and turning out sufficient product to fill their allotment. No other change is expected for some time, unless the scarcity of Pig Iron continues.

Wire Nails.—There is little reason for complaint in regard to the trade in Wire Nails. Merchants have experienced a good deal of inconvenience on account of the difficulty in obtaining Nails as fast as the trade absorb them, and stocks in the New York Market generally are broken. The market has a decidedly firm tone. Small lots from store are quoted at $2.25 to $2.30 per keg.

Cut Nails.—The demand for Cut Nails is of such volume that the mills find difficulty in supplying at all promptly. An advance of 5 cents per keg in prices was made for April at a meeting of the manufacturers in Pittsburgh this week. The volume of business in the territory directly tributary to New York is regarded as very satisfactory. There is on the whole an increased demand for Cut Nails as compared with Wire Nails, notwithstanding the fact that there is so little difference in price. Small lots of Cut Nails from store are quoted at $2.30 per keg.

Window Glass.—A meeting of the Jobbers' Association and the combined Glass manufacturers will be held in New York on April 8, when it is expected that an advance of from 5 to 10 per cent. will be made in the price of Window Glass. The activity in building operations all over the country indicates a large demand for Glass later in the season. The Jobbers' Association quote a discount of 95 and 5 per cent. from store.

White Lead.—The demand for White Lead in Oil continues very satisfactory, and the prospects are for an extended use of painting materials of all kinds during the coming season. Quotations are firm and unchanged at 6½ to 6¾ cents per pound for retail quantities.

Linseed Oil.—The demand for Linseed Oil for immediate shipment has shown some improvement during the week. Less is heard of a possible advance in prices in the immediate future. Quotations are without change, City Raw in small lots being quoted at about 64 cents per gallon and Boiled Oil 2 cents advance on Raw.

Spirits Turpentine.—On March 31 the price of Turpentine at Savannah dropped 8 cents per gallon. Consequently, local quotations have varied greatly. The New York market, however, is now steady at about 49 to 49½ cents per gallon for small lots of Turpentine.

TRADE NOTES.

The Western Windmill & Hardware Company of Midland, Texas, have been incorporated, with a capital stock of $60,000, by T. J. Martin, George E. Cowden and E. J. Mumford.

The annual meeting of the stockholders of the Joseph Dixon Crucible Company of Jersey City, N. J., will be held on April 15. The stockholders have received notice that the last batch of an issue of bonds amounting to $500,000, which were floated when the company were reorganized, has been retired. The company are reported to have a surplus of about $1,300,000.

"How the Park Hotel Fire Could Have Been Avoided" is the title of a neat folder reproducing an article from the New York *Times* on the disastrous fire in the hotel named which is being distributed by the International Sprinkler Company of Philadelphia, New York, Providence, Charlotte, Chicago and Montreal. The article cites Edward Atkinson of Boston as the authority for the statement that the fire might easily have been checked and the grievous loss of life and property avoided if the hotel had been provided with Automatic Sprinklers. The International Sprinkler Company are controlled and managed by Clarke Merchant, president of Merchant & Co., Incorporated, of Philadelphia.

THE AMERICAN STEEL & STAMPING COMPANY of Lorain, Ohio, are reported to be negotiating with the Board of Trade of Danville, Ill., with a view to the removal of their plant to that place.

PEERLESS MFG. COMPANY, Louisville, Ky., a few weeks since took possession of their fine new plant, which is referred to as one of the largest, most modern and best equipped in the country devoted exclusively to the manufacture of Iron and Brass Fire Place Goods. Over 3 acres are under roof, thus assuring a capacity sufficient to supply the wants of the trade in the busiest season. The buildings are of brick, with roof of saw tooth construction, and every department is abundantly lighted. The entire plant is heated and ventilated by an elaborate exhaust system. Electricity is used for power, each department being operated independently. This obviates closing the entire plant in case of accident in one part, and enables the company when necessary to operate a single department extra time.

JUDD & LELAND, manufacturers of Bicycle Pumps and Sundries, a full line of Pieced Tinware, Sprayers, Cake Tins and Leather Cup Valves of all kinds, as well as Leather, Rubber, Asbestos and Special packings, have incorporated their business under the style of Judd & Leland Mfg. Company.

THE GLOBE MACHINE & STAMPING COMPANY of Cleveland, Ohio, have incorporated with $10,000 capital stock. Incorporators: W. F. Maurer, A. L. Maurer, Carl F. Schroeder, Charles Highley and J. C. Lower. They have recently moved into a new factory at 970-972 Hamilton street, and will do general machine shop and metal stamping business.

The Nickel Combination.

On Tuesday of this week the organization of the International Nickel Company was completed. The new concern are a consolidation of all the nickel interests in the world, with the exception of the Société Nickel of Paris, who are controlled by the Rothschilds. The new company have a capitalization of $9,000,000 common stock, $9,000,000 noncumulative 7 per cent. preferred stock and $10,000,000 of 5 per cent. 30-year bonds. The company have secured control of the Orford Copper Company, the Canadian Copper Company and the Anglo-American Iron Company, and the Vermilion Mining Company, who are subsidiary concerns of the Canadian Copper company; the Nickel Corporation of London, the American Nickel Company of Camden and the Société Miniere Caledonienne of New Caledonia.

The following officers and directors were elected: Chairman of the board, Robert M. Thompson, president of the Orford Copper Company; president, Ambrose Monell, assistant to the president of the Carnegie Company and metallurgist of that company; secretary, Stephen H. P. Pell; treasurer, Joseph Claudet; general counsel, Max Pam; directors, R. M. Thompson, Ambrose Monell, E. C. Converse, Max Pam, John R. De Lamar, Joseph Wharton, Millard Hunsicker, chairman of the board of the Nickel Corporation of London; Archibald W. Maconochie, and Leslie D. Ward of Newark, N. J. The Executive Committee consists of Messrs. Thompson, Monell, Converse, De Lamar and Pam.

◆

RUSSELL T. NOYES, a prominent citizen of Tilton, N. H., died on March 16, aged 77 years. Mr. Noyes was born in Deering, N. H., and moved to Tilton in 1872, where he engaged in the retail Stove and Tinware business.

New York Metal Exchange Election.

The annual election of the New York Metal Exchange was held at the Exchange Building, on Burling Slip, New York City, on Monday, March 31, when the following officers were elected:

President, Robert M. Thompson of the Orford Copper Company.

Vice-President, Adolph Lewissohn.

Treasurer, Charles S. Trench of Charles S. Trench & Co.

Board of Managers: B. Hochschild of the American Metal Company, Ltd.; H. H. Hendricks of Hendricks Bros., L. Nachmann, Julius Lobdell of J. H. Lobdell & Co., Jesse Lewissohn of the United Metals Selling Company, Wm. Jay Ives, George W. Jaques, and J. H. Lang of the National Lead Company.

Arbitration Committee: Edmund Hendricks of Hendricks Bros., S. A. Jennings of Bruce & Cook, J. Mitchell Clark of Naylor & Co., E. A. Caswell and L. Vogelstein.

Inspectors of Election: C. H. Bolles, Jr., of Merchant & Co., Incorporated; Robert Gentle and E. C. Collis.

Very little change was made in the *personnel* of the board, which is regarded as a strong one, in which copper and tin interests are most largely represented. The election of all the officers was unanimous.

THE METAL WORKER

Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

Substantially Bound in Canvas.

100 Receipts and 100 Duplicate Records, $1.00

Sent, post-paid, on receipt of price, by

DAVID WILLIAMS CO., Publishers,
232-238 WILLIAM ST. - NEW YORK.

FOR ROOFS AND IRON WORK

There is nothing quite so good as

Dixon's Silica-Graphite Paint.

It is not only the BEST preservative, but will cover two or three times more surface than any other paint.
Made in four colors—but only one grade.

JOSEPH DIXON CRUCIBLE COMPANY, - Jersey City, N. J.

RURAL FREE DELIVERY

THE ... SIGNAL MAIL BOX

BATES-HAWLEY PATENT.

A POSTOFFICE AT YOUR DOOR

THE SIGNAL MAIL BOX, Bates-Hawley Patent, IS THE ORIGINAL BOX FOR RURAL SERVICE. It has been especially recommended by the Postmaster General

It is the largest, and the only box full government size, 18 in. x 6½ in. x 11½ in., and the only one which meets all the requirements. 7½ million dollars just appropriated for extension of rural service this year. From 100 to 1,000 boxes will probably be put in in your vicinity. You should sell them. Write us for prices.

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.

We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.

The enamel coating is homogeneous, of extra thickness, and great purity.

It is *entirely free from arsenic, lead and antimony*—metals so often found in enameled goods.

Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

{ Pierre de P. Ricketts, E.M., Ph.D.
{ John H. Banks, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 5, 1897.

LALANCE & GROSJEAN MFG. CO.:

GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.

We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,

RICKETTS & BANKS,
Chemists to the N. Y. Metal Exchange.

Guaranteed Double Coated and Absolutely Pure

Copyrighted.

Read carefully the Chemists' Certificates.

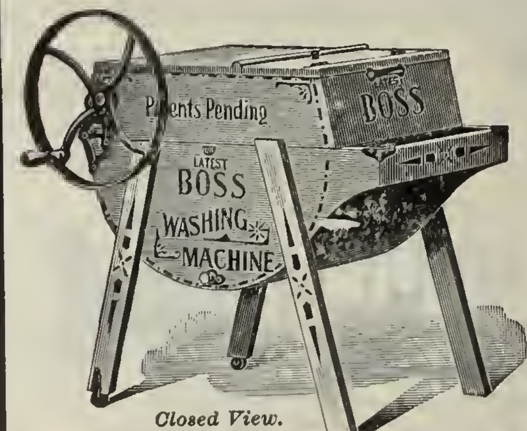
"BOSS" WASHING MACHINES.

Trade-Mark.



Closed View.

Illustration of the latest improved "BOSS" double action and rub board washing machine. Has all gearing enclosed and other important improvements.

SIZES: { 7, 8, 9, wood frame lower cylinder.
{ 10, 11, 12, steel frame lower cylinder.

We are also the patentees and manufacturers of the following:

The Boss Internal Gear Washer,
" " External " "
" New Boss Rotary "
" " Champion Rotary "
" " Standard Champion "
" Standard Perfection "
" Banner Washer and
" Improved Standard.

The washers are carried in stock in carload lots in all the principal cities. Write us and we will quote you prices and at same time advise you as to where and from whom you can obtain them from stock, thereby, perhaps, saving extra cost of freight, than when shipping from factory. These washers are carried in stock under jobbers' special brands, but none are genuine without our name and address appearing on each machine. Write for one of our beautifully illustrated and descriptive catalogues, mailed free upon application.

The White Mountain Freezer

Has gained first place among freezer buyers and is in great demand. . .

" Has gained first place among freezer buyers." Think what it means to be the favorite freezer with seventy million people ! Think of the good words half of these people can say ! Think how much easier it is to sell something every one praises.

There is probably no article sold to-day for household use that gets more free advertising than the White Mountain Freezer, and the dealer should not forget that every time he sells a White Mountain Freezer he makes an ally that tells his story free—tells it to those who will buy—and when they buy he gets the benefit.

Every leading jobber handles the White Mountain Freezer, and will quote you prices by return mail.

WRITE YOUR JOBBER TO-DAY.

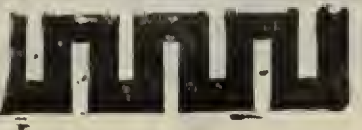
Schratwieser's Patent Sheet Metal Lath.

426-432 Third Ave., cor. 7th St., BROOKLYN



SHOWING DOVETAIL KEYS.

POLYGON

CONDUCTOR PIPE.

presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free. Address

BERGER'S "Classik" METAL CEILINGS

Bear the Closest Inspection and Examination.

LOOK AT THEM HARD; the more you look the more convinced you'll be that they are the most practical, economical, satisfying ceilings with which to decorate and improve the appearance of your rooms throughout.

They embody mechanical excellence and simplicity; special constructional features that make them easier to handle and erect—clear, bold, well defined stamping, great variety of styles to select from, together with an artistic harmony and beauty that in itself is often sufficient to give them the preference.

BERGER'S "CLASSIK" METAL CEILINGS are not only artistic, but contribute to one's safety and comfort, because they don't shrink, crack, get water soaked, or fall off. Their durability makes them the most economical ceilings in existence.

Send sketch and measurements and let us submit design and estimates.

THE PENN METAL CEILING & ROOFING CO.,
23rd and Hamilton Sts., Philadelphia, Pa. 14 Harcourt St., Boston, Mass.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING,
  2. FLARING WORK,
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the head and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

20th Century Groover

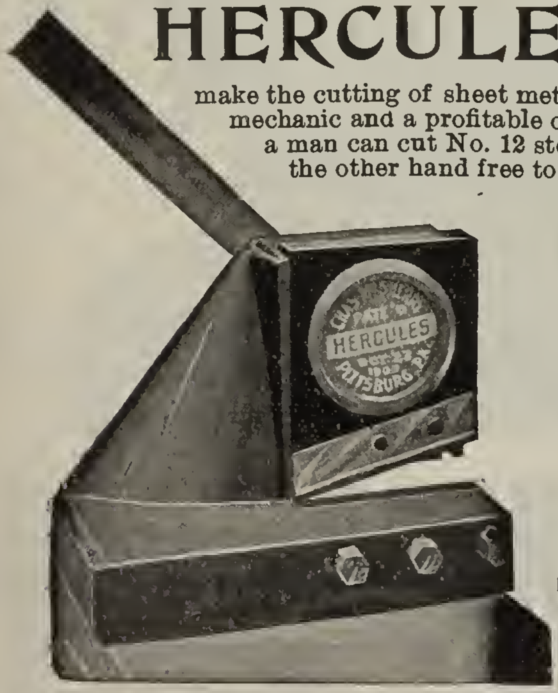
CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron.
97 inches long.

HERCULES SHEARS



make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel 1/8 inch thick, cut off and mitre angle iron 1/8 inch thick, and do it perfectly.

ROUND OAK
STANDARD OF AMERICA

It never does any harm
to reiterate a fact
and to impress it
on the minds
even of those
who already know it.

Hence—
we say again
to the stove dealer
who lives in a town
in which there is
no agency
for the sale of the
genuine Round Oak:

"Here is the best
heating stove
for any kind of fuel
made in the world;
here is a stove
that needs but
to be introduced
by the sale
of one or two stoves
to make its own way
ever after."

There is "a plenty"
of the
"just-as-good" kind
but only one
Round Oak.

Is your town open?

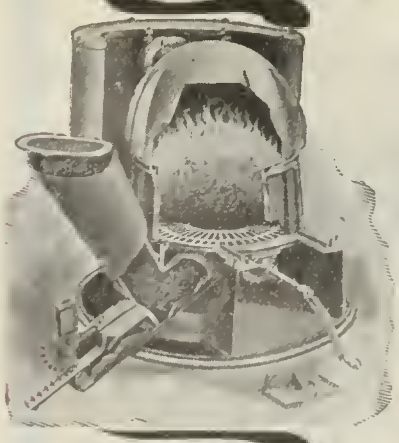
For a swell job

You ought to know our line—many a dealer loses an opportunity to make a good profit because he knows only heating stoves and furnaces.

We can post you concerning steam and hot water heating, so you can get a share of what is due you.

KEWANEE BOILER COMPANY
KEWANEE, ILLINOIS.



IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

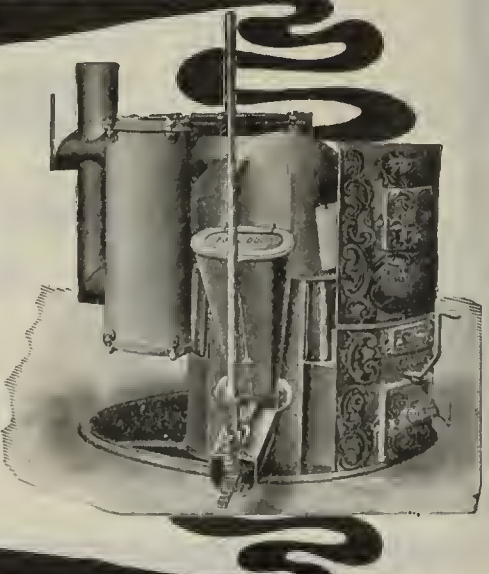
you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

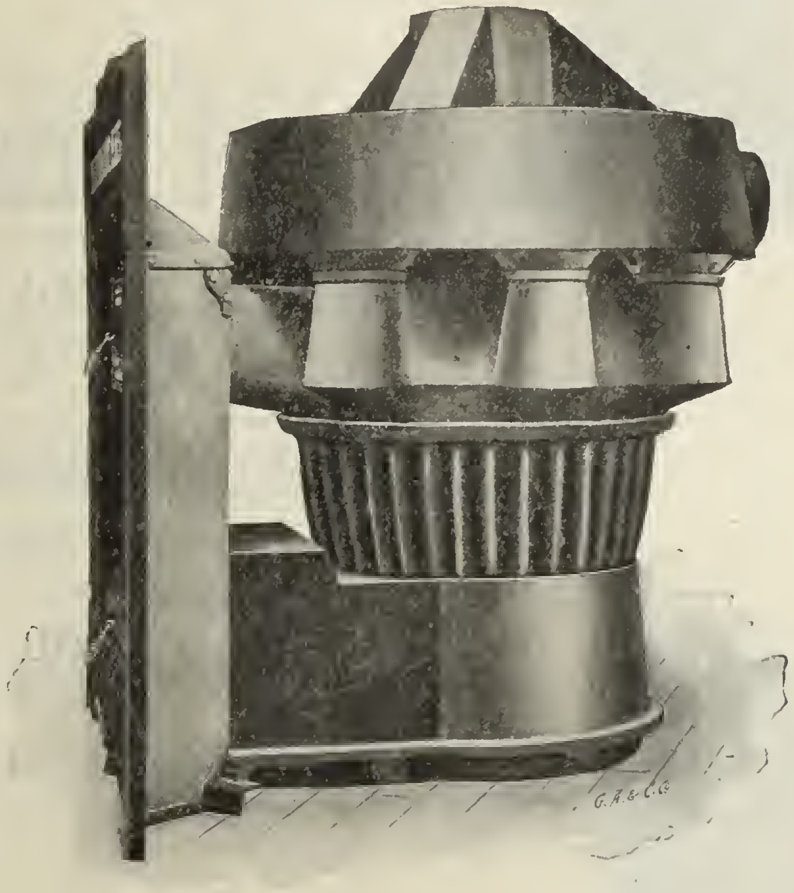
THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.



BOYNTON SCHOOL HEATER

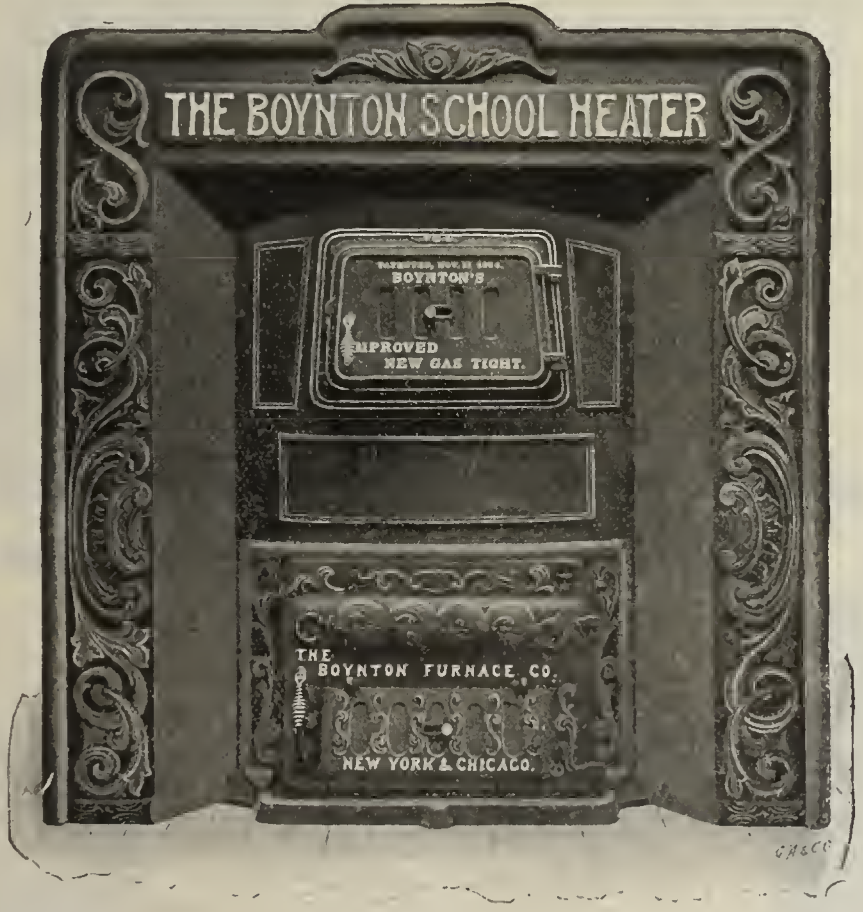
The Boynton School Heater is manufactured for and sold to the **TRADE** only.

It is more extensively used by dealers and heating contractors than any Warm Air School Heater made.



We not only stand behind the heater for its capacity to warm very large volumes of air, but we have at our command the best engineering talent in this line of work to be had; and this important requisite to success is at the service of our customers.

If there are school buildings to be erected or equipped with Heating and Ventilating plants in your vicinity, it will pay you to communicate with us **AT ONCE. DON'T WAIT.**



Of all School Heaters the Boynton is best adapted to the work: It is the largest, the heaviest, the most durable, has greatest radiating surface, is the only self-cleaning furnace, gas, smoke and dust tight, has the best grate, is no experiment, and we but repeat what the school people say of it.

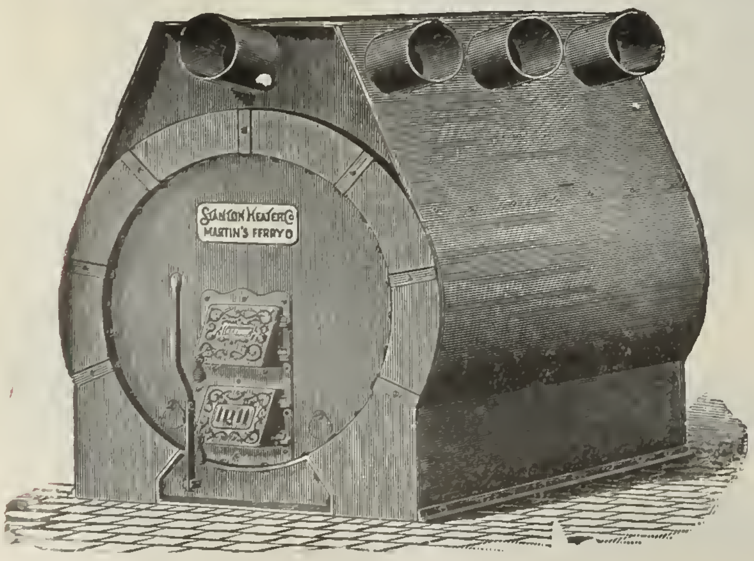
NEENAH, WIS.

The Stanton Seamless Heater,



PORTABLE CASED.

State College, Pa., June 15, 1900.

The Stanton Heater Co , Martin's Ferry, Ohio.

Gentlemen :—The Stanton Heater is giving the best kind of satisfaction. It will produce good heat from any kind of fuel. My average cost of fuel, per month, for the past winter was three tons of coal dust from soft coal to heat 43,000 cubic feet of space with a No. 68 Heater ; however, this space is 3,000 cubic feet over the capacity of your Heater, but the heater did the work easy, and held the temperature in zero weather so it would not change over four degrees in twelve hours without touching the Heater.

The Stanton Heater is, in my judgment, the most modern and economical warm-air generator of this age.

Sincerely yours, J. N. KRUMRINE.

April 2, 1902.

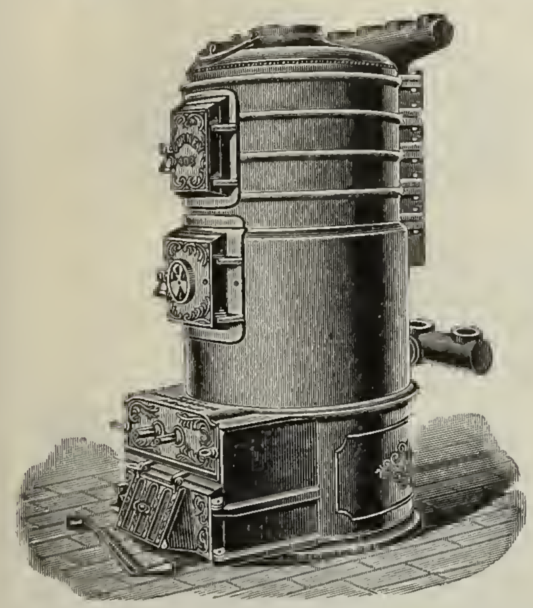
Dear Sirs:—In reply to your kind letter of the 26th ult., I beg to say that the two **"DIGHTON"** Furnaces put in by us last fall have given entire satisfaction, although the winter has been the most severe known in the State for a number of years.

With best wishes, I am,

Yours truly,

W. F. MELTON.

Never Over-Rated. . . . .



GURNEY HEATERS are never over-rated, neither in the estimation of the public nor in our claims for them. They will do exactly the work we say they will do. We declare that **GURNEY HEATERS** have no equal for efficiency, durability and economy. On account of the excellence of their construction they will maintain temperatures longer and require less fuel.

Do you not wish to handle the best? Write us for catalogues, etc.

GURNEY HEATER MFG. CO.,

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "*CONTRACT AND ESTIMATE RECORD BOOKS*" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, $1.50

500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, $2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, $0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, $1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, businesslike record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a hand book giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning,

SECOND ARTICLE

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

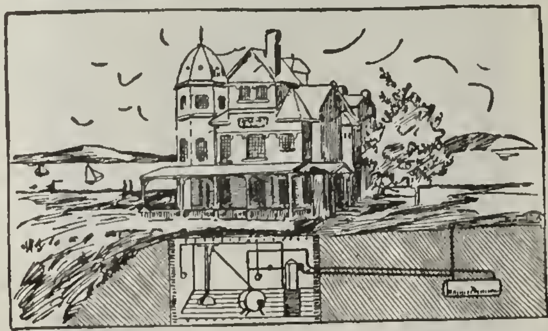
THE

Anderson Coupling Co.

PORTLAND, CONN.



Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

These include cuts of various unique designs, together with a line of 128 cuts each giving a small, accurate illustration of a salable article.

A 16-Page illustrated circular and price-list of advertising cuts will be mailed on application.

Sent prepaid by DAVID WILLIAMS COMPANY, 232-238 William Street, N. Y.

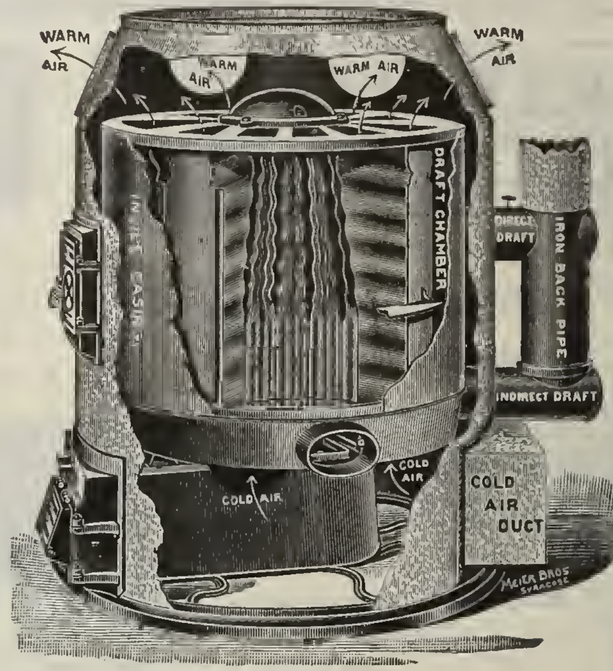
The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.



Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Ask for booklets "**KELSEY HEATING**" and "**OPINIONS.**"

Increased Pig Iron Production.

Notwithstanding that quite a number of active blast furnaces were forced to blow out for repairs last month the pig iron productive capacity on April 1 showed a marked increase over that of March 1. According to the monthly statistics of *The Iron Age*, the total weekly capacity of the active blast furnaces on the first of this month was 377,424 tons, as compared with 328,028 tons on March 1, 1902. This is by far the largest capacity on record. From the present rate of progress it would seem that the country may after a while reach a monthly average of fully 1,500,000 tons. Meanwhile, stocks have dwindled until they are now insignificant. The total of furnace stocks, sold and unsold, on April 1 was only 94,263 tons, or less than two days' production. A notable feature of the week in the pig iron market was the closing of a contract between the United States Steel Corporation and the Bessemer Furnace Association for the delivery of 200,000 tons of standard Bessemer pig iron during the fourth quarter of the current year and the first quarter of 1903. This sale pretty well cleans up the surplus iron of this character, and is taken as a strong indication that the market will not be any lower this year, but, on the contrary, may be a good deal higher. At the present moment there is practically a famine in pig iron, and it looks very much as though importations of iron will have to be made to meet the demand. A good deal of iron is still needed by some of the large consumers for the second and third quarters of the year, and it is quite a question where they will be able to get a supply. The price at which the purchase of iron by the Steel Corporation was made is regarded as very conservative, and is calculated to have a good effect on the general market. It is said to be the earnest desire of the Steel Corporation officials, and the Bessemer Furnace Association as well, to prevent a boom in the market with the inevitable reaction in prices which always follows. Meanwhile, iron of all kinds for prompt delivery is commanding very high prices, and considerably higher figures for near future deliveries have also been established. The iron market as a whole presents an appearance of great strength and firmness, with every indication of its continuance through the entire year.

Labor Agreements.

From various parts of the country come reports that building operations are being delayed through the adjustment of the wage questions which usually come up about this time. Evidently the negotiations, instead of being carried on about the first day of May, as heretofore, have been opened earlier this year. The delay in arriving at an agreement between employers and workmen at different places not only depends on the character of the demand, but also on the business conditions. Too often those making the demand have seemed to hold the opinion that it was only necessary for their employers to increase their charges to dispose of the question without inconvenience. Unfortunately, however, there is a limit to the price which the general public are willing to pay, and, although it is by no means clearly defined where this limit is approached, it has the effect of stopping business or delaying enterprises until conditions are considered more satisfactory. A proposed agreement, presented by some of the journeymen plumbers, provides that none but members of their union shall be employed by the master plumbers. In another instance the demand is made that the number of apprentices shall be reduced, while some agreements provide for the employment of men at a rate of wage 50 cents less than the union scale, provided there is always in the shop one workman receiving union wages. Beyond these stipulations the agreements contain provisions to which little exception is taken by the master plumbers, reduction of hours and increased pay for overtime and holidays being regarded as in keeping with the times. In the main, it is safe to leave the adjustment of the questions raised, without comment, to the parties interested, even though some time may be lost by the men and some disadvanage be suffered by their employers. The one all-important question, however, that both sides must consider before some of the demands can be granted is whether or not those who have work to do will consider that they can afford to pay more for having it done. This question should be well weighed wherever controversies on the wage question are now being carried on.

Fires in Tall Buildings

A recent fire in one of the tall office buildings in Chicago developed a feature which is worthy of consideration on the part of fire department officials in the larger cities. Although in the case referred to not much damage was done it was noticed that the flames went up the elevator shafts with extraordinary rapidity, considering that in this particular building there was nothing for them on which to feed. When an investigation was made it was found that the steam pipes, instead of being covered with asbestos, as the law demands, had been covered with some inflammable material. There had been one thin layer of asbestos paper, then a thick layer of felt and finally a canvas covering. When a match was put to the felt it burned like tinder. This discovery explained at once several mysteriously rapid fires in "fire proof" buildings, and a thorough investigation of pipe coverings all over the city is to be made. Possibly it would not be a bad plan to have a similar investigation made in New York and other large cities where lofty "fire proof" buildings exist.

An Interesting Test of Public Sentiment.

Municipal ownership of public utilities is a knotty problem. Few cities of any size can be found in which it is not being attempted to a limited extent. Usually the city goes no further than to control the supply and distribution of water. Occasionally the matter of furnishing gas or electric light is taken in hand. But so far as this side of the Atlantic is concerned, no attempt has been made to invade so large a field of operations as the ownership of street railway lines would involve. It has been the almost universal opinion of business men that the opportunities for political manipulation and the temptations for official corruption would be so great as to completely overbalance any benefit which the public might derive from the municipal ownership of intramural transportation systems. Other considerations also influence those who oppose municipal ownership of public utilities, not the least of which is the very great probability that improvements would not be so quickly made in methods as under private management. It is an open question whether any service rendered by a municipality could not be better done and at less cost to the taxpayer by those who would make it their special business for pecuniary profit. But very forcible arguments are presented on the other side of the question, which have great weight in creating and sustaining an aggressive sentiment in favor of the ownership of all public utilities by cities, and from time to time those who hold this view are able to exert a sufficiently strong influence to make the question one of absorbing local importance. It seldom happens, however, that the citizens of so large a city as Chicago are given the opportunity to test the sentiment of all the voters on this subject. The election held there on Tuesday of last week is consequently of decided interest.

For some years the city authorities have been at loggerheads with the corporations owning the street railways and gas plants. The opportunity has been seized by economic reformers to institute a propaganda in favor of municipal ownership. Through their efforts the voters were enabled to express their opinions on this subject on the official ballot. The count of the ballots showed that an overwhelming number of the voters are in favor of the city owning the street railways and the gas plants. This vote is not mandatory and does not mean that the city will at once proceed to take the necessary steps to secure possession of the properties of the corporations. Obstacles, financial and statutory, are in the way which cannot be overcome for a long time, and perhaps may never be. It shows, however, that if such action should be undertaken by the city authorities they would have the support of the great body of the people. The agitators in favor of municipal ownership may be relied upon to press forward from the point of vantage which they have gained and to be unremitting in their efforts to accomplish the object sought. Other cities will be deeply interested in the outcome.

Free Iced Water.

One of the most practical and valuable agencies for alleviating the condition of the poor in the crowded districts of the city is the system of free iced water fountains maintained in New York during the summer months by the Episcopal Church Temperance Society. Up to the present the society has established about a score of such fountains on Manhattan Island, and the gratifying announcement is made that their number will be materially increased this year, especially in the tenement house districts and along the river fronts where crowds of men are constantly at work at the wharves and warehouses. These beneficent institutions meet a need that exists in all our large cities, where the heat of summer often brings intense suffering to the poorer part of the community. What is being done in this direction in New York may readily be undertaken elsewhere, for the establishment and maintenance of such fountains is not a very formidable or costly undertaking. The plan followed by the Church Temperance Society is to keep coils of pipe filled with water from the city supply and cooled by being placed in a chest which is daily filled with ice. The cost of installing such a fountain is said to be about $125, while the ice is supplied from May to October at a cost of about $100 for each fountain. The fountains are usually placed directly alongside of the sidewalk and fixed in the wall of some permanent structure, such as a school, a factory or a church. Those who have passed by one of these drinking places on a hot summer day will need no further proof of the appreciation in which they are held. Usually a long waiting line is to be seen at each fountain. Since New York City harbors a tenement house population of some two million souls, for whom only about twenty iced water fountains are at present provided, it will be seen that there is room for a material extension of the system. Few causes more worthy of support present themselves to the public spirited citizen than this matter of free drinking fountains. Apart from its value in the relief of distress the free iced water fountain must appeal, too, to the temperance advocate as one of the most practical of anti-saloon agencies.

Combinations Aid Wage Earners.

State Labor Commissioner O'Donnell of Minnesota has just published a statement of the results of an inquiry on the subject of industrial combinations sent out by him some weeks ago to individual wage earners throughout the State, which is of considerable interest. From the replies received it appears that a considerable majority of the wage earners are of the opinion that combinations of capital and consolidations of industries are a benefit to wage earners. Among the reasons advanced for this belief is the statement that combinations of capital result in the establishment of extensive industrial plants, enlarging the market for labor and making it easier to get employment. Moreover, the position is taken that the consolidations of capital have invariably resulted in the organization of employees into strong unions. Thus the consolidation of capital, while reducing competition among producers, has effected a reduction of competition among laborers. The strong labor organizations are enabled to treat with the strong industrial combinations more effectively and are able to arrange schedules of wages and have them accepted without recourse to strikes, the workmen practically fixing their own wages, whenever their demands are reasonable. The labor unions also find it much easier to deal with one large corporation than with a number of competing manufacturers.

The catalogue issued by the Thomas S. Clarkson Memorial School of Technology, Potsdam, N. Y., includes in its announcements for 1902 and 1903 an outline of the course of mechanical engineering, which includes, among its subjects, heating and ventilation, steam and refrigeration and the construction of the various types of steam boilers. Courses are also given in chemistry, civil engineering, drawing and design, engineering, economics, electrical engineering, home science, hygiene, mathematics, mechanics, physics, physiology and shop work. The shop work includes wood turning, pattern making, forging, foundry work, bench iron work and machine tool work.

THE NATIONAL ASSOCIATION OF STOVE MANUFACTURERS.

Secretary Thomas J. Hogan has issued, under date of April 3, the following announcement relative to the approaching convention of the stove manufacturers:

To the Stove Manufacturers of the United States:

The thirty-first annual convention of the National Association of Stove Manufacturers will be held at the Waldorf-Astoria, New York City, on Wednesday, May 14, 1902.

I am instructed by the president, Albert N. Parlin, to extend an invitation to every stove manufacturer, whether a member or not of the association, to attend this meeting and take part in all the proceedings, except in voting.

Topics of interest to the entire stove fraternity will be discussed, and every effort is being put forth by the executive officers to make this meeting interesting, instructive and profitable to all who may attend. You are therefore cordially urged to set aside your business care for a few days and meet with your brother manufacturers and discuss with them the ways and means that will best serve to advance the interests of the stove industry. The advantages of gatherings of this kind are significant to the small even more than to the large houses, and no equal expenditure of time and money can reasoably yield as large returns as participation at gatherings of, and informal intercourse with, gentlemen engaged in the same line of business. All who come may rely upon the sincerest welcome from the members of the N. A. S. M.

Nonmembers will be entitled to all the privileges of reduced rates for transportation and special hotel rates, same as members of the association.

Representatives who are not members of firms or officers of corporations should produce credentials from their principals addressed to the secretary of the association.

Transportation.—Reduced rates, amounting to a fare and one-third for the round trip, have been conceded by the Trunk Line Association, the Central Passenger Association, the Southern Association and the New England Passenger Association from points in their territory, upon the condition that at least 100 persons having certificates attend the meeting. Certificates should be obtained from the agent of whom the tickets are bought, and if the starting point is outside of the territory where certificates are issued a short trip ticket to the nearest point in that territory should be secured and a ticket to destination be bought from that point. Certificates should be signed by the agent of whom the tickets are purchased, and they must be signed at the meeting by the secretary and vised by the special agent who will be present for that purpose, in order to secure the rebate on the return trip. In starting full fare must be paid, and the return trip will be made one-third fare upon presentation of the certificate properly vised.

Hotel Accommodations.—The Waldorf-Astoria is conducted on the European plan entirely.

Single rooms, without bath, range from $3 per day and upward.

Double rooms, without bath, accommodating two people, are from $5 upward.

Single rooms, with bath, $4 per day and upward.

Double rooms, with bath, $6 per day and upward.

There are a number of hotels in the vicinity at which accommodations can be had at cheaper rates if desired.

It is important and necessary, if you wish to be properly cared for, that you notify the hotel proprietors a little ahead of time to reserve for you such accommodations as you require, and state whether you desire a room with or without bath, and about what price.

STOVE FOUNDERS' NATIONAL DEFENSE ASSOCIATION.

The following announcement relative to the seventeenth annual meeting of the Stove Founders' National Defense Association has been issued from the office of the secretary, Thomas J. Hogan:

The seventeenth annual meeting of the Stove Founders' National Defense Association will be held at the Waldorf-Astoria, New York City, on Tuesday, May 13. The proceedings will commence promptly at 10.30 a.m. Your attention is called to the fact that the meeting of this association is held one day prior to the meeting of the National Association of Stove Manufacturers. President Castle urges the attendance of every member at this meeting, as matters of special importance will be considered and acted upon. Kindly advise me of your intention to be present.

THE WESTERN ASSOCIATION OF STOVE MANUFACTURERS.

The annual meeting of the Western Association of Stove Manufacturers was held in Chicago on Tuesday. After discussing the various conditions which tend to increase the cost of the production of stoves, a resolution was adopted making a 5 per cent. advance in the price of all oast iron stoves and ranges, except the highest grade base burners, to go into effect immediately. This makes a total advance of 10 per cent. on cast iron goods this year. No change was made in the price of steel ranges, as they had already been advanced 10 per cent. It is expected that stove manufacturers in other sections will follow the example thus set by the Western Association of Stove Manufacturers.

This meeting being the annual one, the following officers were elected for the ensuing year:

President, Dr. W. G. Henry, Detroit Stove Works, Chicago.

Vice-President, D. McAfee, Thomas White Stove Works, Quincy.

Treasurer, Louis Moore, Joliet Stove Works, Joliet.

Secretary, Thomas J. Hogan, Chicago.

STOVE MARKET FIRMER.

There has been what may be considered fairly good buying on the part of the stove trade so far this year, particularly outside of the larger cities, and while there are indications of a slight falling off this month, many houses are well satisfied with the trade that is coming to them. In some sections the prices ruling through last year were withdrawn the early part of this year and there has been a general stiffening of prices. In the vicinity of New York the stiffening has not been so marked as in some other districts. A change, however, seems to have been developed recently and independent advances in various lines have been made by different houses selling in this market. Apparently stove dealers have not been unprepared for this and have raised no substantial objections to it. At the present time, as the price of iron shows great strength and the wages of stove molders have been advanced 5 per cent., there is every reason to expect that those who buy stoves will have to pay increased prices. Should there be as much difficulty in securing iron and fuel in the fall as has been met with during the spring, it would seem that some shortage may be developed in the supply of stoves and the dealer may experience trouble in having his wants supplied. If on investigation stove buyers should conclude there was a basis for such an opinion, it is probable that the stove salesmen will have less difficulty in getting orders than they have had for many previous seasons.

The New Process Gas Ranges.

The Standard Lighting Company of Cleveland, Ohio, are issuing a 48-page catalogue entitled, "How, When and What to Cook; or, Cooking Made Easy by Using Gas." The publication is issued in the interests of the New Process gas ranges, made by the company, and the recipes which it contains have been gleaned from the latest and best authorities, according to Mrs. Alice Carey Waterman, a well-known authority on culinary topics. The recipes are said to meet a crying need of the hour for plain, wholesome, palatable foods, with full instructions for the preparation of foods that nourish and meet the demands of the body, without extravagant expenditure of money, material, time or patience. After giving some instructions for the selection of a gas stove and for its use, interspersed with the text are found a variety of recipes for everything adapted for the summer bill of fare, from soup and fish to pastry and pudding. Half-tone engravings show many everyday dishes attractively arranged. One illustration shows a table set with an informal luncheon, suitable for "when a friend drops in."

The Furnace Work Record.

SUGGESTIONS FOR IMPROVEMENT.

We have received many expressions of opinion in reference to the Furnace Work Record recently presented in *The Metal Worker*, with not a few suggestions for its improvement, and are glad to note the interest taken in it. This interest has drifted in two directions—the one scientific and the other financial, but both involving mathematical calculations—as may readily be discerned from the suggestions for improvement which we take pleasure in presenting below for the benefit of those who may desire to devise some system of recording their work, with a view to avoiding loss of profit, as well as the failure of the plants they install to operate satisfactorily.

For half a century the attention of those engaged in the furnace trade has been devoted principally to its financial side, without any such general desire for a uniform specification and contract as has been discussed by the heating contractors in the steam and hot water field. There can be no question that an all-important factor in any furnace heating plant is the profit which it brings to the furnaceman, and methods to avoid loss are consequently of great importance. On the other hand, the greatest loss, not only to individual furnacemen, but to the whole furnace trade, has come from furnace work that has proved unsatisfactory in use. It is the opinion of many who have the best interests of the furnace trade at heart that most failures of furnaces to heat buildings are due to the thumb rule and guess work methods which largely prevail except where men have had opportunity to acquire experience. This want of method has not only been the cause of financial loss to the whole furnace trade, but has also prevented furnace heating from rising to its proper place in the estimation of the public.

Men who seek to advance furnace heating are strongly of the opinion that if furnacemen would co-operate in the collection and recording of information for the formulation of rules which would enable all to do successful work one of the greatest obstacles to the more general use of furnace heating would be removed. The opinions of such men have been presented in previous issues of *The Metal Worker*. We now give some of the suggestions that have been received for the improvement of the Record.

A Pacific Coast furnaceman, who returned the Record of Furnace Work filled out with examples from his practice, remarks:

I think these blanks are an excellent thing for people who do a large amount of house heating work, and can think of no changes to suggest, other than a column showing the total number of heat units required for the house, which I always compute for my furnace work.

A member of a heating concern in Massachusetts says:

We are keeping a record of one of our jobs, which we will send to you in a few weeks. In the meantime we would make a few suggestions in regard to the Record of Furnace Work. It should give:

- The location of the building as to the points of the compass.
- The number of hot air pipes to the first, second and third floors.
- The size of vertical stacks, and the size of the cellar pipes to the stacks.
- The size of ventilating pipes from the different rooms and their area.
- The size and area of both heating and ventilating registers.

A Western furnaceman suggests that the Record should include:

- The coal burned during a week.
- Whether the windows are single or double glazed.
- The number and size of wall stacks.
- Temperature at registers on different floors.
- Temperature usually maintained in rooms.
- Exposure of building as regards points of compass.
- Depth of the cellar.
- Average pitch of hot air pipes.
- Points of compass from which cold air is taken.

A New Hampshire man expresses the desire to keep the blank, but says that he will fill in a duplicate if furnished to him. He suggests seven more columns to be added to the Record, as follows:

- Estimated cost of registers.
- Estimated cost of pipes, dampers, &c.
- Estimated cost of heater.
- Estimated cost of labor.
- Estimated cost of incidentals.
- Prices submitted to customer.
- Actual cost completed.

An Iowa furnace contractor writes:

I give here a little idea of what I think should be used in connection with *The Metal Worker* Record of Furnace Work. I would either make a chart large enough to add these items, or make a separate chart to include them. It will be seen that I carry out the cost of everything, which, when referred to, will give the exact cost of the job complete. Then when the Record is filed away for reference it is very easy to learn just what was used and what it cost. In case it is necessary to make a rough estimate of another job in a short time it will be found of great assistance, for one of the Records can be referred to which may cover a building very similar to that which you are called upon to estimate. When a customer asks what a job will cost and wants an estimate, ask him about the size of the house, so as to form an idea of the size of the furnace that should be used. Then find the cost of the furnace and multiply it by 25 and point off three decimals from the left. This will give the price very near what the job will cost, if you were to figure each item out separately and add your profits, as will be shown by an examination of the list given below. In this instance the furnace cost $93.64, which, multiplied by 25 and the decimal point placed, gives $233.10.

Building heated	Name of owner.
Wall surface	3060 square feet.
Glass surface	420 square feet.
Type of furnace	No. 44, steel.
Capacity	22,000 cubic feet.
Cost of furnace	$93.64
Size of hot air pipes	1-8, 1-9, 4-10, 2-16 and 2-12
Area of pipes	940 square inches.
Cost of pipes and fixtures	$38.46
Size of cold air duct	24 x 28 inches.
Cost	$10.00
Proportion of hot air piping to wall surface	1 square inch to 3 square feet.
Temperature at register	150 degrees.
Temperature outside	Zero.
Registers	8
Register faces	2
Cost of registers	$48.72
Cost of labor on furnace	$14.00
Cost of job complete	$204.82
Per cent. profit	$34.33
Total	$239.15

A Philadelphia furnaceman writes:

My candid opinion of the record of furnace work is that there is too much blank to get the average furnaceman to fill it out. The number and size of the windows, it seems to me, might be omitted from the sheet, as the column "glass surface" covers the point. The proportion of hot air pipe area to space heated appears to me to be of little value when averaged for the entire house. The relation between the area of these pipes and the contents of the room to which it is connected and the equivalent glass surface in the room is of importance, noting, in addition, the floor on which the room is located. It seems hardly necessary to compute the proportion of heating surface to space heated and the equivalent glass surface, since, if the ratio of heating surface to grate surface is what it should be, these proportions may be whatever they are, and the house will be heated successfully if the proper grate surface is provided. I believe the blank, when boiled down, will be productive of much good to the entire furnace trade, and should the data compiled be returned to *The Metal Worker* for presentation information of vital interest will be recorded and preserved. I believe it to be to the interest of the whole trade to aid in getting this branch of the heating business figured on a more systematic basis, as there is no reason why furnace work should not be calculated with as much certainty as steam and hot water heating.

THE BRYAN HEATER COMPANY, Hoosick Falls, N. Y., are making extensive improvements at their plant, which will give them increased producing facilities. A new two-story building, 50 x 75 feet, has been erected, which will be used for storehouse purposes, and the warehouse has been equipped with an overhead trolley for convenience in handling the company's Hot Air Furnaces.

ROTARY SYSTEMS AND FURNACE CONSTRUCTION.

BY E. W.

Feeling greatly interested in the discussion of the merits, &c., of hot air furnaces which has been going on in *The Metal Worker* within the past few months, I venture a few words in regard to the healthfulness of air warmed by hot air furnaces, and also in regard to the method of obtaining the best results.

I cannot agree fully with "Iowa" in his views presented in *The Metal Worker* of March 8 in regard to the rotary system of furnishing air for warming. If the house to be warmed by a hot air furnace has a large hall it would be well to draw air from the floor to the furnace. However, my opinion is that air warmed and conducted to rooms by the rotary system is as good, and better in a general way than air warmed over and over again by contact with radiators which are placed in rooms for heating them by either steam or hot water. I think that with either of the latter two systems the air warmed cannot be as good for respiration as air taken from out of doors and warmed by passing over the heated surface of a furnace, provided the furnace is properly constructed and proper attention is given to ventilation.

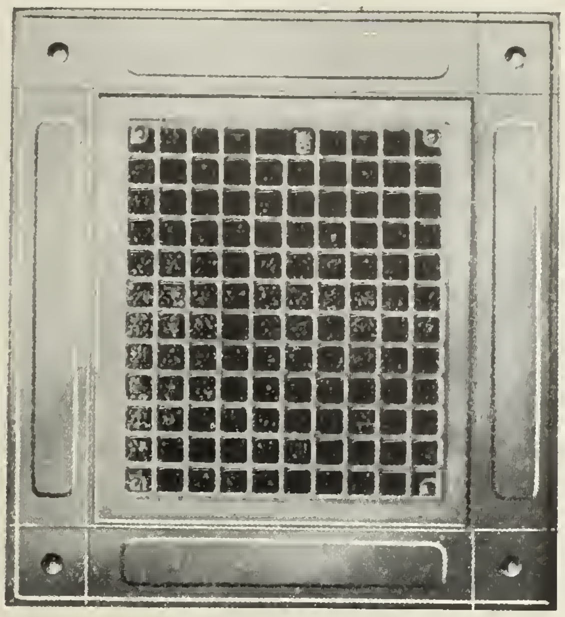
I have been engaged practically in the hot air furnace business for 52 years, and during that time have been an interested observer of the operation of many and of a great variety of furnaces. I believe that great injury has been done to furnace heating by the production of the various cheap kinds of furnaces which are sold. The sharp competition for trade has been injurious to all interested in the reputation and success of furnace heating. I am glad to learn from *The Metal Worker* that the hot air furnace is reviving and gaining favor. This is a good time for furnace manufacturers to revise and improve their productions and to so arrange them that they will be capable of warming rooms at a greater distance from the furnace. There is abundant room for improvement in the construction of the hot air furnace, which can and will be accomplished, not so as to compete with the very low priced furnace, but so as to make them much more satisfactory to the user.

The Chappell Furnace Catalogue.

The New Century catalogue devoted to the Chappell hot air furnace, manufactured by the Chappell Furnace Company of Morenci, Mich., which consists of 18 pages, shows a furnace adapted for the use of either coal or wood, arranged so that the fire chamber and combustion chamber present a large amount of surface, while the products of combustion on rising pass into a large cast iron seamless radiator, from which they pass to the chimney, or, by turning a damper, take a still longer travel to the smoke outlet. By this means not only is an economy of fuel effected, but a large heating surface is presented. The Chappell furnace is designed for brick setting and is made in several styles, one style being constructed entirely of sheet steel. The last pages of the catalogue contain some useful information for the guidance of furnacemen in setting up furnaces and in determining the size of furnaces to be used from detailed information as to the character of the building.

The H. & C. Wrought Steel Registers.

We present herewith illustrations showing the appearance and construction of the new H. & C. wrought steel hot air registers, that are being manufactured by the Hart & Cooley Company of New Britain, Conn. Among the special points to which attention is drawn by the manufacturers of these goods are that the registers are practically unbreakable, and that, while much stronger than cast iron, they average over 40 per cent. lighter in weight, making a considerable saving in freight charges. The register boxes, being of shallow depth, require much less room than others in use. In most cases the register will take the place of the convex face registers for side wall use. The border frames are provided with lugs at each corner, as shown in Fig. 1, for centering in the floors, and these lugs may be readily hammered flat if desired, thus obviating carrying in stock borders both with and without ribs. Tin box loop holes are provided in the borders in the same location in each size as in the standard makes of cast iron registers. The register boxes are also equipped with tin box loop holes for use in fastening to side walls, for which purpose a flange is provided on the boxes. The registers may also be fastened to side walls by screws through these flanges, thus preventing the necessity of marring the surfaces of the face plates with screws for holding the same. The registers and border frames are of standard size, and interchangeable with the standard makes of cast iron registers. Face plates of wrought brass are furnished at a very moderate advance over steel, making a register that will retain its finish and always present a handsome appearance. The manufacturers point out that the unique brass finish makes an especially attractive register. Register faces are finished to match standard finishes of hardware, as well as of the standard register finishes. Each register is packed in a cardboard box, making a neat package, and these are packed in cases of a convenient size for handling.



The H. & C. Wrought Steel Registers.—Fig. 1.—General View.

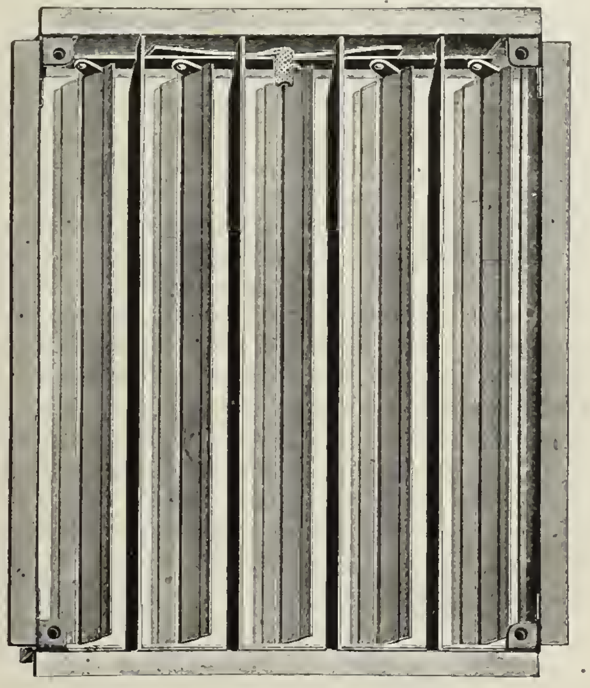


Fig. 2.—The Valves.

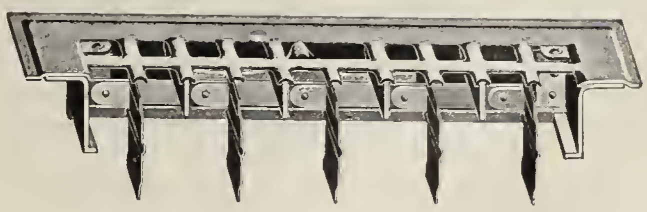

Fig. 3.—Sectional View of Face and Valves.

Uriah Hill.

The Union Stove Works of Peekskill and New York City are in one respect, at least, unique, and probably lead all competitors in the stove business, in having a president who has just celebrated the sixtieth anniversary of his wedding. The friends of Uriah Hill, Jr., will be interested to know that this event, so unusual, occurred on Thursday last. Mr. and Mrs. Hill were the recipients from their relatives, who assembled at the family residence in Peekskill, of several handsome tokens in remembrance of the happy occasion, while the company's clerks in New York conveyed their congratulations and presented to them a Tiffany vase of cut glass and sterling silver. Mr. Hill remains in the enjoyment of good health, and comes to the New York store weekly for business consultations with Mr. Acker, the treasurer, and his other colleagues, who, with all his friends, sincerely wish him many happy returns of his wedding anniversary.

ODD PLATES.

The Reading Stove Works, Reading, Pa., have recently made shipments to Australia, South America, Turkey, Holland and South Africa.

The Sun Stove Company, Detroit, Mich., have filed amended articles of association, increasing their capital stock from $40.000 to $100,000.

W. J. Carton of Utica, N. Y., died on April 3, at Colorado Springs, Col., from the result of a carriage accident. Mr. Carton was vice-president and treasurer of the Carton Furnace Company until about five years ago, when that concern were merged into the International Heater Company. Some years ago he was attacked by a spinal trouble, which permanently crippled him, since when he has spent considerable time in the West for the benefit of his health. Mr. Carton was 42 years of age at the time of his death and was never married.

The spring renovation of their quarters is well under way at the office and showrooms of the Thatcher Furnace Company, 240 Water street, New York. The entire second floor is now being provided with a handsome metal ceiling appropriately decorated, with a view to increasing the light and giving better facilities for the office force and salesmen. The walls and ceilings of the showroom on the first floor are also being refreshed, to set forth to better advantage the Thatcher line of Hot Air Furnaces, Steam and Hot Water Boilers and Ranges.

The Malleable Iron Range Company, Beaver Dam, Wis., have decided to erect larger buildings and otherwise increase the capacity of their plant.

George W. Wagoner of Floyd, Wells & Co., Royersford, Pa., who was a visitor at their New York office, 210 Water street, this week, expressed his satisfaction at the fine showing of Irving, Starling and Home Ranges that is being made by Manager R. W. Hillman. The firm recently shipped two carloads of Irving Ranges to San Francisco.

In a recent report on the outlook for American export trade with Germany United States Consul-General Frank H. Mason of Berlin says in regard to Stoves: "American anthracite has been experimentally imported to Berlin during the past winter, but has failed of its expected success because it is harder than the Welsh coal, makes more ash but less clinkers, is less inflammable, and being, therefore, harder to kindle and more liable to extinction under reduced air supply, has not worked well in Stoves and Furnaces made for British anthracite. There would seem, therefore, to be an opportunity for a limited number of Stoves adapted to the American fuel."

The Rochester Radiator Company, Rochester, N. Y., who are well known to the trade through their Rochester Radiator for utilizing the heat from smoke pipes, also manufacture a variety of Registers and other Stove Dealers' Supplies and Fittings.

Chalmers Trimble has been elected secretary of the Stanton Heater Company, Martin's Ferry, Ohio. Mr. Trimble was formerly a Government gauger at Powhattan, Va.

The Detroit *Journal*, in calling attention to the fact that the National Association of Manufacturers must choose a new president at its meeting in Indianapolis, April 15, states that it could do no better than to consider the name of George H. Barbour of Detroit for that position. Doubtless this view will be indorsed by his many friends in the Stove trade.

The Eastern Stove & Range Company, with principal office at 130 Fremont street, San Francisco, Cal., have been incorporated with a capital of $50,000 to conduct a general Stove business. They will do an exclusively wholesale business, calling on dealers in Stoves, Hardware and Metals on the Pacific Coast and the Orient. The company desire to receive catalogues, descriptive matter and quotations on goods pertaining to their lines. They have purchased the wholesale department of the Phinney Stove & Hardware Company of San Francisco.

The Weir Stove Company, Taunton, Mass., are building a new core room as an addition to their plant.

The Standard Blue Flame Oil Gas Company of Chicago were incorporated last week in Delaware, with a capital of $500,000, to manufacture Steel Heating and Cooking Stoves, &c.

The Richmond Stove Company, Norwich, Conn., are building a two-story addition, 68 x 103 feet, to their foundry and propose enlarging the Collins water wheel works, which they own, by erecting a building, 100 x 200 feet, for storage purposes.

Care of Aluminum Utensils.

Leaving out of the account the question of expense, aluminum cooking utensils probably have failed to secure the place in popular favor that they deserve, owing to the ignorance of the public in regard to their proper care and preservation. In order to overcome this difficulty the Aluminum Cooking Utensil Company of Pittsburgh, Pa., have issued a little pamphlet containing full information in regard to aluminum kitchen ware, in which the following directions are given for the proper treatment of these goods:

Aluminum is not superior to the human body, in that it must be cleaned to be kept in order. The statement is often made that aluminum does not tarnish. This is not strictly true. It tarnishes, however, much less than do the other metals with which it is commonly compared. If an aluminum utensil is set away where it is not kept clean and dry it may in time darken, and this darkening is largely due to the accumulation of dirt, &c., and to some extent also to chemical action upon the metal itself—a true tarnish. If, however, the same utensil is occasionally washed and rubbed there should never be any perceptible discoloration. The first important step, therefore, in the case of aluminum utensils is to keep them clean and dry when not in use. Wash each utensil well in hot water and plenty of soapsuds, dry with a cloth and place empty upon the hot stove for a few minutes. The object is to dry quickly and thoroughly. Ordinarily such care will be sufficient to keep the utensil in perfect order.

There are a few things which are enemies of aluminum and must never be used in cleaning it. Never boil ashes, lye or other alkalies, such as soda, potash, ammonia, &c., in an aluminum utensil. These substances attack the metal and blacken it, and water containing any of them will affect the utensils in a similar manner. Water containing sewage or other contamination will discolor an aluminum utensil. This is largely due to the presence of ammonia. Should the utensils become discolored the fault lies not with the utensil, but with the water used. It should be looked upon as a valuable indication of the condition of the water and should teach the necessity of a good filter or other means of purification. The discoloration may be prevented by using water which has been previously well boiled. This should always be tried when there is any trouble.

For cleaning aluminum utensils wash with soapsuds and hot water, rinse and dry as already described. Should anything adhere instantly pour hot water into the utensil and let it stand to cool. Should it be necessary, scour the inside with bath brick dust or Sapolio. Use any good silver polish for the outside.

CONSOLIDATION OF HARDWARE JOBBERS.

Authoritative announcement is made by *The Iron Age* of the consolidation of the great jobbing hardware interests of the country, rumors of which have been current for some time past. The consolidation embraces the Simmons Hardware Company of St. Louis, the Bindley Hardware Company of Pittsburgh, the William Bingham Company of Cleveland, the Supplee Hardware Company of Philadelphia, the Pacific Hardware & Steel Company of San Francisco, the Marshall-Wells Hardware Company of Duluth, the Bigelow & Dowse Company of Boston, the Van Camp Hardware & Iron Company of Indianapolis, the George Tritch Hardware Company of Denver, Janney, Semple, Hill & Co. of Minneapolis, and 40 other houses, representing nearly every important trade center of the country. Negotiations are still pending with other houses, and it is expected that there will be further accessions to the number already enrolled in the combination.

Several names have been suggested for the consolidation, such as the International Hardware Company, National Hardware & Metal Company, International Hardware & Metal Company, and there is little doubt that one of these will be chosen, but the precise form of the name has not yet been positively determined.

The organization not being technically completed, there has been no formal choice of officers. It is, however, purposed that the officials shall be as follows:

President, E. C. Simmons.

Vice-President, John Bindley.

Chairman of the Executive Committee, W. D. Simmons.

There will be a Board of Directors, consisting of from 25 to 30 persons, representing the different sections of the country. There will also be an Executive Committee of nine, of which the president and vice-president will be ex-officio members.

It is intended to incorporate under the laws of New Jersey with a capital of $120,000,000, $40,000,000 6 per cent. cumulative preferred and $80,000,000 common stock.

The general headquarters for buying and selling and transportation of goods will be in St. Louis. The Eastern headquarters will be in New York City, and under the charge of Mr. Bindley, who will also be chairman of the Finance Committee. The members of the Executive Committee residing in the East with Mr. Bindley will manage the Eastern business of the corporation. The Eastern office will have charge of the finances and of the auditing and insurance of the company, as well as the general direction of all the houses in Maryland, Pennsylvania, New York and New England. The general buying for the company will be from the St. Louis headquarters, where the larger contracts will be placed, but the smaller buying will be done by the local houses.

The concerns constituting the company will continue, for the present at least, without change, and so far as the public would observe business will run on as before the consolidation. The principle of home rule will be recognized in connection with the local houses, who will make their own selling prices, except so far as this may interfere with the buying department or the expressed wishes of the manufacturers, which it will be the policy of the company to respect. Each house will be held responsible for the results of their business, and if these are not satisfactory the house will be closed up.

It is intended to continue the present force of salesmen connected with the various houses, so that existing personal relations between wholesale and retail distributers will be preserved.

The company expect that their policy will meet with the hearty approval of the retail trade, to whom they look for liberal support. All retailing from wholesale houses will be stopped, except so far as they may have separate and distinct retail departments conducted on retail principles and selling at proper retail prices. The company's business will be confined almost entirely to retail hardware dealers, railroads and large manufacturers whose purchases are of such magnitude that they would not be willing to buy from retailers. They hope also that something may be done in the way of discouraging the sale of cheap goods and in preventing department stores and catalogue houses from advertising prices which do not allow a reasonable profit for the regular retail merchant. They base their expectation that they will receive a large part of the trade of the retail merchants on the excellent service they will give, especially in the line of prompt shipments and considerate and businesslike treatment and methods.

Large and complete stocks will be carried by all the different houses, so that prompt shipments will be made with a view to serving the interests of the retail trade, with whom the company regard promptness in the supply of goods as exceedingly important. Each house will give special attention to the cultivation of their own immediate territory and thus avoid the evils of attempting to cover sections which are at a disadvantageous distance. The trade are familiar with the evils connected with the practice, which has of late been prevalent in an aggravated form. The company expect to meet all legitimate competition, but intend to avoid cutthroat methods, their aim being to do business on more conservative and reasonable lines than has been possible under existing conditions.

CALIFORNIA STATE RETAIL HARDWARE ASSOCIATION.

The first annual meeting of the California State Retail Hardware Association was held in the Palace Hotel, at San Francisco, on Monday and Tuesday, March 10 and 11. The convention was presided over by the president, O. F. Sites of the Palace Hardware Company of San Francisco, and the members of the association were welcomed by Eugene Schmitz, Mayor of San Francisco.

The Central Retail Hardware Association, the San Joaquin Retail Hardware Association and the Southern Retail Hardware and Implement Association announced their desire to affiliate with the State Association and comply with the requirements of its constitution and by-laws. President Sites addressed the convention and outlined the aims and purposes of the organization, which was started in February, 1901, by the affiliation of two local associations—the Pacific Retail Hardware Association and the San Francisco and Oakland Retail Hardware Association.

Resolutions in memory of the late Frank F. Osborn, the treasurer of the association and formerly president of the San Francisco and Oakland Association, were adopted. A paper on "Sub-Organization," which was read by G. A. Gutman, was enthusiastically received and favorably commented upon.

The nominating committee reported the following nominations for officers and Executive Committee, to serve during the ensuing year:

PRESIDENT, O. F. Sites, San Francisco.
VICE-PRESIDENT, G. A. Gutman, Germantown.
SECRETARY, Henry Gracey, San Francisco.
TREASURER, H. C. Bennett, San Francisco.

EXECUTIVE COMMITTEE.

SAN JOAQUIN: C. W. Barrett, Fresno; Theo. Turner, Modesto.
CENTRAL: E. A. Eaton, Salinas; J. W. Baxter, Watsonville.
SOUTHERN: Wm. F. Lutz, Santa Anna; E. C. Dawe, Santa Barbara.
PACIFIC: John C. White, Marysville; A. L. Nichols, Chico.
SAN FRANCISCO AND OAKLAND: S. V. Armstrong, San Francisco; M. M. Brown, San Francisco.

The nominations were approved by the convention, the election being made by acclamation. The time and place for holding the next annual meeting was, by the consent of the convention, left to the discretion of the Executive Committee. On Wednesday an enjoyable entertainment was prepared for the delegates.

WISCONSIN REFRIGERATOR COMPANY, Eau Claire, Wis., have issued a catalogue of the Wisconsin Peerless and Badger Refrigerators. Referring to the former line, they state that this season they have still further increased its efficiency by the introduction of several new features, which are described. A folder is also issued relating to their Peerless Enameled line, which is said to embrace all of the best features of their Peerless, with the addition of a thoroughly white enameled provision compartment.

The Noxall, Jr., Filter.

The American Filter Company, 133-135 Michigan street, Milwaukee, Wis., are the manufacturers of the Noxall, Jr., filter, illustrated herewith. This filter is made with spun copper top and cast brass bottom, tinned on the inside, and with highly polished nickel plated exterior. The top is fitted with the company's improved rubber attachment, which is spun into the shell, making it practically indestructible and easy to slip onto any faucet. The filter is 2 x 4 inches in size, weighs 12 ounces complete, and has a filtering capacity of 10 gallons of water per hour. The filtering medium used is the natural germ proof Noxall stone, the same as is used in all the company's high grade Noxall filters. In Fig. 2 is shown a sectional view of the filter, indicating its construction and operation.

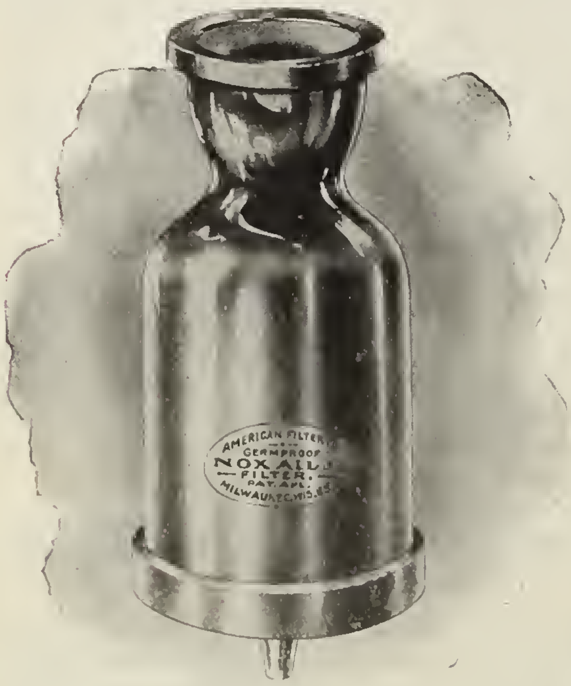

Fig. 1.—Exterior View.

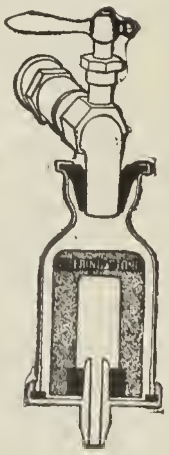

Fig. 2.—Sectional View.

The Noxall, Jr., Filter.

Improved Champion Germ Proof Water Filter.

The Champion Safety Lock Company, Cleveland, Ohio, have brought out the Champion Germ Proof water filters, here illustrated. These filters—five in number—are designed for use in connection with faucets having either threaded or plain outlets. The filters are made of brass, nickel plated, the filtering medium being a Tripoli natural stone tube, from the outer surface of which germs and arrested filth are easily removed. To remove the filtering tube for cleaning it is only necessary to give the bottom a half turn to the left, when the tube can be withdrawn, quickly cleaned, returned to and locked in its proper place, and a water tight joint is automatically made by a simple and ingenious arrangement. Fig. 1 illustrates the style C filters, which have a special three-way faucet attachment for the delivery of either filtered or unfiltered water to be drawn without detaching the filter from its position on the faucet. Fig. 2 shows the small size D filters, for attaching directly to the lower end of the faucet. The advantage claimed by the manufacturers for this line of improved filters is that they make possible sterilized, aerated and sparkling water, and minimize the danger of such diseases as are commonly introduced through the medium of impure water. Catalogues of their entire line will be sent to those interested on application.

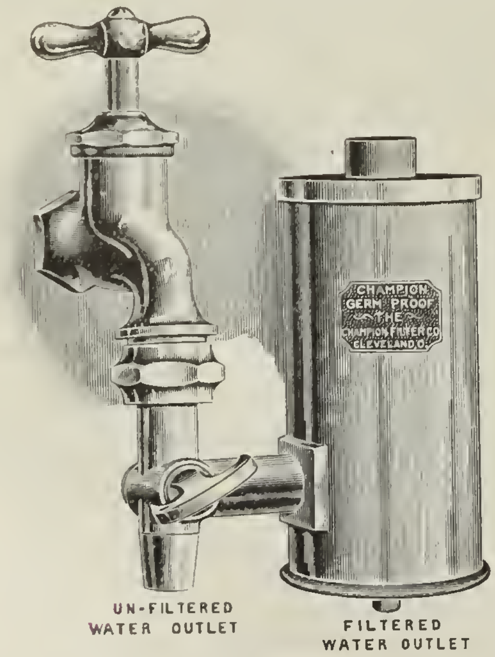

Fig. 1.—Champion Germ Proof Water Filter.—Style C.

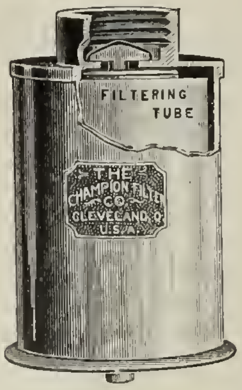

Fig. 2.—Style D Filter.

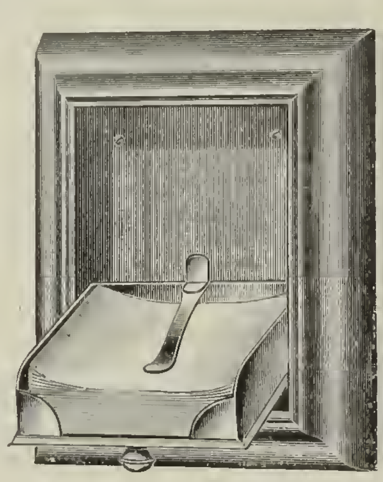
Enclosed Toilet Paper Holder.

The Searls Mfg. Company, Newark, N. J., whose New York representative is Frederic Klages, 127 Duane street, have added to their comprehensive line of bathroom and household specialties in nickeled brass the Enclosed toilet paper holder, here illustrated, patent on which has been applied for. The important feature of this construction is that except when in use the toilet paper or interior is not seen, making the handsome exterior in keeping with the other attractive appointments of modern bathrooms. The holder is held in position on the wall by means of two inside oval head screws, seen in the illustration. The tray for the paper, taking sheets up to 5 x 7 inches, is pivoted near the bottom on each side, so that by a slight pressure on the front knob it can be either opened or shut, the sheets being kept in position by a flat spring, as shown. The holder is 8¾ x 10½ inches over all, extends from the wall outward 2½ inches, and is finely polished and nickeled.



Enclosed Toilet Paper Holder.

A NOTICE of the dissolution of the copartnership of Whitcomb, Kirkham & Gray has been issued by J. Stewart Kirkham, who will continue to carry on under his own name a Stove, Furnace and Tinware business at the old stand, 140 State street, Springfield, Mass.

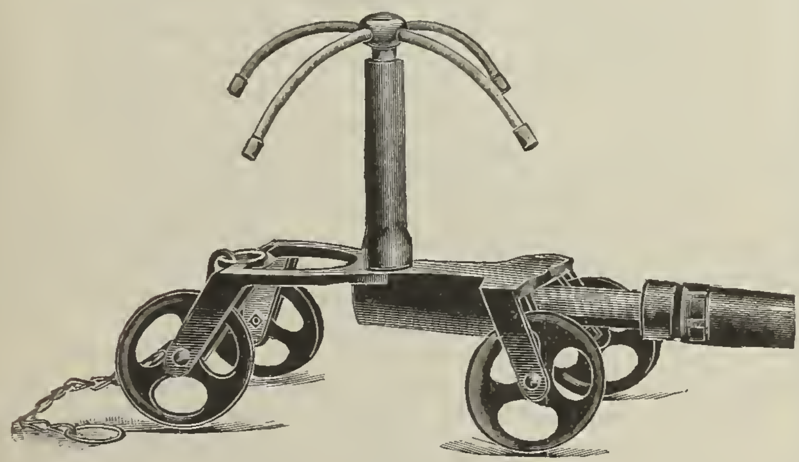
Storing Pot Covers.

A correspondent in Springfield, Mass., writes as follows in relation to the method he has found most handy for storing pot covers:

During the last 40 years we have tried several ways of keeping pot covers so as to enable us to get the right size when wanted. We have used shelves, upright standards on shelves and a stand 6½ feet high, 12 inches at the top and 20½ at the floor, with 13 shelves for covers, but in spite of the utmost care they would get mixed. Now, we have each cover marked the exact size, and hang some two dozen of them on a wire or strong cord, which is strung up in a convenient place. A variety of covers, from 8 inches to 13½ inches in diameter, are hung on each cord; then when a cover of any particular size is wanted we have only to go to these strings of covers and readily find the size needed, getting it the first time, if the right measurement is given. This way of handling covers prevents their becoming mixed up. They are out of the way, and when the supply on the strings gets low and more are wanted, we can readily tell the sizes that are short and order enough to fill up the strings, which hold either one or two dozen covers apiece. In these days when haste is often unavoidable in waiting on customers who wish to get something right away, we find the method described decidedly the best we have yet tried.

New Century Lawn Sprinkler.

Yost-Miller Company, Toledo, Ohio, are manufacturing the New Century lawn sprinkler here shown. The sprinkler is mounted on a four-wheel platform, suitably braced in every direction, the construction being such that the device can be readily wheeled from one point to another without being upset. It is so arranged that any circle, from 2 feet in diameter to 50 feet diameter, can be sprayed with an equal distribution of water. At the opposite end from the coupling to which the hose is attached there is a chain with large ring by which to move the apparatus about.



New Century Platform Lawn Sprinkler.

Stove and Hardware Dealers.

William Cooper has embarked in the Stove and Tinware business at Vincent Town, N. J.

The Tea Tray Company of Newark, N. J., are erecting a one-story brick warehouse, 40 x 125 feet, adjoining their factory at Mulberry and Murray streets.

The Sanitary Dust Pan Company, with principal office at 1232 Market street, Camden, N. J., have been incorporated by Henry L. David, Thomas Clover and George B. Smith, with a capital of $125,000, to manufacture Sanitary Dust Pans, &c.

Charles T. Wilson has started in the retail Stove and Tinware business at Libertytown, Md.

The Trenton Lamp Mfg. Company of Trenton, N. J., have organized and are now doing business under the new title. At a meeting held recently officers and directors were elected as follows: President, H. Van Iderstine; secretary and treasurer, A. J. Fondeville. These officers, together with the following, form the Board of Directors: George Reuter, Jr., of the American Wringer Company; Oscar O. Brewer of the Newark Fire Insurance Company, and Charles G. Hookway of Jersey City. The new company have a capitalization of $150,000 and propose making a number of additions and improvements to their plant and products.

John P. French has formed a partnership in the Hardware, Stove and Agricultural Implement business with Joseph Hare of Bismarck, N. D., under the style of Hare & French. The firm expect to enlarge their stock from time to time, and have already put in a line of Harness and Paints.

Bellevue Pump Company, Bellevue, Iowa, are sending out a catalogue and circulars relating to Kegler's Patent Galvanized Iron Chain Pump Tubing and Curb.

Grand Rapids Refrigerator Company, Grand Rapids, Mich., are distributing a catalogue of more than 100 pages illustrating their line of Leonard Cleanable Refrigerators, including Porcelain Lined and Porcelain Lined Oak Refrigerators, Grocers' Refrigerators, Ice Chests, &c., for the season of 1902.

The Baldwin Refrigerator Company, Burlington, Vt., are sending a folder calling attention to their Baldwin Porcelain Lined Refrigerators, which are offered in nine handsome styles. The outside cases are made of solid oak, with fine raised panels, and trimmed with plain polished nickel plated lever locks and hinges.

C. Kimmell Company, wholesale and retail Hardware, Stoves, Tinware, Agricultural Implements, Harness, Vehicles, &c., El Reno and Weatherford, O. T., have been incorporated with a capital stock of $75,000. The directors of the company are C. Kimmell of El Reno and M. L. Wood and W. T. Shoemaker of Weatherford. The main establishment will be at El Reno.

The National Enameling & Stamping Company of New York, Chicago, St. Louis, Milwaukee and Baltimore are calling the attention of the trade to their fine line of Water Coolers. The company announce that they are prepared to furnish all kinds and sizes of these goods at immediate notice. Large stocks of Coolers are carried at all their branches.

Industrial Exposition in Japan.

The Government of Japan will hold a great national industrial exposition at Osaka, opening March 1 and closing July 31, 1903. A special feature of this exposition, which is primarily a national one, to which the Japanese Government calls the attention of foreign manufacturers, is the establishment in connection with it of a special building for samples of such articles manufactured in foreign countries as may be of value for purposes of comparison or reference in the interests of the industrial advancement of Japan. The primary object aimed at is to afford Japanese manufacturers an opportunity of studying the latest practice of Western invention, with a view to the improvement of the native industries. United States Minister Buck, writing from Tokio to the State Department at Washington, reports that foreign exhibits which are to be used solely for the purpose of the exhibition and which will be re-exported within two months of its close, will be exempt from customs duties. The space set aside for foreign exhibits amounts to about 500,000 square feet. Intending exhibitors are requested to forward applications for space to the office of the Chief Commissioner for the Fifth Industrial Exhibition, at the Department of Agriculture and Commerce, Tokio, not later than June 30, 1902. Such exhibits as are accepted will have to be placed in the building between January 5 and February 20, 1903. The arranging of exhibits of manufacturers who cannot attend to the matter personally or by deputy will be undertaken by the office of the Chief Commissioner on request in writing. No medals or other prizes will be awarded to foreign exhibitors, but in the case of exhibits which are considered to have special merits a letter of thanks will be sent to the exhibitor. The Imperial Government of Japan is trying to arrange special freight facilities for all foreign exhibits.

Commencement Exercises at the New York Trade School.

More than 1000 students and their friends gathered in the gayly decorated auditorium of the New York Trade School, at Sixty-seventh street and First avenue, New York City, on Wednesday night, to attend the commencement exercises of the twenty-first season of the school. In passing through the different shops, those who have visited the school for a number of years could not fail to be impressed with the general excellence of the work and the improvement over the work of past years shown by the pieces on exhibition.

The commencement exercises were opened at 8.30 p.m. by the president of the school, R. Fulton Cutting, who introduced Edward Murphy, chairman of the Trade School Committee of the Master Plumbers' Association. Mr. Murphy expressed his pleasure at being greeted by so many enthusiastic young plumbers, and congratulated them on the very high degree of excellence shown in their work. He said that, like all its predecessors, the class of 1901-1902 had surpassed the achievements of its predecessors, this fact being demonstrated both in their exhibition work and in their examinations, in which he had taken a personal part. He expressed his pleasure that the instructors of the school, not in the plumbing class alone, but in all the classes, seemed to have acquired a mastery of the art of teaching their pupils, and congratulated them on the result, as shown by the high proficiency reached by each class. Mr. Murphy pointed out the possibilities of the future, illustrating the point by stating that it had given him great pleasure to be approached familiarly by a delegate at one of the conventions of the National Association of Master Plumbers, who had outgrown his recollection, but who proved to be a graduate of the New York Trade School, and who reflected credit on the institution by the high place which he had reached in the business world. He urged each of the graduates to strive to reach a similar position. The New York Trade School he regarded as an invaluable institution, not only in the direct good which it does by its own work, but also in being the parent of other trade schools, and, through them, doing great good to an immense number of young men throughout the country. He expressed the opinion that the high standard set at the school and the excellent start it gives to young men not only produces a high grade of plumbers, but also proves that the time of young men to-day is too valuable to be spent in a long apprenticeship. Improved systems of instruction have shown that as much can be taught in as few months as the old apprenticeship system took years to teach, and the school has the effect of turning out a better qualified beginner to attempt the mastering of the trade. The grand opportunity his hearers had enjoyed in this invaluable institution was due, he said, to the interest its founder, the late Col. Richard T. Auchmuty, took in giving the American boy a chance to become a valuable citizen, and no better monument could be erected to his memory than his dearly loved New York Trade School.

At the close of Mr. Murphy's remarks President Cutting introduced William H. Oliver, president of the General Society of Mechanics and Tradesmen of the City of New York, who said in substance: "Success in any vocation is not the result of accident, but of careful training. In every branch of life there is a why and a wherefore, and those who apply themselves can learn them. They will find the search for information an inviting one, which will create a thirst for more. Nothing makes such competent, self reliant tradesmen as the knowledge acquired by those who make the best of their opportunities. When you leave here it depends on the use you make of your opportunities how you will succeed, and on you alone it depends to use the right methods to achieve the highest success. Broad and liberal methods will suggest co-operation with others to benefit and be benefited on the road to success. Associations have always proved beneficial when invested with the right spirit and having high aims. You have been here but a short time to prepare, and there is yet much to learn. Be ever ready to act up to your highest information and your efforts will be crowned with success."

The certificates of the graduates were then distributed by Thomas J. Tuomey of the Master Plumbers' Association and John H. McCullagh of the General Society of Mechanics and Tradesmen, after which Superintendent H. V. Brill read the names of the graduates on the roll of honor, placed there by their excellent records.

When all the certificates had been distributed D. M. Russell, on behalf of the plumbing class, spoke of the enjoyment experienced in the four months' course at the school and the grateful feeling held for each instructor. He then presented each of the instructors with a token of the appreciation of the members of the class.

The gifts were acknowledged on behalf of the instructors by John Delehanty with a few brief remarks. T. B. Walmsley, the instructor in lead burning, and Edward L. Bahr, superintendent of the steam fitting class, were also pleasantly remembered by their respective classes, and an announcement was made that the cornice class had sent to the residence of their instructor, William Neubecker, a handsome oak roll top desk.

On behalf of the *Painters' Magazine* J. Barton Allen presented a gold medal to the most proficient student in the painting class, which was received by Orville T. Crane of Atlantic City, N. J. The Industrial Publication Company, whose editor had graduated from the carpentry class, presented a set of technical books to the best pupil in the carpentry class, which was gained by Andrew Schillinger of Garfield, N. Y., honorable mention being made of S. W. Brown. George A. Suter then presented, on behalf of the committee of the New York City Master Steam and Hot Water Fitters' Association, their gold medal to the most proficient young steam fitter, and though all in the class were said to have done remarkably well, John T. Huber of Erie, Pa., secured the coveted honor, A. A. Thompson of Detroit and E. D. Sorg of Brooklyn securing honorable mention.

The exercises were then closed by some well chosen remarks by President Cutting, who pointed out the value of trades unions when they teach men to live for each other, rather than for themselves, so that all of the members may be benefited.

Another branch of instruction at the school not mentioned in the general commencement exercises, which has been conduced by A. A. Hammerschlag, consists of a series of practical demonstrations and discussions for stationary engineers and electrical workers. During the past season these informal talks were attended by 195 men engaged in these lines, who came not only from New York City, but also from towns at a considerable distance, on the dates set for the discussion of some set topic as arranged on the list of topics which was sent quite generally to men engaged in these lines.

Roll of Honor Graduates.

DAY PLUMBING CLASS.

Paul H. Keller, Shelton, Conn.
Benjamin F. Miller, Gainesville, Fla.
Harry L. Hanson, Butte, Mont.
Andrew J. Hummel, New Ulm, Minn.
Charles A. Rote, Stockbridge, Mass.
Charles V. Baumann, Newark, N. J.
Clarence A. Gray, Allegheny, Pa.
C. P. Ashley, Brooklyn, N. Y.

EVENING PLUMBING CLASS.

Nicholas J. Vincent, New York.

DAY CORNICE CLASS.

Albert Kastner, Louisville, Ky.
Max Wm. Pehl, Poughkeepsie, N. Y.

DAY STEAM FITTING CLASS.

John F. Huber, Erie, Pa.

EVENING STEAM FITTING CLASS

Charles Schwenker, Brooklyn, N. Y.

Regular Graduates.

DAY PLUMBING CLASS.

Allen, Loren D., Hammond, N. Y.
Armstrong, Chas. L., Wheeling, W. Va.
Ashley, Chas. P., Brooklyn, N. Y.
Berry, Dwight C., Roseburg, Ore.

Borthwick, John A., Portland, Ore.
Baumann, Charles V., Newark, N. J.
Becker, George, Maquoketa, Iowa.
Buchtenkirch, John, New York City.
Cook, William G., Bushkill, Pa.
Curran, Joseph V., Wappingers Falls, N. Y.
Doran, Edward F., Greenville, N. J.
Dour, Leon T., New York City.
Doering, Frank L., Wapakoneta, Ohio.
Delacour, George A., Derrick City, Pa.
Dickinson, James W., Port Washington, N. Y.
Donahue, Thomas F., New York City.
Evans, John T., Butte, Mont.
Enright, Michael J., Raritan, N. J.
Ford, Thomas J., Brooklyn, N. Y.
Finn, James, Youngstown, Ohio.
Fretz, Harry N., Cedar Grove, N. J.
Gay, Henry K., Nashua, N. H.
Garrison, Ralph H., Vineland, N. J.
Gunther, Jno. M., Jr., Spring Valley, Ill.
Grant, William D., Kane, Pa.
Gould, Clarence R., Friendship, N. Y.
Gray, Clarence A., Allegheny, Pa.
Howard, John G., Raleigh, N. C.
Hogan, Thomas E., New York City.
Hanson, Harry L., Butte, Mont.
Hummel, Andrew J., New Ulm, Minn.
Hewes, Frank L., Osceola Mills, Pa.
Harding, Stedman, Tunhkannock, Pa.
June, Carroll A., Brandon, Vt.
Keller, Paul H., Shelton, Conn.
Kennard, Frank C., Roanoke, Va.
Kane, Thomas A., New Brunswick, N. J.
Kane, Michael J., New Brunswick, N. J.
Konow, Louis, Newark, N. J.

Kastner, Albert, Louisville, Ky.
Kretchmann, Gustav, Brooklyn, N. Y.
Pehl, Max W., Poughkeepsie, N. Y.
Schrumpf, William T., West Hoboken, N. J.
Weeber, Otto J., Guttenburg, N. J.

Oxygen Regenerator.

The oxygen regenerator for purifying vitiated air is being adopted by the Fire Department of Paris, France. It weighs only 5 pounds, says *Fire and Water*, and is based on the principle that sodium bioxide in continual reaction with water will render respirable an atmosphere which it would be impossible otherwise for any living being to breathe. A clockwork apparatus drops at regular intervals pieces of sodium bioxide into a water section of an aluminum ventilator. The firemen intending to enter poisonous air put on divers' dress and carry an oxygen respirator connected with a helmet by two rubber tubes. The apparatus contains 150 grams of sodium bioxide, which insures an adequate supply of oxygen for respiration during one hour.

Proposed Foundry Trade School.

In the *Journal* of the American Foundrymen's Association for March is a paper by Thomas D. West, in which he urges the need of an endowed school for teaching the trade of molding and the management of foundries. Mr. West is the chairman of a special committee of the American Foundrymen's Association, appointed for the purpose of furthering the project for the establishment of such a school. He argues that the limited knowledge of the trade required by the average molder under present conditions generally fails to imbue the workman with the ambition to excel in this trade that would be awakened by an education which would give him a fuller insight into the theory and practice of all branches of the foundry trade. He also claims that the present lack of any kind of scientific training for foundrymen results in the lack of use of their natural intelligence on the part of most workers in foundries, who entirely lose sight of the fact that increased skill and knowledge would command for them higher wages and advancement in their trade. Mr. West proposes that a course at such a school as is projected should cover three and a half years, and the plan would be to impart all information possible in the three branches of molding—viz., green sand, dry sand and loam, and in the management of cupolas. This course, Mr. West asserts, would result in turning out better mechanics than does six or seven years' experience in a general foundry, under present conditions. He would include in the curriculum the study of mechanical drawing, chemical and physical metallurgy and business forms and practice, as well as lectures on the general principles of founding, the instruction being given on three or four evenings of each week. The school, he says, should be located in a prominent iron center, and he believes that it could be easily established for from $75,000 to $100,000. With this end in view he appeals to philanthropists and those interested in the subject for assistance in endowing an institution of the character described, which would help to the acquirement of a highly remunerative trade poor youths who might otherwise go through life unskilled and without prospect of earning more than a mere subsistence. He believes that a school of this kind would in time become more than self supporting. The committee of the proposed foundry trade school consists of Thomas D. West of Sharpsville, Pa., chairman; E. H. Putnam of Moline, Ill., and Dr. Richard Moldenke of New York City.

Molders' Strike at Chattanooga.

All the union molders in Chattanooga, Tenn., went out on strike last week as a result of the attempt of the Ross-Mehan Foundry Company to put a nonunion foreman of a negro shop in as foreman of the union shop. One-third of the nonunion white molders also walked out. The molders demand that all negro workmen employed by the company in shops with white workmen be discharged or transferred to shops working only negroes. These include all the large foundries and manufacturing establishments of iron goods in Chattanooga. Among those which the strike affects especially are the Casey and Hedges Mfg. Company, one of the largest boiler factories in the South; the Cahill Iron Works, makers of grates and iron mantels; the Southern Malleable Iron Works, the Price & Evans brass foundry, the Chattanooga Car & Foundry Company, the Ross-Mehan Company, the Chattanooga Soil Pipe Works and a number of other smaller concerns. A general strike of all foundry employees is said to be threatened. The companies are now running mainly with negro hands. The situation is complicated and seems to depend on the ability of the foundry companies to secure outside help.

SUPPLY MEN AT ATLANTIC CITY.

It has been previously announced that an effort was being made to have the plumbing supply trade to meet at Atlantic City, N. J., at about the time of the annual convention of the National Association of Master Plumbers. The result has been that the Association of Manufacturers and Jobbers of Plumbing Supplies, which has its membership east of the Alleghany Mountains, will hold a meeting at the Hotel Chelsea, Atlantic City, on Wednesday, June 11. While the Central Supply Association, composed of Western members of the trade, has arranged to meet at Put In Bay, Ohio, on June 23, representatives of this association will attend the meeting at Atlantic City, and it is probable that the deliberations of both bodies will be conducted on practically parallel lines.

While the definite statement cannot be made at this time that the differences beween the Supply Associations and the Master Plumbers' Association are to be adjusted, efforts to that end have not been lacking on the part of those who have the best interests of both bodies at heart, and there are grounds for the hope that the assembly of conventions at Atlantic City this year will close with a mutually satisfactory adjustment of the existing issues. Such a conclusion would greatly increase the enjoyment by all who are delegated to represent the interests of their associates of a sojourn at this great seaside resort.

SUMMER MEETING OF THE HEATING ENGINEERS.

Owing to the number of men interested in heating who will be in attendance at other conventions at Atlantic City in June, the Board of Governors of the American Society of Heating and Ventilating Engineers have decided to hold a summer meeting of the society at Atlantic City on June 16. A call for this meeting having been ordered by President A. E. Kenrick, it was issued by the secretary, W. M. Mackay, under date of April 10. Information as to the place for holding the meeting and the hotel accommodations will be issued later. Owing to the other conventions assembling at Atlantic City at the same time, the members will be enabled to secure transportation at the rate of a fare and a third for a return trip ticket. Doubtless the members will be requested to prepare papers and present topics for discussion at this meting.

President Kenrick announces the appointment of the following committee to work in conjunction with the Board of Governors in making arrangements for a special anniversary meeting at the tenth annual meeting of the society, which will be held in New York City in January of 1904: Frank K. Chew, Hugh J. Barron, B. F. Spangland and P. H. Seward of New York City; W. H. Switzer, Utica, N. Y.: Andrew Harding, Detroit, Mich.; Robert C. Clarkson and P. Gormly, Philadelphia; Andrew G. Paul, Boston, and James H. Davis, Chicago.

HEATING BOILERS.

Wherever the manufacturers of steam and hot water boilers have met for several months past the advisability of advancing prices has been discussed, and as there are two sides to the question strong arguments have been presented on both sides. Since January 1 an advance of about 20 per cent. has taken place in the price of iron, and recently there has been an advance in molders' wages. Furthermore, all of the different fittings and fixtures which go into the construction of the house heating boiler also cost more money. In view of these facts those who favor an advance in price have a stronger argument than heretofore. Still there are not wanting some who argue that a conservative policy, which would prevent, or at least delay, any advance in price for the present, would tend to the best interest of the whole trade. Those heating contractors who are canvassing for prospective sales can hardly make an error if they urge an early decision on the part of their customers, so as to enable them to place, as early as possible, specific orders for goods needed. Where it is found impossible to close contracts early it will be well to figure and estimate so as to guard against being caught by an advance, or to provide for a clause in estimates and bids which will secure the contractor in case advances should be made. Those who are successful in closing contracts early can not only prepare to complete the work advantageously, but will have more time to canvass for further business, and they will have a good argument to influence more trade. The earlier work sets in for the fall the more each one can accomplish. Further, even should boiler prices continue unchanged, past experience demonstrates that there are other factors in a heating apparatus which are apt to fluctuate more readily.

Death of Joshua Lambert.

Our readers will regret to learn of the death of Joshua Lambert, vice-president of the Clayton & Lambert Mfg. Company, Detroit, Mich., which occurred on March 1. Mr. Lambert's health had been steadily failing for over a year, but his interest in the company's business, which he had been instrumental in building up from a small beginning to its present large proportions, brought him daily to the factory, and although unable to perform his customary duties, up to the last day of his life he gave the company the benefit of his counsel and was deeply interested in all that advanced their interests. The immediate cause of death was heart failure. Joshua Lambert was born in Livonia, Mich., on February 14, 1834. The Clayton & Lambert Mfg. Company were organized in 1889, with Milton J. Clayton as president, Joshua Lambert vice-president, and J. E. Lambert secretary and treasurer. These officers, together with Charles R. Lambert and Bert Lambert, formed the Board of Directors, all having served the company continuously since their organization. The three last named are sons of the late Joshua Lambert. Mr. Lambert's attractive personal qualities endeared him to a large circle of attached friends. His sunshiny disposition and his anxiety to make life pleasant for others, made friends of all who knew him. This was particularly the case with the employees of the Clayton & Lambert Mfg. Company, to whom his death came as a personal loss. He leaves a widow, three sons and one daughter, all of whom reside in Detroit.

THE LATE JOSHUA LAMBERT.

THE SANDUSKY PLUMBING & BOILER COMPANY of Sandusky, Ohio, have secured the contract for furnishing and making all the pipe and valve connections at the new factory of the American Crayon Company. The Buffalo Forge Company will install the plant for drying the crayon and for ventilating and heating the building.

THE STEAM FITTERS' CONVENTION.

The following notices have been sent out for the annual convention of the National Association of Master Steam and Hot Water Fitters:

To All *Master* Steam and Hot Water Fitters of the United *States*.

The fourteenth annual convention of the National Association of Master Steam and Hot Water Fitters will be held in Atlantic City, N. J., on June 12, 13 and 14, with headquarters at Hotel Rudolf.

For the benefit of those who are not familiar with the present workings of the association, we will state that about eight years ago the men who wisely directed the affairs of the National Association saw that the best way to secure the objects sought for was to at once declare to the trade that "Trade Protection" meant what the words implied—to wit, the protecting of the contracting master fitter.

This was done by promulgating "Trade Resolutions," adopted by the National Executive Committee September 24, 1894, and indorsed by the seventh annual convention, held at Philadelphia, June 15, 1895.

Some difference of opinion as to the feasibility as well as the practicability of the resolutions as originally proposed and amended from time to time caused the members to make a change in the wording and purport at the eleventh annual convention, held in Buffalo, June 7, 8 and 9, 1899.

Manufacturers and dealers have been very liberally treated under the works of the present resolutions, and they certainly cannot complain of any unjust or unreasonable requests emanating from this association.

There are without doubt numerous master fitters in this country who ought to consider their own welfare to the extent of becoming a member of their trade association, and thereby exhibit a spirit of fraternity which would directly and indirectly, sooner or later, be of material benefit to themselves and the trade at large.

An invitation to join this association has heretofore been extended to the trade at large, and is repeated at this time. It must be borne in mind, however, that only such as can demonstrate that they are regularly established in business and worthy of recognition as master steam and hot water fitters are eligible to membership in the National Association.

Bear in mind that the fourteenth annual convention is not a convention for delegates only, and the ordinary sessions of the convention will be open to the trade at large, but the executive sessions can only be attended by members.

Headquarters and meetings will be at Hotel Rudolf.

Yours fraternally,
National Executive Committee.
Chairman, Henry L. Hall, New York.
John J. Collins, St. Louis, Mo.
John D. Hibbard, Chicago, Ill.
Edward Tunstead, Minneapolis, Minn.
Francis A. Williams, New York.
President, Stewart A. Jellett, Philadelphia, Pa.
Vice-President, Alfred E. Kenrick, Brookline, Mass.
Treasurer, Albert N. Chambers, New York.
Secretary, Henry B. Gombers, New York.

To the *Manufacturers* and Dealers in Accord with the National Association of *Master* Steam and Hot Water Fitters:

Gentlemen: We herewith extend to you a hearty invitation to attend the fourteenth annual convention of the National Association of Master Steam and Hot Water Fitters, which will be held in Atlantic City, N. J., on June 12, 13, and 14, with headquarters at Hotel Rudolf.

We will be glad to welcome the manufacturers and dealers who so honorably stand with us in preaching and practicing trade protection.

Come to the convention with the idea of renewing old acquaintances as well as to make new ones.

This invitation in the Bulletin is to be considered the "Official Call" to manufacturers and dealers in accord.

Trusting that we will see a goodly number "In Accord" at Hotel Rudolf, Atlantic City, N. J., June 12 to 14 next, we remain.

Yours very truly,
National Executive Committee.
By Henry L. Hall, Chairman.
Henry B. Gombers, National Secretary.

◆

The Master Plumbers' Association of Bayonne, N. J., have appointed the following committee to arrange an amalgamation with the Bayonne Building Trades Council: J. T. Gilbertson, W. F. Haskard, John Davaney. The following committees have also been named: By-laws, J. Davaney, T. J. Conroy, William Higgins; License, John Higgins, W. T. Haskard, John Davaney; Price-List, John Higgins, John Davaney, Harry Eipstein, W. O'Neil, W. C. Devlin; Arbitration, John Hovell, A. T. Gill, W. F. Haskard, T. Conroy, F. Denton.

◆

NEW YORK STATE STEAM FITTERS' MEETING.

The following call has been issued for the New York State steam fitters' convention:

The eighth annual convention of the Master Steam and Hot Water Fitters' Associaion of the State of New York will be held in the city of Schenectady on Friday, May 2, 1902. Meeting will be held at the Edison Hotel.

A meeting of the Executive Committee will be held Thursday, May 1, at 8 o'clock p.m., and the convention will be called to order at 11 o'clock a.m. on Friday, May 2. The business of the convention will no doubt be completed and adjournment had on Friday.

At this meeting the annual election of officers will take place and other business of importance be presented. Our association is in good working order, but we need your personal help to give it the strength that it should have in order to cope with the serious questions which all master fitters of this State will meet with during the current year. All master fitters who are regularly engaged in the business are invited to attend the meeting and be present at all sessions, except executive sessions.

This is not a delegates' convention, as every member in good standing is entitled to be present. As it is naturally the quiet season of the year for our members, we shall expect a very large attendance.

Henry L. Hall, President.
John W. Danforth, Secretary.

◆

New York City Notes.

Although there are many large jobs under way, the plumbing contracts for which have been given out, very little work is yet ready for the plumbers and the busy shop is the exception. Jobbing business has completely fallen off, there being nothing doing in that line in any of the shops.

⁂

The Greater New York Association had a large meeting last Monday at the rooms of Manhattan Branch.

⁂

Richmond Branch had better get together, or the baby in the Bronx will walk far past it.

⁂

Manhattan Branch will elect delegates to the National Convention at a meeting on April 15.

⁂

Judging from the number of signs that have come down lately, some of which have been up for years, the Bureau of Buildings is strictly enforcing the law against the exposing of such signs by unlicensed plumbers. A few prosecutions with conviction and heavy fines would put most of these people out of business.

⁂

Apparently the Tenement House Department is having trouble in getting field inspectors from the Civil Service Board. It has not as yet made its influence felt so as to affect the plumbing trade by orders for changes.

⁂

The Water Department is much exercised over the waste and is talking about having meters placed in every building. Should this step be taken it will mean considerable business for the trade.

⁂

Among the plumbers who have good contracts in hand are W. Y. Jack & Co. of 730 Lexington avenue, who have a ten-story loft building for the Bliss Estate on Twenty-third street, between First and Second avenues; the Speyers School, a young ladies' college, at Lawrence street and Amsterdam avenue, and a private house for F. G. Loyd at 36 East Sixty-first street, of which C. P. Webster is the sanitary engineer. T. J. Cummins has just finished plumbing a large piano factory at Eleventh avenue and Fiftieth street.

FLUSHING AND CLEANING SMALL TERRA COTTA SEWERS.

BY J. N. S.

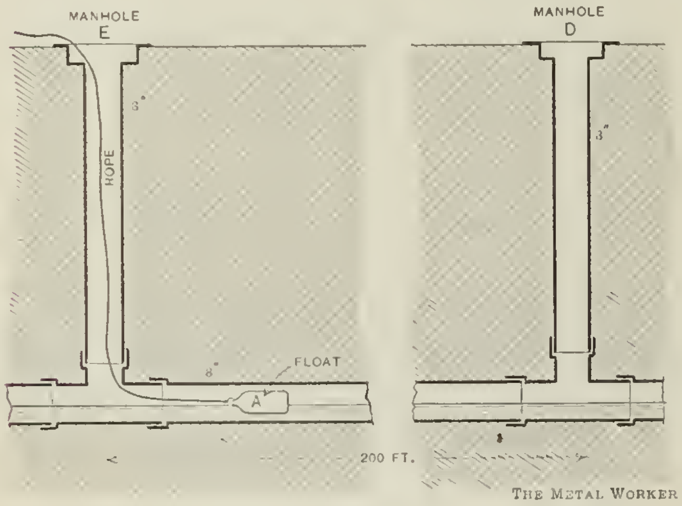
There are numerous cities throughout the country in which the majority of the streets or avenues are reserved for private residences, and where the rain water leaders of the residences cannot be connected to the house drain, for the reason that the sewer in the street would be too small to carry off both the rain water and the waste from the drain pipes of the residences. Since the rain water is not allowed to empty into the sewers to help in keeping them flushed, some other method must be adopted. The lateral sewers are quite often not larger than 8 inches in diameter and are made of salt glazed terra cotta pipe.

FLUSHING SEWERS.

In places where a good fall can be given the pipe and where there is an abundant water supply, the fire hydrant can be used to flush the sewer by connecting a line of fire hose to a hydrant convenient to a manhole situated at a high point on the line of sewer. The other end of the fire hose is lowered down the manhole and shoved well into the pipe. The water is gradually turned on until the full head of water rushes into the sewer, thus washing away all deposits which may have accumulated in the pipe. It not only helps to flush the sewer but also blows out the water main occasionally.

AUTOMATIC FLUSH TANKS.

Should the grade of the sewer not be so rapid and possibly the water supply not so abundant, automatic contrivances must be used for flushing, such as automatic flush tanks. These tanks must be constructed at a high point on the line of sewer and they are usually made of brick cemented inside and outside to make them water tight. They ordinarily have a capacity of about 200 gallons of water, but can be made to hold more or less, according to the needs of the sewer. A tank can be so regulated that it will discharge its full contents into the sewer at least once in every 24 hours, or twice, if deemed necessary, by allowing a stream of water to constantly flow into this tank from the water main through a pipe on which is placed a regulating cock to control the supply of water to the requirements of the tank.



Flushing and Cleaning Small Terra Cotta Sewers.—Fig. 1.—Floating a Line Down to Draw Cleaner.

THE ACTION OF TANK SIPHON.

This tank must be below frost and have a suitable cover perforated so that air can be admitted and also expelled, and it is discharged by means of a siphon. Different devices are used to make the siphon work; but as all siphons consist of a short and long leg it may be annular in form, or of the return pattern. The short leg reaches very nearly to the bottom of the tank, with the long leg extending down to a tilting device, or else a weir-like contrivance, which, in turn, must empty directly into the sewer. The bottom of the long leg must be sealed at the beginning of the discharge and unsealed at the conclusion. As the water rises up in the tank it expels the air which is in the short leg until it starts to fall down in the long leg, thus sealing the bottom of the pipe for about 1 inch in depth. As the water drops down it carries the air with it until a partial vacuum is secured, when the siphon will begin to work. The tilting tank will then drop and remain so until the siphonage is complete, when air will rush in, the tilting tank drop back into position and the tank proper be restored to its normal condition. On the other hand the weir will be siphoned out through a pipe specially arranged for this purpose, also restoring an equilibrium. Sewers which are cleansed by this method can never become foul, and in consequence the intercepting trap can be dispensed with.

A SCOURING FLUSH.

To thoroughly cleanse or flush a sewer, it should be filled with water its entire length, if it is possible to do so, so that the higher as well as the lower part would be full. It would draw in fresh air in proportion to the amount of water held in check, and upon its sudden discharge would ventilate the sewer. But should the topography of the locality not permit of a good fall being given to the sewer pipe, on account of the land being of a flat or nearly level nature and where none of the former methods could be used to advantage, then cleaners must be relied on to keep the sewers free from filth.

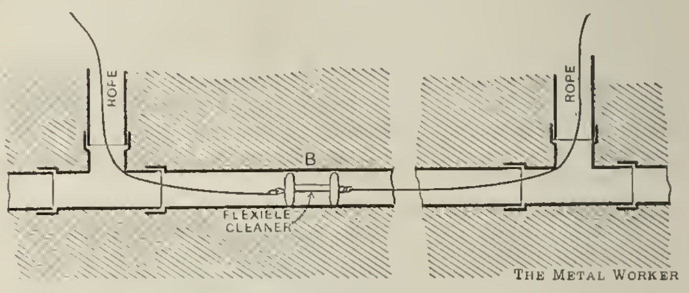


Fig. 2.—Flexible Cleaner in Use.

MECHANICAL CLEANING.

At every 100 or 200 feet a manhole or access hole is constructed to permit of a line being dropped down in the sewer on the end of which is a float. This floats with the current until it reaches the next manhole. It is then caught and a stronger line is drawn through, on which a cleaner is firmly secured. This cleaner is the full size of the pipe. It is pliable, as if it were too rigid it would be apt to get wedged and cause endless trouble. As this cleaner is pulled through it holds back the water in the sewer until the pipe is full. It is then suddenly pulled out at the lower end. It scrapes off all the grease or other filthy matter which adheres to the pipe, which the water will wash away. Anything which will not float away is caught and brought up to the surface.

I present a sketch which I hope will explain how the operation is performed. This is continued from manhole to manhole until the entire line of sewer is cleaned, and so on from street to street, by men who are constantly employed for this class of work. In Fig. 1 is shown the line with float, and at B is the flexible cleaner. E is the upper manhole and D the lower one.

SIZE OF THE HOUSE DRAIN.

The house drain may be 4, 5 or 6 inches in diameter, as the case may be; but it is argued by eminent engineers that a pipe 4 inches in diameter is fully capable of carrying off the sewage from the majority of private houses. As nothing but the liquid or semiliquid waste is supposed to pass through those house drains, it will have a better chance to cleanse itself, from the fact that the fuller this pipe will run at every discharge the better chance it has to flush itself. Some of the houses may be located as far back as 50 feet from the sidewalk line, which would require a long stretch of pipe in order to connect the house with the sewer.

LOCATING THE HOUSE DRAIN.

The following method is used in some cities to determine the course in which this house pipe was laid so as to locate it in case that there should ever be an obstruction in it: A lamp hole is placed on the pipe on a direct line with the pipe coming through the front wall and usually about 1 foot inside the property line at the front. It consists of a tee placed in the line of pipe with the side connection facing upward. The pipe is extended vertically up to the surface of the ground and the top finished with a suitable cover. When there is an obstruction this cover can be removed, and should the obstruction be in the street water will stand well up in this pipe. If not, then the obstruction is nearer to the house.

REMOVING AN OBSTRUCTION.

If there are no provisions in the house to permit the rodding of the drain and should the pipe be underground, the lamp hole or guide pipe will enable the plumber to know where to dig. The pipe can then be tapped and cleaned. If the obstruction is in the street the lamp hole will serve as a guide for digging down to the sewer so that it can be rodded, providing there are no broken pipes. The pipe between the house and the lamp hole could also be rodded out if it were found necessary to do so. Such a system of marking the drain saves useless digging, saves the lawn from being destroyed and is always a sure indication as to how the pipe has been laid.

DISPOSING OF SURFACE WATER.

The rain water leaders must be carried out to the curb stone in a separate pipe a little way under ground, a hole being cut in the curb stone to allow the rain water to flow into the gutter, or else it may be allowed to flow out on the surface of the ground and get away as best it can, tne gutter being graded to a storm inlet. This inlet may empty into the same sewer in which the lateral sewers also empty, or else into a separate pipe which would be constructed for that purpose. Very often the street can be graded to an adjacent stream. When this is possible all storm water can be allowed to flow away by this means.

At another time I will speak about connecting to large sewers.

Acetylene Generators in England.

Some time ago a committee was appointed by the British Parliament to inquire into the whole subject of acetylene generators. The report of this committee has just been issued, and from it we give the following quotation for the information of those of our readers who are interested in the subject:

> A large proportion of the generators examined belong to the automatic class. In these the object is the gradual generation of the gas as used, whereas in the non-automatic types the whole of the gas which can be generated from a given charge of carbide is evolved in a short time, and a gas holder has to be provided large enough to contain it. The contention is that the generation of the gas as used and the absence of a large gas holder are advantageous or convenient. When all goes well this may be so, inasmuch as under the skilled supervision and favorable conditions of the tests made by us serious difficulties did not arise, and in general the apparatus worked well. We are not satisfied, however, that under the varied conditions of use, especially with unskilled labor, this would always be the case, and we do not think that the advantages aimed at by the designers of automatic apparatus are sufficient to make it worth while to incur the possible trouble which we fear may be met with in the practical use of automatic generators, especially those of complicated design. In certain circumstances, with due safeguards, the employment of automatic generators may be admittedly convenient.
>
> We think it right to point out that, while the generators have in no instance shown evidence of being otherwise than safe under the conditions of the test to which we have subjected them, many are, in our opinion, of unnecessarily and undesirably complicated design, and some are not sufficiently strong in construction. On the whole, having regard to the conditions of use which must often prevail, we consider that in the selection of an acetylene generator regard should be had to the following desiderata: 1, Simplicity of action and design; 2, strength of construction; 3, high efficiency, as indicated by the yield of gas per pound of carbide; 4, low pressure in generator, and, 5, facility of removal of the residue.

CHILD'S PORTABLE FOLDING COT.

BY MARTIN L. KAISER.

The child's portable folding cot shown in Fig. 1 is formed of ⅜-inch gas pipe and fittings, and is so simple to make as to hardly require a description of the construction. The two rectangular frames formed by the elevated side rails and the rails to which the canvas is stitched are put together without unions, by means of a long thread. The distance from A to B in Fig. 2 should be greater than the distance from B to D, so that the base from A to E shall be greater than the spread of the canvas from C to D at whatever hight the cot is set.

A Child's Portable Folding Cot.—Fig. 1.—General View.

The canvas should be somewhat wider than enough to reach across the side bars when the cot is at the lowest position desired. One edge of the canvas should be securely stitched to one of the side bars, and the other edge stitched around a loose piece of ⅜-inch pipe of the same length as the side bar, with a cap on each end. This loose bar, with the canvas attached, is passed over and under the side bar of the cot, as shown in Fig. 3, and fastened at the desired position to each end of the opposite side bar by means of a strong cord or light strap. If only one predetermined hight is desired it is only necessary to stitch the canvas permanently to the two side bars. The frame work shown in Fig. 3 may be easily made in two hours, and old pipe and fittings may be used if desired. While the cot illustrated is for a child's use, by using different dimensions and larger pipe it may be suited to "children of a larger growth."

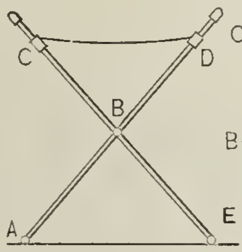

Fig. 2.—End View.

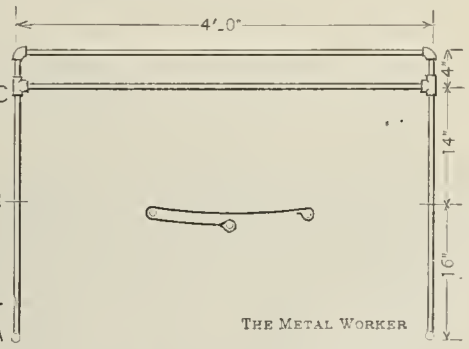

Fig. 3.—Side Frame and Canvas Bottom.

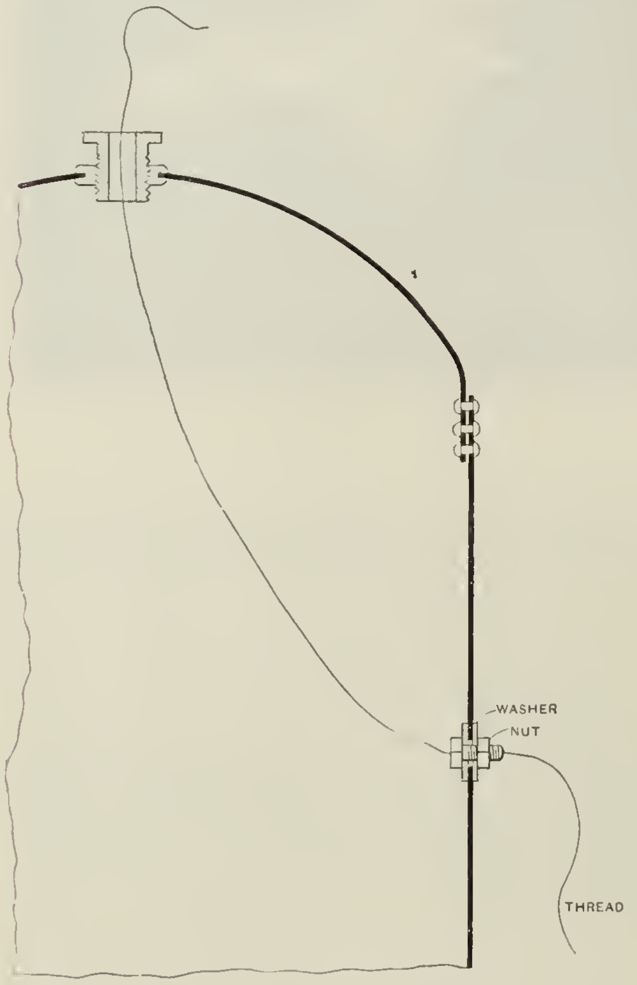
It may be noticed that to move the cot from one room to another it is only necessary to draw the two side bars together, folding the pillow and blankets within the canvas without otherwise disturbing them. Threaded acorn fittings may be used to finish off the foot pieces, or round ball foot pieces may be made of hard wood and the shank driven into the bore of the pipe.

REPAIRING A RANGE BOILER.

BY D. F. N.

Some of the readers of *The Metal Worker* will doubtless be interested in the method of repairing a range boiler resorted to by a man who did not wish to incur the outlay for a new boiler when the old one had begun to leak. The boiler was made of galvanized iron and the shell was too thin to permit of the use of a drift punch to make an opening to be tapped so as to be stopped by means of a screw plug. In the first place, as the owner was somewhat handy, he emptied the boiler and soldered up the hole, but this did not last more than a few days after the boiler became hot, and it began to leak again. He then employed a plumber to fix up the boiler so that it would stand until he could afford to have the old boiler replaced by a new one. The plumber removed the old solder and cleaned off the boiler, making a perfectly round hole, where it leaked, large enough to take a ¼-inch bolt with a soft copper washer on the inside. The bolt and the washer were secured together and dropped into the boiler through the hot water opening at the top, a piece of thread being tied to each end of the bolt. It was a simple matter to insert a wire through the hole and catch the thread upon the lower end of the bolt. The bolt was then drawn through the hole and another soft copper washer placed on the outside. A cement composed of litharge and glycerine was worked into the hole between the inside of the boiler shell and the washer. Some of the same cement was put on the outside of the boiler shell under the washer. When enough cement was put on the washers were drawn up tight against the shell by the tightening of the nut. When the cement had hardened it not only made a perfectly tight job, but also one that has stood for a considerable time. This method has been found serviceable for stopping holes in iron tanks, pipes and other places, where replacing the material would have caused considerable expense. It has proved its efficiency where the material is not thick enough to be drilled and tapped to be filled with a plug. The same method can be adopted for stopping sand holes in thin castings.



THE METAL WORKER

Repairing a Range Boiler.

The Model Heating Company in New York.

The steam and hot water heating trade are receiving notice from the Model Heating Company of Philadelphia that their New York branch has been removed to 88 Centre street, where they have a fine showroom, in charge of Percival H. Seward. The announcement is in the form of a four-page circular, one page of which is a map of New York showing the location of the concern. Another page gives instructions how to reach their office, while on the last page is a view of the building, so that it will be recognized on approach. On entering a most attractive display of boilers and radiators and other appliances for heating contractors is presented. The showroom is exceptionally well lighted from both front and rear, and the display of the Model sectional boilers, Dwarf tank heaters, Tobasco tank heaters and hot water storage tanks and all hights of the Acme and Corinth steam and hot water radiators is so arranged that the goods can be examined from all sides and the best advantage. The boilers are decorated in aluminum bronze with the relief parts in jet black. The radiators are finished in gold and various shades of bronze, and the Tobasco heaters and tanks are finished in jet black with maroon japan relief. All of the samples are set on marble slabs on the floor, which is covered with linoleum, the center aisle being covered with a handsome carpet. The effect, as a whole, is both striking and pleasing, from its cleanliness and brilliancy. At the front of the showroom a desk is provided for visitors, while the office staff are comfortably quartered at the rear, adjoining the private office of Mr. Seward.

The company also have a warehouse at 82 and 84 Centre street, where they will carry a large stock, not only of boilers, radiators, valves, specialties, pipe and fittings, but of everything that is needed in the construction of an up to date heating apparatus. The warehouse is well arranged for convenience in handling goods in the various departments, and is connected by a telephone system with the office and salesroom. These changes were made for the purpose of affording the trade in the vicinity of New York the best possible facilities for securing not only the Model boilers, but everything that a heating contractor may need.

The product of the Kewanee Boiler Company, one of the largest producers of tubular boilers and fire box boilers, will also be handled in the East by the Model Heating Company, which arrangement will be found of great advantage to steam fitters having large contracts. The trade in the vicinity of New York are invited to call at 88 Centre street, which is within easy walking distance of the principal business sections of the city and convenient to all the railroad stations and ferries. One of the principal attractions on the showroom floor is the hot water heating apparatus for a ten-family apartment house, consisting of a Model sectional steel boiler, with a water front section for connecting with a hot water storage tank of 250 gallons capacity, for supplying hot water and heating the building in the winter season. The storage tank is also supplied with openings and connected with a tank heater designed for furnishing the different apartments with hot water during the summer season, when the steam boiler is not in use.

The Ideal Fitter.

The American Radiator Company, Chicago, have issued a new edition of their hand book for steam fitters, with prices effective April 1. This book in its previous editions proved very popular in the steam fitting trade and the new and revised edition is expected to be even more acceptable. Although it is of pocket size, the contents are comprehensive, and the book is not a mere pamphlet, as it contains 86 pages. It gives illustrations of the company's full line of steam and hot water boilers, with complete price-lists, and also furnishes price-lists of radiation together with illustrations and price-lists of fitters' supplies, such as valves, floor and ceiling plates, pipe hangers, and expansion and storage tanks. A complete telegraph code is a valuable feature of the book.

Radiation for Residences.

Appreciating the value to the trade of some method for calculating the amount of steam or hot water radiation needed for a dwelling, James A. Harding, Sharon, Mass., has distributed to the trade cards bearing the following formulæ:

FORMULÆ FOR DWELLINGS.

A = Glass surface. B = Wall surface.
C = Cubic contents. X = Direct radiating surface.

Hall, first story, $X = A + \frac{B}{4} + \frac{C3}{55} \times G.$

Room first story, $X = A + \frac{B}{4} + \frac{C2}{55} \times G.$

Room second and third story, $X = A + \frac{B}{4} + \frac{C}{55} \times G.$

Add 10 per cent to results for north and west exposures.
Indirect steam radiation, = X + 25 per cent.
Indirect hot water radiation, = X + 50 per cent.
Catalogue boiler rating for steam, = X + 25 per cent.
Catalogue boiler rating for hot water, = X + 20 per cent.
Catalogue boiler rating for indirect, = X + 75 per cent.

Temperatures.			Hot			
Out doors.	Of room.	Steam. G.	water. G.	Size of mains.*	Steam.	Water.
				1 inch.	50	50
—10°	75°	0.32	0.56	1¼ inches.	100	100
0°	75°	0.28	0.49	1½ inches.	250	150
10°	75°	0.24	0.43	2 inches.	425	300
—10°	70°	0.29	0.50	2½ inches.	600	600
0°	70°	0.25	0.43	3 inches.	950	800
10°	70°	0.22	0.37	3½ inches.	1,250	1,100
—10°	65°	0.26	0.44	4 inches.	1,600	1,500
0°	65°	0.23	0.38	5 inches.	2,500	2,500
10°	65°	0.20	0.32	6 inches.	3,600	4,000

Vertical Pipes One Size Smaller.—If condensation drips back into steam main and water and steam flow in same direction use one size larger main, and if water and steam flow in opposite directions two sizes larger main.

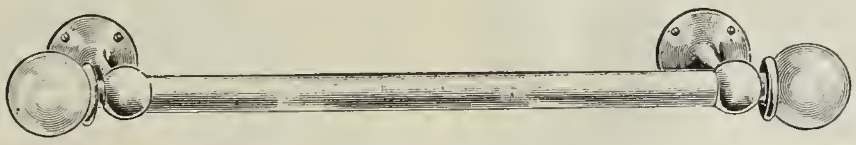
---

* For indirect, one-half larger.

Mr. Harding is the engineer and general representative for Eastern New England of the Boynton Furnace Company of 207 and 209 Water street, New York, and has his office at his residence, at Sharon, Mass. The card is in the form of a desk blotter and bears a cut of a Boynton vertical sectional steam boiler.

Towel Rack with Glass Balls and Bar.

The Searls Mfg. Company, Newark, N. J., represented in New York by Frederic Klages, 127 Duane street, have recently put on the market a towel rack with glass bar and glass balls at the ends, as here illustrated. The rack is made in three sizes, 24, 30 and 36 inches long, extending 3¼ inches from the wall. The glass balls are 2¼ inches in diameter, the annealed glass portions contrasting handsomely with the nickeled brass sockets. It is the intention later to bring out a line of similar racks with ornamental glass balls instead of the plain surface, as here shown.



Towel Rack with Bar and Balls of Glass.

Apprenticeship and Technical Instruction.

For many years it has been recognized, says the *Decorators' Gazette and Plumbers' Review*, London, that the apprenticeship system has been gradually dying out, with the result that young men are not having the opportunities for learning their trade which the apprenticeship system afforded. This, at any rate, is the popular idea, and on it is based the assertion that mechanics generally are not so skillful as they were years ago when every lad was compelled to serve his master for a term of years in order to gain a thorough knowledge of his trade. But it is not always that the popular view of these matters is the right one, and in this particular case, more especially as it applies to plumbers, there is a large amount of error combined with a very little truth.

If it is true, and this is not disputed, that the apprenticeship system is falling into disuse, there must be some cause for it, and when inquiries are made it will be found that in nearly 75 per cent. of the cases the apprenticeship system has had just the reverse effect to that intended and expected. For it will be found that young men who have been bound to a (so-called) master plumber have been engaged during most of their time in work which cannot by any stretch of imagination be called plumbers' work, with the result that at the end of the five or seven years' term they are not much nearer becoming plumbers than they were at the start. While others who have not bound themselves as apprentices have been free to stay or leave any particular firm and choose for themselves where they shall learn the trade which they have decided to master. One is not advocating the rolling stone style of picking up a trade, because it is open to many abuses which need not be enumerated here, but this view which many take of the matter no doubt accounts for much of the dissatisfaction which exists with regard to the apprenticeship system.

Young apprentices can see their fellows who are able to give up the work at one firm and go to another where the work is of a much superior class, and of a more extensive character, and although the free man is not supposed to have the same facilities and privileges as the apprentice, so far as the learning of the principles and practice of the trade is concerned, it does not depend so much on the master as on the young man himself, and his determination to make the best of his opportunities whenever they present themselves to him, and in this way many have become really good mechanics.

Nevertheless, there are several reasons why the apprenticeship system should be retained, and, if possible, made more extensive. Anything, therefore, that is calculated to bring the system more into favor will be welcomed by all those interested in the plumbing trade. With this object in view the Plumbers' Apprenticeship Board, which is composed of representatives of the London Society of Associated Master Plumbers, the United Operative Plumbers' Association of Great Britain and Ireland, and the Plumbers' Company, have prepared a new up to date apprenticeship indenture, which, in addition to the usual provisions, states that he "shall attend and diligently study at the evening classes of any technical institution or trade school now or hereafter to be established in—— as his said master shall direct, and as shall be approved by the Plumbers' Apprenticeship Board, and shall once in every year of the said term, after the first year thereof, submit himself for examination in technical knowledge of the said trade of a plumber, and of the said art of sanitary plumbing, &c." Now that the technical education movement has made such an arrangement possible in most towns of any importance, it will, of course, give young men who have not the privilege of seeing the best of work in the shops in which they are apprenticed the opportunity of acquiring much more practical and technical knowledge than was possible under the old system. As a matter of fact many masters, to their credit, have for some time been sending their apprentices to the plumbing classes, and have in many cases been paying the fees for them.

We think that a clause to this effect in the indenture would be an improvement, considering the small amount of wages apprentices receive during their term of service.

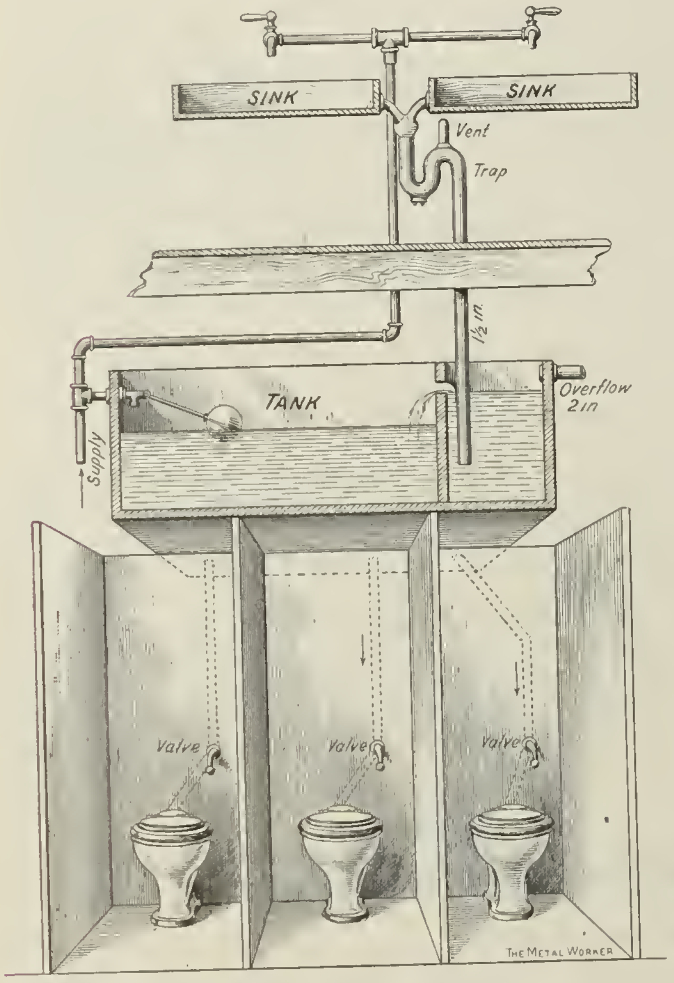
W. A. T. Smith, New Haven, Conn., agent for the Kelsey Warm Air Generator, is installing two batteries of No. 24 Kelsey Generators in the new City Mission Building. He is also installing a battery of two large Heaters in the residence of Lewis S. Welch.

DIRECT FLUSHING CLOSETS.

BY H. M.

Direct flushing valves for water closets are designed to avoid the use of individual tanks. They have been more favored by the trade and the public during the past three or four years than at any former period; but the idea is not new. They are admirably adapted for use on vessels and are economical in buildings when circumstances are favorable. The valve is generally termed an "'ometer," with whatever prefix the inventor or manufacturer may fancy to make a trade name and to distinguish it from the other 'ometers on the market.

The direct flushing valve, no doubt, is an evolution from the practice of the old time plumber in locating his house tank in the attic, so as to flush the closet by pulling a chain attached to a cistern valve in the bottom of the tank, and of course the less turns in the pipe and the fewer the pulleys on the chain the better it worked. So, when convenient, the tank was placed over the closet. Sometimes the plumber was bold enough to pipe direct to the closet and put a lever handle stop cock in the flush above the closet seat. The writer has seen a steam whistle valve so used, a chain and pull being attached to the lever of the valve.



Direct Flushing Closets.—Fig. 1.—An Early Method of Direct Flushing.

Fig. 1 illustrates the first genuine direct flushing job known to the writer. It was in an economical landlord's apartment house. A photograph gallery used more water than all the other tenants combined, and being on the top floor the landlord himself conceived the idea of flushing the closets on the lower floors with the practically clean water from the print-washing sinks of the gallery. The plumber put an oblong tank over the closets, arranged a settling chamber at one end of the tank and piped the waste of the sinks into the settling chamber, from which the water overflowed through a fan seal into the main tank. All the closets were connected with the main tank by separate flush pipes, each being fitted with a Carr closet valve with full size couplings. The spindle ends of the valves were fitted through the marble and the spindles fitted with levers riding on the caps like the ordinary telegraph cock. To flush the closet it was only necessary to push the lever, the length of flush being adjustable by the side screw, as usual. The waste water was supplemented by the regular house supply, being connected to a ball cock in the tank, as shown.

Some of the flushing valves on the market are elaborate, but any plumber familiar with the principles of the common Carr valve, having either a groove in the barrel or a passage controlled by a screw to let the water pass from behind a cup leather, will have no trouble in handling the direct flushing valves.

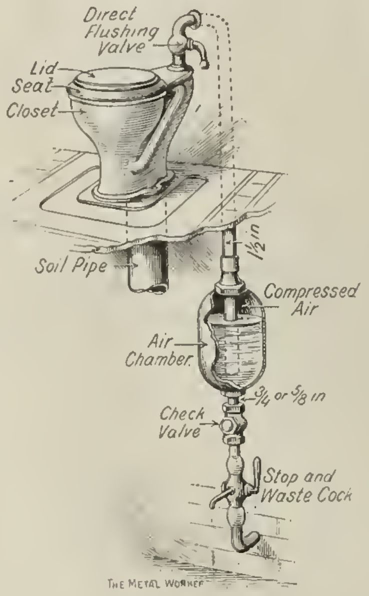


Fig. 2.—A Direct Flush Pipe with Air Chamber.

Some of the advantages of the direct system are: No individual tanks are necessary, which is economical on a large job; the closets may be set under windows or stairways; the numerous flush pipes, supplies, ball cocks and general accessories are not needed; the annoyance from leaking tank linings is avoided; and, on the whole, the job looks better. The disadvantages are that unless the water pressure is excellent an overhead tank is necessary, and the manufacturer usually demands that nothing less than a 1½-inch service be used. A 1½-inch service for a residence or ordinary job is out of the question. Most water companies could not be induced to put in such a service for a small job, and if such was provided the continuation of it would be too expensive to justify installing one or two closets.

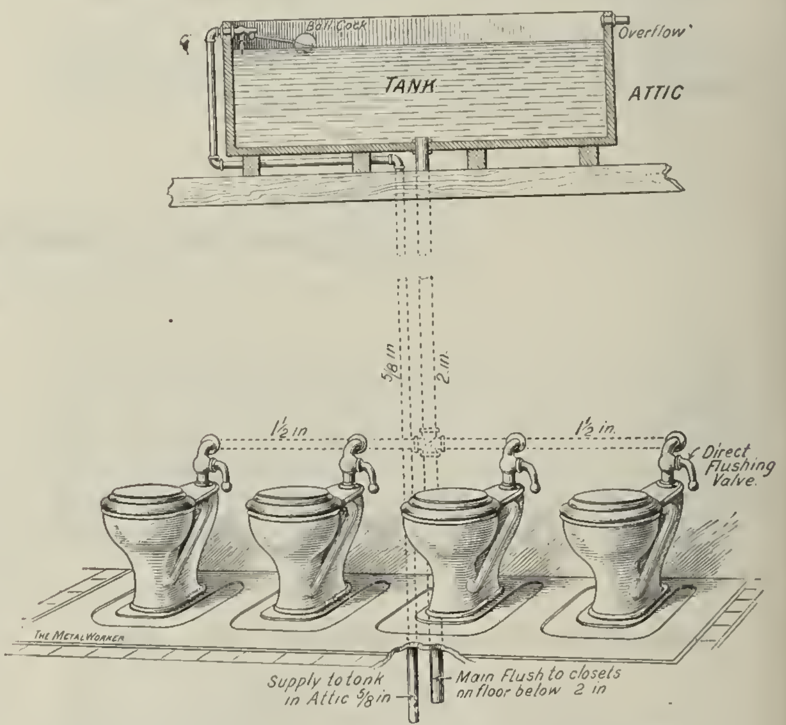

Fig. 3.—A Battery of Closets Flushed from Attic Tank.

The direct flushing closet, as now sold, is not cheaper than the individual tank closet; the actual service is no better, and with a single tank to supply a number of closets, fed by a single line of supply pipe and the closets flushed through or from one general flushing main, the failure of any part of the system except a closet, valve or branch pipe would interfere with the use of all the closets. For this reason it is good practice to put stop valves on branch pipes, and where there are several batteries of closets, or one battery and several single installations, it is best to have at least two flushing mains, controlled by stop valves.

Fig. 2 represents a single closet flushed direct from the ⅞-inch street service. The check valve above the stop and waste cock is to hold the water so as to get the full benefit from the compressed air in the chamber at all times. The closet flush pipe is 1½-inch and is extended nearly to the bottom of the chamber. Two closets would work on the same flush pipe with only one air chamber, and even more if the chamber is made large enough, say 12 x 18 inches for four or six closets, instead of 9 x 12 for one or two. It is not safe, as a rule, to let a battery of closets depend on an air chamber but one or two in a residence or store office work well. There should be at least 10 or 12 pounds effective pressure at the closet level, even when the service is 1½-inch throughout. With small service and air chamber the pressure should be at least 30 pounds. Air tight closet tanks and small range reservoirs or boilers answer well for air chambers on this kind of work. It is not necessary to follow the sketches literally, but the principles must be adhered to, however the connections are made.

Fig. 3 shows a battery of four closets with all essential connections.

The direct flushing system is better adapted for large work than for small jobs, and will probably never be seriously considered in competition with individual tank closets for single installations. The plumber should exercise the same common sense regarding them that he would in any other line of work, and while poor judgment or mistaken ideas or overzealous effort to be up to date will certainly be responsible for many jobs of the kind, unsatisfactory for the mere reason that the conditions rather than the system are at fault, the trade will soon learn to discriminate and the direct flushing closets will find their way into only such jobs as will bring their good points into evidence.

Howard & Morse.

On April 1 David R. Morse and his son, Frederick R. Morse, retired from the firm of Howard & Morse, 45 Fulton street, New York City, whose salesrooms have been continuously located for 40 years on that street. The business, that of the manufacture of wire cloth and wire work in manifold forms, was founded by the late John W. Howard in a basement in the same street in 1852. In 1862 John W. Howard formed a copartnership with David R. Morse, who had been employed by the De Witt Wire Cloth Company, and this continued until his death in 1892, his sons, Edward S. Howard and William B. Howard, as well as Frederick R. Morse, a son of the junior member, having in 1890 entered the firm. In 1883 they adopted the manufacture, sale and application of the Blackman power ventilator to industrial establishments and public buildings. With the erection of those of huge dimensions a new field was opened and quickly occupied, the firm's enterprise inspiring the formation of an engineer and construction corps for the scientific ventilation of the properties. In such application they have been eminently successful, and have now contracts, among many others, for the execution of such work for the new Hall of Records, new Astor Hotel, Hotel Martinique, Chamber of Commerce, Mount Sinai Hospital, Young Men's Christian Association, Hanover Bank and Hotel Essex, all of which are elaborate in details. Edward S. Howard and William B. Howard having purchased all rights, title and interests of the retiring partners, have decided to conduct the business under the old firm name, and with facilities to increase its output.

Al. J. Potts & Co., St. Peter, Minn., were awarded the $4000 contract for installing the heating plant and doing the plumbing in the new Roman Catholic Church at Sleepy Eye.

Education of Plumbers in Relation to Public Health.*

BY GEO. VINCENT.

Technical education enables the artisan to produce work which gives comfort or enjoyment to the users or beholders. The finished work of an artist is a combination of form and color, which gives intense pleasure to the artistic mind. The finished work of a carpenter satisfies the eye, while accommodating the whole body. The combined work of the architect (designer or artist) and the constructive tradesmen (mason bricklayer and carpenter) produce our comfortable modern homes. The additional assistance of the plasterer, painter, &c., renders those homes beautiful and artistic.

There is something, however, still lacking in the home to make it habitable—viz., an abundant supply of pure water and an efficient system of removing all offensive materials—liquid and solid. The removal of the waste and foul matters to the street sewers brings with it a great danger, that of entrance into the dwelling of the foul and germ laden gases of the sewer. Upon the plumber devolves the duty of securing the one while preventing the other. The faulty work of other tradesmen may do little harm should it escape detection, but the faulty work of the plumber, hidden and unobserved, may carry disease and death. Disease from insanitary conditions often baffles the most skilled doctor. The cause of the disease was improper plumbing work, and the effect frequently death. To prevent a further effect from the same cause the plumber is called in, the defective work is removed and replaced by sanitary drainage.

To save life and prevent disease is the duty and privilege of the plumber, an estimation of his place which found eloquent expression by Sir James Graham, Mayor of Sydney, in welcoming the convention. The worthy Mayor is not alone in his public appreciation of the importance of good plumbing. Dr. Yarnold, the eminent English expert, in his official report on the smallpox epidemic, states: "The doctor will find his skill and medicine of little avail if the patients are to live in ill drained and ill ventilated houses." Another eminent British authority says: "The public demands from the plumbing craft an intelligent knowledge of the best and safest methods for the expeditious removal of decomposing products, and for efficient prevention of their return into the dwelling." These quotations are sufficient to show the high appreciation of the services of the plumbing craft held by the medical profession.

It is simpler, cheaper and more prudent to prevent than to cure. When will the public and governing bodies properly appreciate this fact?

The plumber is misunderstood, his work depreciated and the public therefore consider his profits excessively large. Where are the army of plumbers who have retired in affluence? They exist only in the imagination of those who write books and make jokes. The actual master plumber has but a very poor return for the capital and experience which his business demands.

It is the duty of plumbers to keep pace with every new development of sanitary science. Sanitation is a progressive science. Methods considered scientific and correct ten years ago are to-day discarded as obsolete and incorrect. Education is the greatest need of the plumbing trade. This twentieth century will transform the plumber from an artisan to a scientist. It should be as impossible for a plumber to carry on his business without proving his qualifications as it would be for a physician to attempt to heal disease without a diploma. It is a crime chargeable to the Parliament of a country when an inefficient system of licensing is in vogue and when no house to house inspection is insisted upon.

The system of licensing of plumbers is a disgrace to the city of Melbourne, and it is an imperative duty of the Parliament of Victoria to compel those carrying on the business of plumbing to prove their fitness by passing at least a similar examination to that insisted on in this city of Sydney.

It is not enough that a plumber should have sufficient skill to connect different pipes together, make the joints water tight, and leave his work finished in a neat and trim manner. A system of plumbing, perfect in handicraft, may be dangerously defective in planning and arrangement. To place the entire onus of responsibility upon an inspector to detect all such defects is imprudent and dangerous. Public opinion rightly places this responsibility upon the plumber. Close supervision, inspection and testing of all sanitary plumbing work is necessary. No safeguard should be omitted. The public should be guarded against unscrupulous and irresponsible people who exploit an important business for gain and profit. There are incompetent master plumbers just as there are incompetent physicians; the greater need, therefore, for legislation in order to protect the public.

---

* Paper read before the National Master Plumbers' Convention, Sydney, N. S. W., 1901.

The position claimed for the plumber in this paper demands the possession of educational qualifications; not education in all its branches, but that knowledge which will enable him to design wholesome and economical plumbing systems, based on the principle of sanitary science; to direct his workmen in every detail; to set out and lay out all the work, so that no workman need deviate from his instructions.

Plumbing being, however, an ever progressive science, we must look to the boys of to-day, who will become the men of to-morrow, to raise the status of the trade. Modern business methods preclude the possibility of any boy properly learning the intricate business of plumbing during working hours in the workshop. He has theory as well as practice to acquire. With the practical side he becomes familiar, daily assisting competent men, and getting to know the tools and their uses. He has, however, only limited opportunities of gaining skill in the use of tools and the treatment of materials. Handicapped as he thus is in the gaining of practical skill, he is even more disadvantageously placed in gaining theoretical knowledge. This side of our trade is too often overlooked and misunderstood. "An ounce of practice is worth a ton of theory" is a very misleading proverb. Is not theory a statement of something which has been proven by the experience of some other men?

Technical schools are an actual necessity as an adjunct to the workshop, and Sydney is to be congratulated in possessing so splendid an institution as the Technical College at Ultimo, where a complete study of the practice and theory of plumbing is pursued under the most favorable conditions.

It is a matter of regret that the Technical College of Melbourne (the Working Men's College) has not given to sanitation the same prominence as the Sydney institution. The practical class has been since its inception in competent hands and useful instruction has always been given. The benefits of this class, however, have been taken advantage of by a very large number of people who had no right to be there—men preparing to pass the examinations necessary to secure the certificate of the Melbourne and Metropolitan Board of Works. In this way the class, through no fault of its own, has been made a factory for half taught plumbers. While affording full means for acquiring the handicraft, its value has been depreciated by the open method of admitting students who were not, and never had been, associated with any plumbing shop for the purpose of learning the trade. It must be admitted, however, that the handicraft of the trade has been taught in the Melbourne college by a competent instructor ever since its inception. But it is a regrettable fact that instruction in the theory of plumbing has been almost entirely neglected. The attention of the college authorities has been called to this neglect, a neglect which has been made apparent by the absolute incapacity of the students to answer the simple questions forming the theory paper at the annual examination held by the Education Department. The responsible position of a master plumber makes it imperative that a thorough knowledge of the theory of plumbing should be imparted. Yet these students, who are to become the future masters, are without the necessary tuition. The establishment of a sanitation department on the same lines as in Sydney should be insisted on, and the control of the department given to a competent practical man capable of instructing the students in the theory and principles of this important science. Personal effort on the part of master plumbers is also necessary, and this can be best put forth by assisting in every way the education of apprentices and assistants, and by visiting at regular intervals the Technical College, so as to increase the efficiency of these institutions.

The organization and reforms necessary for the proper education of plumbers may be tabulated as follows:

1. A uniform and efficient system of apprenticeship, providing for compulsory attendance at a technical college.

2. Reorganization, where necessary, of all technical colleges and trade schools, so that they may become true adjuncts of the workshop, limiting the students to apprentices engaged in learning the trade; such schools to be so equipped that every facility and appliance is provided for the proper and adequate course of instruction in the handicraft and theory of domestic sanitation and drainage, as well as the other branches of the trade.

With every plumber possessing such experience and knowledge of sanitation, the natural legislation that should, and doubtless would, follow would be the compulsory licensing or registration of every person who wished to carry on the business of plumbing. The diploma necessary to secure licensing or registration should be only attainable by those who have successfully passed through the course of instruction in the handicraft and theory of sanitary science in the technical college.

May the time soon come when the National Association of Master Plumbers of Australia will take rank with other professional associations, and when all its members, by an exposition of their skill and knowledge, have justified their possession of a diploma which entitles them to engage in the important business of plumbing; our annual conventions will then become noteworthy gatherings, the public looking to them to furnish the latest practical developments in sanitary science.

Washington Plumbing Regulations.

Colonel John Biddle, the Engineer Commissioner of Washington, D. C., says the *Star*, has recommended to the district board a number of amendments to the plumbing regulations in Sections 7 and 128, relating to gas fitting. The city solicitor recently held that the commissioners have authority for these amendments, the object of which is to allow the setting of gas stoves and the tapping of water pipes for steam fixtures in certain instances by others than registered plumbers. The stove dealers and steam fitters have long sought these amendments. The amendment proposed to Section 7 in regard to gas fitting is as follows:

That on application a general permit be given to each stove dealer to connect gas ranges or stoves with any gas supply system in accordance with the provisions of these regulations, provided that not more than 15 feet of pipe shall be laid or run in any one instance, and provided a suitable outlet has been inserted by a registered gas fitter for the purpose of making said connection, and upon the approval of the inspector of plumbing in each case that the supply pipe is of sufficient size. In every case where such outlet shall not have been provided it will be necessary to secure the services of a registered gas fitter to perform all necessary work to place the said gas range or stove in connection with the gas supply.

The proposed amendment to Section 128 in regard to steam fitting reads:

That hereafter any steam fitter who desires to engage in the erection of any heating apparatus requiring a connection with the water supply system may procure a permit to make the desired connection, provided that not more than 15 feet of pipe shall be laid or run in any one case, and provided a suitable outlet shall have been inserted by a registered plumber for the purpose of making said connection. In every case where such outlet shall not have been provided it will be necessary to secure the services of a registered plumber to perform all work required to furnish said heating apparatus with suitable connection to the water supply.

Ontario Master Plumbers.

A meeting of 30 of the principal master plumbers of the Province of Ontario, Canada, met in Pythias Hall, Toronto, on March 29, and formed the Provincial Plumbers' Association. A constitution and by-laws were adopted and the organization was perfected by the election of the following officers:

President, William Mansell, Toronto.

Vice-president, William Clarke, Hamilton.

Secretary, W. H. Meredith, Toronto.

Chairman of Legislation Committee, T. H. Wieland, Barrie.

Chairman of Sanitary Committee, A. Rogers, Hamilton.

Chairman of Apprenticeship Committee, Charles Taylor, Brantford.

Chairman of Essay Committee, R. Ross.

The next annual meeting will be held in Toronto on Thanksgiving Day.

PLUMBERS and steam fitters who are called upon to set large hot water storage tanks of from 150 to 1000 gallons capacity will be interested in a circular issued by Jacob F. Oberle, 780 Second avenue, New York, devoted to the Oberle Patent Supporting Fittings. They are made of cast iron in a variety of sizes and are threaded for wrought iron pipe. It is claimed that these Fittings not only afford a substantial support, but also save time and expense in setting up hot water storage tanks, whether vertical or horizontal.

Heating and Plumbing Notes.

The master plumbers of Duluth, Minn., are said to be opposed to the plumbing ordinance that is before the council of that city, claiming that it has provisions that will increase the cost of plumbing at least one-half. The ordinance provides for a plumbing inspector, which is also held to be an objectionable feature.

The Merrill Plumbing & Heating Company, Merrill, Wis., have moved their business to their own building at 1007 East Main street, where they make a fine display of Plumbing Fixtures.

The Board of Supervisors of the Almshouse at Schenectady, N. Y., will receive bids until April 15 for heating and ventilating the Almshouse Building.

The plant of the Homestead Valve Mfg. Company has been removed from Pittsburgh to Homestead, Pa., where the company have secured a much larger establishment and will be enabled to materially increase their output.

The Mansfield Plumbing Company, Passaic, N. J., have purchased a property on Washington place, which they will alter for use as a plumbing shop.

E. F. Rudderow, 120 Federal street, Camden, N. J., has recently completed the plumbing and drainage system in the extensive building in that city used by the American Cigar Company for factory purposes. Automatic self flushing closet ranges and long several-part lavatories are a part of the equipment of four different floors of the building.

The plant of the Tyler Tube & Pipe Company, Washington, Pa., will be considerably extended in the coming summer.

Jacob Dome has moved his plumbing shop to the corner of Duke and Philadelphia streets, York, Pa.

The Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass., are sending out an advance circular devoted to the Crawford Boiler for steam and hot water heating. This Boiler is made in five sizes of grates, from 20 to 32 inches in diameter. It is round in form, and the construction not only provides for a free circulation of the water, but also for the exposure of a large amount of heating surface.

In the District Court, sitting at Austin, Texas, several cases pending against the members of the Texas Master Plumbers' Association for penalties aggregating $44,000,000 for alleged violation of the anti-trust law were dismissed upon motion of District-Attorney Warren Moore, who instituted the suits. The suits were dismissed on the ground that the laws on which they were based are unconstitutional.

Charles W. Goger is about to build a three-story stone and brick store and plumbers' shop, 20 x 54 feet, to cost $3500, at the southwest corner of Twenty fourth street and Montgomery avenue, Philadelphia.

The journeymen steam fitters of Milwaukee, Wis., are elated over the result of an investigation concluded at Chicago a few days ago by President Gompers and a number of other labor leaders, in which they held that steam fitters were in the right in a controversy which had arisen with the plumbers over work to be done in buildings. The decision just made at Chicago is the second one made by the international officers in favor of the steam fitters on the question. It holds that the plumbers have no right to make any connections for the heating of buildings or similar wrought iron work, but that they must confine themselves to the attachment of bathtubs, water pipes, boilers, washbowls, &c., with water connections.

George Gaertner has been appointed plumbing inspector of Saginaw, Mich.

Oliver H. Stinson, senior member of the firm of Stinson, Kennedy & Co., plumbers, at 213 Wood street, Pittsburgh, Pa., was struck by a car on the Pittsburgh & Birmingham line on April 6. He sustained serious injuries, from which it is thought that he cannot recover.

Col. S. J. Fox, president of the National Pipe Bending Company, New Haven, Conn., is recovering from another operation made necessary by an injury to his leg many years ago. Colonel Fox has been a patient sufferer for years, but, notwithstanding, has been constantly active in business and public affairs.

"The Master Plumbers' Association of Worcester, Mass.," says the *Telegram* of that city, "threatens the city of Worcester, the Washburn & Moen department of the American Steel & Wire Company and a few other great big corporations. The city and the steel trust may start a plumbing supply factory of their own."

The Egleston Square Hardware & Plumbing Company, Timothy J. Hartnett, manager, formerly of 3117 Washington street, are now located in new quarters at 3105 Washington street, Egleston Square, Mass.

W. F. Rafferty, Dayville, Conn., has been awarded the contract for plumbing the new Bradley Building, in that city. Bundy Heaters are now being installed.

The Iowa Plumbing & Heating Company of Davenport, Iowa, have filed amendment to their articles increasing their capital stock from $5000 to $25,000.

A. H. Funke, 101 Duane street, New York, is distributing an illustrated catalogue of Baldwin Acetylene Lamps, for use in drifts, tunnels and mines of every sort, or wherever open flame Lamps can be used. These carbide burning Lamps not only give a brilliant light, but, it is claimed, are much more economical than candles.

The Vanderman Plumbing & Heating Company, Willimantic, Conn., have been running their foundry 11 hours a day in order to fill orders for Vanderman's Extension Soil Pipe Fittings and other Plumbing Specialties.

Herbert G. Candee, secretary of the Board of Education of Rochester, N. Y., will receive bids until April 25 for heating and ventilating the East High School Building in that city.

Adolph Weidmann, a well-known and very popular salesman of the National Tube Company, died on March 22 at Houston, Texas, of appendicitis, at the age of 34 years. He was born in Belleville, Ill., and at an early age entered the employ of the St. Louis branch of the National Tube Works, where he remained for about four years. About 12 years ago he went on the road as traveling salesman and had continued in that work with conspicuous success up to the time of his death. Mr. Weidmann's special field was in the Southwest, and he had been instrumental in securing some large contracts in the Texas oil fields.

O'Hara Brothers are fitting up a building on West Water street, Weir, Mass., for their plumbing business.

W. G. Backus & Sons, Pittsfield, Mass., have secured the contract for installing the plumbing work in the Burnham Industrial School at Canaan, N. Y.

S. E. Dibble, New Haven, Conn., will install the plumbing in the new house of A. W. Flint, to be erected in that city.

The Buckingham-Routh Company, New Haven, Conn., have the contract for installing the plumbing in the summer residence of Victor M. Tyler at Indian Neck, Conn.

P. J. Moran, Salt Lake City, Utah, bid $2400 and secured the contract from the Regents' University of Utah for plumbing and heating the new Physical Building.

Robert Scott, Philadelphia, Pa., will install a low pressure steam heating plant in the building of the Young Women's Boarding House Association, corner of Ninth and Pine streets, in that city, at a cost of about $1900.

The Mulford Heater Company, Galva, Ill., are sending out some new circulars in the interest of their Steam and Hot Water Boilers, calling attention to the fact that they are now using cast iron push nipple connections instead of asbestos gaskets. The circulars show the Boilers in such a manner that the fire and water travel can be readily understood. They are of the horizontal sectional type and are made in several sizes.

Cecil Graebe, Wheeling, W. Va., has the contract for plumbing St. Stephen's parsonage, in that city, and equipping it with a natural gas and illuminating gas lighting system.

Pierce & Cox of Boston, Mass., have completed the contract for installing a heating plant in the Town Hall at Warren, Mass.

The plumbers' strike at Seattle, Wash., has been settled.

The plumbers of Cedar Rapids, Iowa, have petitioned the City Council to create the office of plumbing inspector.

Francis J. Torrance of the Standard Mfg. Company, Pittsburgh, is being spoken of as a prospective Republican candidate for Governor of Pennsylvania.

Frank Davis, 404 Main street, Pawtucket, R. I., has been awarded the plumbing contract for the new W. W. Dunnell bleachery plant at Apponaug, R. I.

The Iowa Plumbing Company, Davenport, Iowa, have increased their capital stock from $5000 to $25,000.

The Reading Radiator Company, Reading, Pa., are building a 60 x 80 foot addition to their foundry. They are in the market for an apparatus for opening the ventilators at top of foundry that can be operated from the floor below.

The Jarecki Mfg. Company, Erie, Pa., are constantly shipping Steam Brass Work and Malleable Iron Fittings to London, England, and the Continent.

J. J. Ryan & Co., 68-74 West Monroe street, Chicago, brass founders and finishers and manufacturers of Plumbers' Brass Goods, report receiving contracts for Metal Trimmings for marble closets and urinal partitions and lavatory work for the following buildings: Auditorium Annex, Hoyt Building and Rookery Building, Chicago; Grand Opera House, Cincinnati; Peoria Hotel and Rock Island Depot, Peoria, Ill.

New Firms and Changes.

A letter from George W. Utton, Winsted, Conn., informs us that he has sold out the plumbing business which he has conducted in that place for the past 20 years to the new firm of Barrett & Kennedy, who will continue the business at the old stand. Both the members of the new firm have been associated with Mr. Utton for the past ten years.

The Spooner & Harris Company, 61 Worthington street, Springfield, Mass., inform us that a partnership has been formed between Myron B. Spooner and William A. Harris, both of Springfield, to manufacture and job Furnaces, Steam and Hot Water Heaters, Radiators, Steam, Water and Gas Supplies, Sheet Metals and Plumbing Specialties. Mr. Spooner is well known to the trade, having traveled for more than 13 years for the Boynton Furnace Company of New York. Mr. Harris has been engaged in the manufacturing business for more than 20 years, and was formerly secretary and manager of the Springfield Foundry Company and of the Baush & Harris Machine Tool Company of Brightwood. They desire to receive catalogues and quotations from manufacturers and dealers in goods in their line.

Donat Karle, Joseph Karle, William Adams, Charles Jorger, Henry Keelzer and J. A. Schultze of Detroit have filed articles of association of the Karle Company, Limited, for the purpose of conducting a plumbing business. The company are capitalized at $10,000, all but $1800 being in property.

A. Cuthbertson, formerly in the employ of J. C. Polson, has bought out his stock, and will carry on a plumbing and tinsmithing business at the old stand, 2 Division street, Holyoke, Mass.

The Water Heater Mfg. Company of Milwaukee, Wis., have increased their capital stock from $25,000 to $40,000.

The firm of McGuire & Horton, plumbers, at White Plains, N. Y., have been dissolved by mutual consent, Mr. Horton retiring.

The Gem City Plumbing & Heating Company have been incorporated at Dayton, Ohio, with a capital of $30,000, to conduct a plumbing and heating business.

The Gas Appliance Company of Baltimore, Md., have been incorporated, with a capital stock of $20,000, for the manufacture of Gas Appliances. Frank D. Moses of Trenton, N. J.; Harry W. Hunter, Edward Brady, William T. Porter and others are interested.

The New Hanover Plumbing Company have been incorporated at Wilmington, N. C., by Charles Elliot and A. Watkins, to do a general plumbing and tinning business. Their headquarters will be in the Smith Building on Princess street.

Walter H. Sewell, formerly in the employ of W. L. Snow, has opened a Plumbing, Furnace and Stove Repair shop at 59 Holland street, West Somerville, Mass.

The American Self-Heating Radiator Company, 529 Main street, East Orange, N. J., have been incorporated, with a capital of $125,000, by C. V. Childs, George T. Mills and H. N. Smith, to manufacture Radiators.

A. Malloy, for many years with the New Haven Steam Heating Company, is now associated with Lawrence Kling in the plumbing business, the firm being known as Kling & Malloy, New Haven, Conn.

The Seward Engineering Company, 89 Centre street, New York, who are well known to the heating trade, have been incorporated, with E. C. Seward as president; George H. Teft, secretary and treasurer, and J. H. Lee, superintendent. This company were established several years ago by Percival H. Seward, who has sold out his entire interest and severed his connection with the concern in order to become the manager of the New York office of the Model Heating Company.

The Durango Plumbing Company have been incorporated by Louis C. Jakway, Frank W. Stubbs and A. M. Jakway, with a capital of $10,000, at Denver, Col., to conduct a plumbing business.

The Detroit Ventilating Company, Limited, of Detroit, Mich., have filed amended articles of association, with a capital stock of $150,000, of which Albert Drouillard holds $40,000; Edmund I. Scully, $40,000; John M. Kay, $20,000, and Walter J. Scully, the chairman of the Board of Managers, $50,000.

J. C. Miller has opened a plumbing and tinsmithing shop at Caro, Mich. Mr. Miller is a regularly licensed plumber, and for several years has been in charge of the tin shop and plumbing department of the business of Lazelle Brothers.

W. H. Harroun and James Kenner, Jr., have entered into partnership and will conduct a plumbing business in the Jewell Building on Main street, Westfield, N. Y.

C. H. Avery, Nashua, N. H., advises us that the business of house furnishing, heating and plumbing heretofore conducted under his name has been incorporated and the firm will be known in future as the C. H. Avery Company. Hiram W. Brooks, George A. Davis and David Pinet, who have been with Mr. Avery many years, have been admitted to an interest in the concern. The business will be conducted as heretofore, with Hiram W. Brooks as manager of the plumbing and heating department.

B. L. Howard has purchased the stock of the Atlantic Stove & Plumbing Company at 94 Brewer street, Norfolk, Va.

Klentz & Busby are a new firm in the plumbing and heating business at 223 South Main street, Rockford, Ill., Paul Klentz, who has carried on a plumbing business for a number of years, having taken Mr. Busby into partnership with him.

George Scholl has opened a plumbing and tinsmithing shop at South Framingham, Mass.

The *Bulletin* of Williamsport, Pa., announces the incorporation of the Steel & Robinson Company, with a capital of $50,000, to manufacture Steam Radiators.

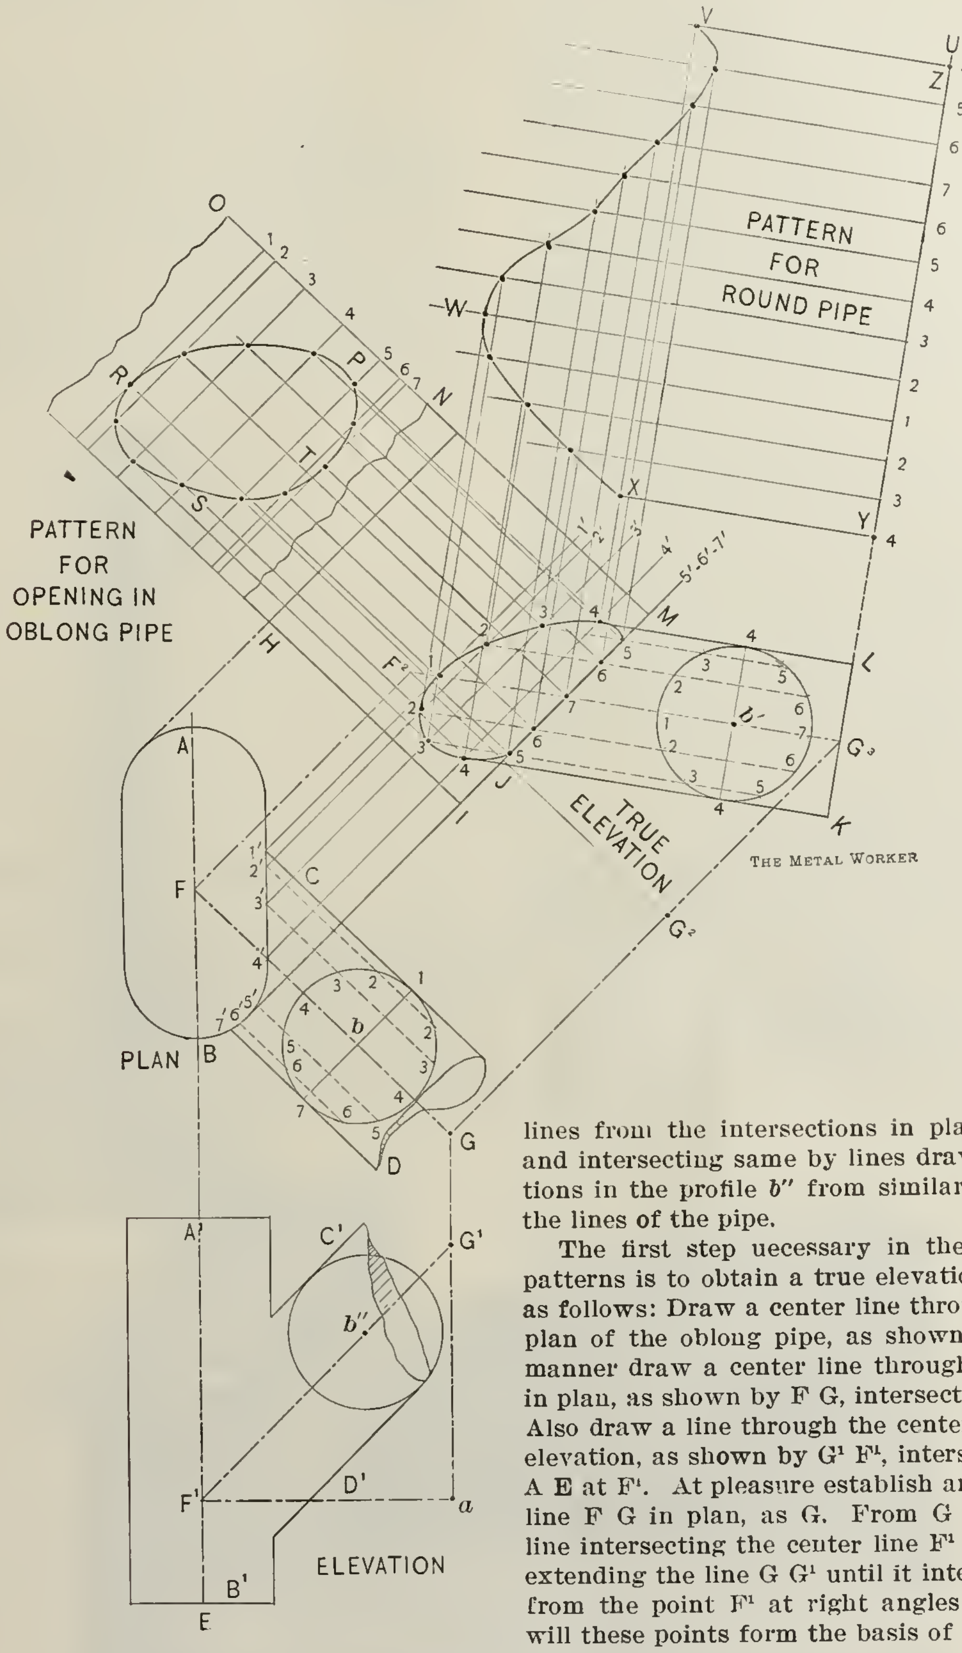
James Powers has sold out his plumbing stock and business and accepted a position as traveling salesman with the firm of Cooper & Cole, Hastings, Neb., wholesale dealers in Plumbing and Steam Supplies.

The Field & Shorb Company, Decatur, Ill., have been incorporated by William C. Field, William A. Shorb and W. T. Delahunty, with a capital of $15,000 to install heating and refrigerating plants.

Patterns for Intersecting Pipes.

A correspondent from New Haven, Conn., writes as follows:

"Will you kindly show me through the columns of *The Metal Worker* how I can lay out the patterns for a round smoke pipe that joins an upright pipe having flat sides and round ends, and is in position before it is necessary to connect the round pipe to it? The round pipe inclines to the vertical pipe at about 45 degrees, both vertically and horizontally. I am unable to find the true points of intersection between the two pipes. I have looked through 'The New Metal Worker Pattern Book' and through my files of *The Metal Worker* since 1892, and can find no example to help me. These files and the pattern book have been of great service to me and I have never been at sea on a problem before."



Patterns for Intersecting Pipes.—Plan Elevation, True Elevation and Patterns.

The reason our correspondent could not find the true points of intersections between the two pipes was because he did not construct a true elevation on the center line of the round pipe in plan. In the accompanying illustration the plan and elevation is a reproduction of our correspondent's sketch. A B in plan represents the oblong pipe, while C D shows the round pipe intersecting the oblong pipe at an angle of 45 degrees. A^1 B^1 shows the elevation of the oblong pipe intersected by the round pipe C^1 D^1, also at an angle of 45 degrees. The line of intersection in the elevation has been omitted, as it is not required in the development of the pattern. If the intersections were required for the purpose of making a finished drawing this could be done by dropping lines from the intersections in plan into the elevation, and intersecting same by lines drawn from the intersections in the profile b'' from similar numbers, parallel to the lines of the pipe.

The first step necessary in the development of the patterns is to obtain a true elevation, for which proceed as follows: Draw a center line through the elevation and plan of the oblong pipe, as shown by A E. In similar manner draw a center line through the round pipe C D in plan, as shown by F G, intersecting the line A E at F. Also draw a line through the center of the round pipe in elevation, as shown by G^1 F^1, intersecting the center line A E at F^1. At pleasure establish any point on the center line F G in plan, as G. From G drop a perpendicular line intersecting the center line F^1 G^1 in elevation at G^1, extending the line G G^1 until it intersects the line drawn from the point F^1 at right angles to A^1 E at *a*. Then will these points form the basis of measurements for obtaining the true elevation.

Now parallel to F G in plan draw the line F^2 G^2, equal in length to F G. At right angles to F^2 G^2 draw the line G^2 G^3, equal to *a* G^1 in elevation. Now draw a line from G^3 to F^2, which will represent the true length of the center line of the round pipe on F G in plan. At right angles to F^2 G^3 draw the line L K, equal to the diameter of the round pipe, and describe the circle *b'*, which divide into equal spaces, as shown. In similar manner describe the circle *b* in plan view, which divide into the same number of spaces, as shown from 1 to 7 to 1. Parallel to the lines of the pipe draw lines intersecting the oblong pipe at points 1' to 7'. Then at right angles to F G and from points 1' to 7' draw lines indefinitely, as shown, which intersect with lines drawn parallel to F^2

G^3 from similar numbered intersections in the circle b′, as shown by points in the miter line 1 to 7 to 1. Trace a line through points thus obtained, which will give the true points of intersections between the round and oblong pipes at an angle of 45 degrees, both vertically and horizontally.

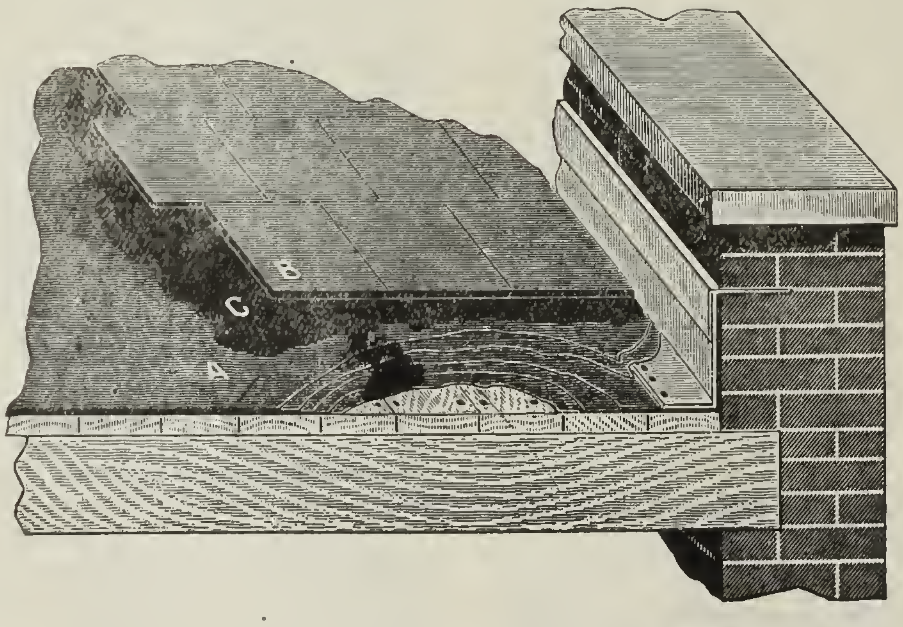
As confusion is apt to arise in numbering the points in circles b and b′ an explanation may not be out of place. Assume that 1 7 in plan of the circle b is a pivot, and the circle is turned so that one point 4 comes above and the other point 4 below, then for this reason should the points 4 and 4 in circle b′ come below and above respectively, as shown.

From the extreme point of the oblong in plan, as A, erect the line to the true elevation, as shown. Then will H I J K L M N be the true elevation of the round and oblong pipes. For the pattern for the opening to be cut into the oblong pipe extend the line M N, as shown by M O, upon which place the stretchout of the intersections on the oblong pipe in plan 1′ to 7′, as shown by the small figures 1 to 7 on N O. From these small figures and at right angles to O N draw lines, as shown, which intersect by lines drawn from similar numbered intersections in the miter line M F^2 J at right angles to M I. Trace a line through the points thus obtained, then will P R S T be the pattern shape for the opening in the oblong pipe.

For the pattern for the round pipe draw any line at right angles to J K, as Y U, upon which place the stretchout of the circle b′, as shown by 4 to 1 to 4 to 7 to 4 on Y U, thus bringing the seam on the line 4 L in true elevation. At right angles to Y U and from the small figures draw lines indefinitely, which intersect by lines drawn at right angles to M L in true elevation from similar numbers in the miter line M F^2 J. Trace a line through these points of intersections thus obtained in pattern, as shown by V W X. Then will V W X Y Z be the pattern for the round pipe.

Asphalt Roofing Tiles.

The Commonwealth Roofing Company, 100 William street, New York, are introducing their asphalt tiles for roofing, as here illustrated. What the company claim for this material is that it offers a new combination of accepted and standard materials, making possible a paved roof, light, strong, and flexible, made entirely of fire, water and frost proof bituminous substances. The sectional view of a roof herewith shows how the various features are combined. Letter A indicates layers of roofing felt cemented together, which is the same water proof base and binder as has been used for 40 years under slag, gravel, tile, and brick roofing. Letter B refers to the natural asphalt concrete tiles, another proved material in use for generations for street paving, walks, and floors. Letter C represents a thin layer of asphaltic cement of the same nature as both felt and tiles, used to bond the felt and tile and cause a perfect union. The tiles are 10 x 10 x ½ inches as supplied for roofing.

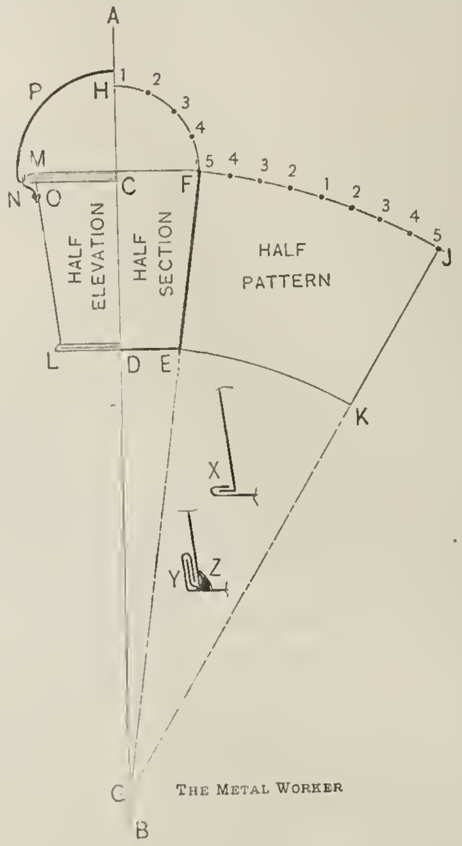


Asphalt Roofing Tiles.—Roof Section, Showing the Tiles and How Applied.

PATTERN FOR FLARING BUCKET.

Without Allowance for Laps.

Flaring buckets can be made of either black sheet iron and galvanized after they are made, which makes a tight seam and avoids any soldering; or they can be made of galvanized sheet iron or IX tin and soldered after being made.



Pattern for a Flaring Bucket.

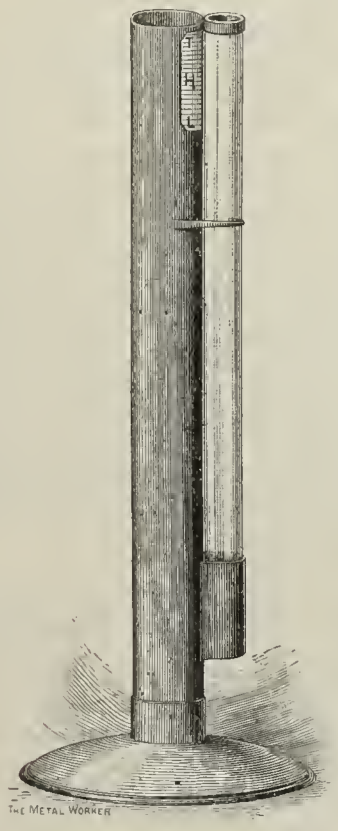
When developing the pattern for a flaring pail or bucket proceed as follows: In the accompanying illustration draw any line, as A B, upon which set off the hight of the bucket, as C D. From the points C and D, and at right angles to A B, draw the half diameters C F and D E respectively, as shown. Now draw a line from F to E, extending it until it meets the center line A B at G. With C as center and C F as radius describe the one-quarter plan C F H, which divide into equal spaces, as shown by the small figures 1 to 5. Now with G as center and radii equal to G E and G F draw the arcs

E K and F J. Then, starting at F on the arc F J, step off twice the number of the spaces contained in the quarter plan H C F, as shown by the small figures 5 to 1 to 5 on F J. From 5 draw a line to G, intersecting the arc E K at K. Then will F E K J be the half pattern of the bucket.

C D L M shows the half elevation of the bucket, in which M shows the wired edge, N the ear riveted to the bucket at O and P the wire handle. In double seaming the bottom to the body, X shows the first operation and Y the last operation, Z representing the soldering on the inner corner of the pail when made of tin or galvanized sheet iron.

Apparatus for Testing Solder.

Those who use solder are apt to experience some difficulty in getting just the quality of solder they desire. To overcome this trouble and to enable them to know just exactly what they are getting, F. C. Kuemmel of Bartlett, Hayward & Co., Baltimore, Md., is putting on the market the apparatus for testing solder, shown in the accompanying illustration. It consists of a metal tube with a glass gauge tube on the side. The glass tube is attached to the metal tube, which is supported at the bottom by a metal base. When complete the apparatus stands about 14 inches high. In using the tester the tube is filled with water to the indicator bar below the lettered gauge. The solder to be tested must be run into bars weighing exactly 1 pound and of a size that will readily go into the metal tube. If the solder is exactly half tin and half lead the water in the gauge will rise to the point marked H. If the solder contains more tin than lead the water will rise in the gauge toward the letter T in proportion to the amount of tin used in its composition, and if it contains more lead than tin the water in the gauge will rise above the letter L toward a point below the mark H, the hight varying according to the amount of lead the solder contains.



Apparatus for Testing Solder.

We are advised that the E. W. Bliss Company, Brooklyn, N. Y., have purchased the Coining Machinery and Press business of the Orr & Hess Machine Company of Philadelphia, who have been recognized as the leading manufacturers of this class of machinery, their Presses having been adopted by the United States Mint. The E. W. Bliss Company will now be in a position to supply the most approved machinery used in the manufacture of coins, medals, regalia and similar kinds of embossed work.

L. H. Solosth & Sons Stamping Works.

Referring to the illustration of stamped steel ceilings made by the L. H. Solosth & Sons Stamping Works, Grand Rapids, Mich., given in our last issue, the company advise us that all their ceilings are made of soft annealed steel, which, after stamping, is japanned. This is done so that if there should be any leakage the ceiling will not rust through. They use only the best white lead and linseed oil, in which sheets are dipped, and when dry enough they are put in a japanning oven and baked hard. The company advise us that they have the greatest call for the style of ceilings 2 feet square. They manufacture ceilings in various Rococo and Renaissance designs, and also make a fine line of coves, borders, moldings, cornices and wainscoting.

Waterbury Brass Company.

Waterbury Brass Company, under date of April 1, issue list of stock sizes of brass and copper sheet, rod, wire and tubing and German silver carried in stock at their New York house, 122-130 Centre street. This new warehouse, to which they removed a month or two since, as chronicled in our columns at the time, enables them to materially increase the stock formerly carried, and they are now carrying upward of 1,000,000 pounds of brass and copper in sheets, rod, wire and tubing. Their stock of brass sheet, wire and rod, brazed and seamless tubing is probably the most complete in the country. They also furnish braziers' copper and cold rolled and plain copper in various thicknesses. At the old store, 60 Centre street, they never carried their soldering coppers in stock, shipping them from factory. Now they are carrying a complete stock of straight pointed soldering coppers and roofers' coppers. The company advise us that the stock in their New York house is now complete, and that they can supply material in general demand promptly, shipping orders same day as received. The trade in the territory covered by this house will doubtless be glad to know of the comprehensive stock thus carried, as their wants are usually for material in this line that is required quickly.

FLASHINGS.

The Double Truss Cornice Brake Company of Buffalo, N. Y., have been incorporated with a capital stock of $75,000.

All the employees at the factories of the American Can Company in New York and Brooklyn went out on strike this week in protest against a " time card " system recently introduced by the company.

It is announced that the plant of the Jackson Iron & Tin Plate Company, Clarksburg, W. Va., will be completed and put in operation early in May.

The Tuscora Steel Company, Newcomerstown, Ohio, have started up three of the mills in their new Sheet plant. The fourth mill and galvanizing plant will be put in operation shortly. The Tuscora Steel Company were organized nearly a year ago with a capital stock of $200,000. Their product will be Black and Galvanized Sheets.

The Ferracute Machine Company, Bridgeton, N. J., are reported to have booked orders for special Presses for the British and Peruvian Governments.

The Kentucky Iron & Corrugating Company of Covington, Ky., incorporated with a capital stock of $25,000, are erecting a plant, 60 x 200 feet, equipped with the latest machinery and operated by electricity. The new plant is expected to be in operation this month. The incorporators of the company are J. C. Droege, Fred. Macke and J. H. Mersman.

Negotiations are reported to be under way between the Commercial Club of Worthington, Ind., and a company who propose to erect a Tin Plate and Sheet plant, employing about 500 hands, provided the town will raise a cash bonus of $60,000 and provide the necessary site.

The Niles Sheet Metal Lath Company of Niles, Ohio, have been incorporated with a capital stock of

$200,000, by Wade A. Taylor, C. S. Thomas, W. T. Holzbach, F. W. Stillwagon and John F. O'Dea, to erect a plant for the manufacture of Sheet Metal Lath. The works will be operated in conjunction with the Empire Iron & Steel Company, recently incorporated at the same place.

The Eller Steel Roofing Works, Canton, Ohio, have recently made shipments of their products to Cuba, the Bahama Islands and South Africa.

The New Orleans Roofing & Metal Works, New Orleans, La., have just finished the cornice work on the Nurses' Home at the Charity Hospital in that city. The firm are now busy with two other large contracts, one for erecting the copper cornice and ornamental copper bay windows on the new Macheca Building, on Canal street, on which they are also using their Tropical Composition Roofing. The second job is for the cornice and other metal work on the Tilton Memorial Building, erected for the Tulane University. They are doing a considerable amount of cornice and roofing work in other towns. The company manufacture a complete line of roofing material, and carry a stock of all sizes and gauges of Galvanized and Black Sheets.

The Follansbee Brothers Company, Pittsburgh, Pa., with branch offices in Chicago, Philadelphia and Louisville, are sending out a blotter for April 1 in which the monthly table is given upon the side of an umbrella stand containing a number of these useful articles and suggesting the season of showery days. A picture of a dueling scene gives point to the statement that "satisfaction" is felt by the users of the Follansbee Old Style Roofing Tin.

A blotter which is being distributed by George Callahan & Co., 218 Front street, New York, calls attention to Callahan's Elastic Paint Oil, which is claimed to be more durable than the best linseed for roofing purposes. The manufacturers state that this composition will not crack or peel, while it possesses other advantages which make it especially advantageous for use by roofers and builders.

The Huntington Tin & Planished Plate Company of Huntington, W. Va., have been incorporated with a capital stock of $50,000 to erect a rolling mill. B. W. Foster is president of the company; T. N. Boggis, vice-president; W. H. H. Holswade, secretary, and J. W. Valentine, treasurer.

John H. Roberts informs us that he has just started in business at West Homestead, Pa., to do Tin work, Spouting, Furnace work and general Sheet Metal work. He will also make a specialty of mill work. He desires to receive catalogues, price-lists and discount sheets from dealers in Tin Plate, Sheet Metal and Tinners' Supplies, also from manufacturers of Hot Air Furnaces and Furnace Fittings.

A lodge of the Amalgamated Association has been established among the employees of the Parkersburg Iron, Sheet & Steel Company, at Parkersburg, W. Va.

William Gimbert announces, under date of April 1, that he has sold his Slate Roofing business and good will to the G. F. Hogen Company, who will carry it on at the old location, 15 Craw avenue, Cleveland, Ohio. The company announce that they are prepared to make estimates upon Slate Roofing, Structural Slate and Electrical Slate.

E. W. Bliss, president of the E. W. Bliss Company of Brooklyn, N. Y., sailed on Tuesday by the "Kronprinz Wilhelm" for a two months' holiday in Europe.

The Juniata Steel & Iron Company, Greencastle, Ind., have broken ground for the erection of their new Tin Plate plant.

The American Tin Plate Company will install at the Monongahela Works, on the South Side, Pittsburgh, the continuous process for the manufacture of Tin Plate.

The three independent Sheet mills which recently bought the Burgess Works of the Crucible Steel Company of America at Portsmouth, Ohio, have organized under the name of Portsmouth Steel Company, who have been chartered under the laws of West Virginia with a capital of $300,000. Among the directors of the new concern are A. F. Baumgarten of the Maryland Sheet Steel Company of Cumberland, Md.; N. E. Whitaker of the Whitaker Iron Works of Wheeling, W. Va., and W. L. Glessner of the Laughlin Nail Company, at Martin's Ferry, Ohio.

The report that the new Sheet mill of the Parkersburg Iron & Steel Company, Parkersburg, W. Va., had been greatly damaged by a storm is incorrect. The only damage done was the blowing down of some columns being erected for the new bar mill building. The offices of the Parkersburg Iron & Steel Company have been removed from room 408, Times Building, to the mills at Parkersburg, W. Va.

The report that the cold roll and pickling equipments of the plant of the Sharon Tin Plate Company, Sharon, Pa., had been closed down on account of a strike among the men is not true.

Work is being pushed rapidly on the new Tin Plate plant being built by the Griffiths Charcoal Iron Mill, Washington, Pa. The hot mills, together with the tinning department, are practically completed. By reason of the damage done by a storm the forge and bar mill building will be delayed three or four weeks longer than contemplated. The knobbling fires are about finished and the firm have already commenced to burn charcoal for the same three miles outside of Washington, and fully expect to be manufacturing Tin Plate from charcoal by May 15 or not later than June 1 next.

N. & G. Taylor Company, manufacturers of Tin and Terne Plate and dealers in Sheets, Solder, &c., have removed their New York offices to room 1109, Townsend Building, Broadway and Twenty-fifth street.

Ambrose Beard, who has been division superintendent of the American Sheet Steel Company at Muncie, Ind., has been promoted to the more important district of the Dover works, embracing the Reeves works, Canal Dover, Ohio, and also the works at New Philadelphia, Dennison, Dresden and Canton, Ohio. He will continue to act in an advisory capacity for the Midland works and the Piqua, Ohio, works and will receive the assistance of another division superintendent, whose name will soon be announced.

Ceylon Plumbago Advancing.

In 1899 an interesting movement took place in the market for plumbago in Ceylon, which is the principal source of supply of the graphite industry of this country. There was a very sharp advance. The natives, who are alone able to conduct mining operations in the unhealthy regions of Ceylon, where the mineral is found, made so much money on the advance that production instead of being stimulated was lessened. During the years 1899, 1900 and 1901 the market fluctuated, occasional declines being followed by sharp rallies, thus keeping buyers and crucible makers in particular in a constant condition of uncertainty. Now, however, a sharp upward movement has again taken place. During the last four or five weeks there has been a rise of 35 to 40 per cent. above the figures which ruled two months ago. These prices concern chiefly good stock for the making of crucibles for brass and steel melting. There are reports of scarcity of supplies, and intimations are sent out that the miners have combined and are restricting the output. However that may be, the fact remains that prices are again seriously high.

The March returns of incorporations of large companies in New Jersey, Delaware, Maine and New York having a capital of $1,000,000 and over show a considerable decrease in capitalization as compared with February, the total declining to $158,150,000 from $294,850,000. In January the figures were $146,950,000. The largest concern incorporated last month was the International Nickel Company, with a capital of $24,000,000.

The property losses from floods in the State of Tennessee last week, according to conservative estimates, aggregated $5,250,000, and 25 lives were lost.

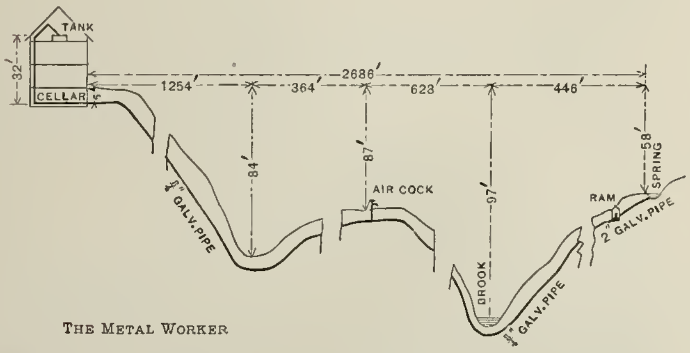
THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WANTS AN AUTOMATIC VALVE.

From G. S. D., Sunnyside, P. E. I.—A customer of ours wants us to install a hydraulic ram to supply water to his house and barn from a spring, which is over ½ mile from the house, and the pipe will have to go over a hill between the house and the spring, as shown in the sketch. I would like to find out if there is an automatic air valve made that can be placed on the service pipe at the point shown in the sketch, that will release the air without any further attention, and where it can be bought. It is over ¼ mile from the house to the hill where this valve is wanted, and if it should be necessary to go to the valve once a day, or even once in every two days, to let the air off, particularly in winter weather, it would be quite a bother. In the letter of "T. P." in *The Metal Worker* of February 8 he speaks of a small hydrant, but he does not say whether or not it is automatic. From this sketch it will be seen where it is proposed to locate a No. 5 ram, and how the pipes are to be run, and the size that we intend to use. The spring is 2686 feet from the house, and 440 feet from the spring there is a small brook that can be quite easily crossed. The tank is 84 feet above the level of the spring. You will say that it would be better to put in a larger pipe than the ¾-inch discharge pipe which we intend to use, but our customer has this pipe in stock and would like to work it in, if possible. Any information which you or your experienced readers on ram work can give us will be appreciated.



Wants an Automatic Valve.

Note.—There can be no doubt that the use of a larger discharge pipe would enable the ram to do its work more readily. We know of no such valve as mentioned, but should any of our readers be informed of anything that will answer the purpose we shall be glad to bring it to the attention of this correspondent. If instead of bringing the air vent to the surface of the ground it is placed in a covered pit, so that the frost will not so readily affect it, a cylinder may be connected at the top of the pipe, capable of holding about 2 gallons or more. Should any air collect in the discharge pipe or the branch to the cylinder it can pass up and escape to the air cylinder, so that there will be no occasion to empty the cylinder for several weeks. There should be a small stop cock at the top of the cylinder to allow the air to escape when a sufficient quantity has accumulated to affect the operation of the ram.

WHAT MAKES THE TORCH BLOW?

From B. McK., Augusta, Ky.—Answering the query of "Curiosity" in *The Metal Worker* of April 5, I am of the opinion that the blowing and overflow of the torch is caused by an accumulation of gas generated from the heat in the wick tube in the narrow case or torch. This does not occur in the old flaring torch, for the reason that it allows sufficient alcohol around the wick to keep it cool, thus preventing the generation of gas. If "Curiosity" will make his torch an inch larger in diameter he will find that his difficulty will be overcome.

WANTS COPPER COLORED SOLDER.

From W. C., New Haven, Conn.—I should like to know if there is any way of soldering copper without showing the solder.

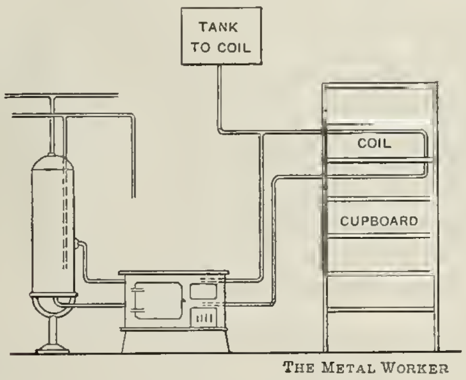
Answer.—In previous issues of *The Metal Worker* we have described a method for giving solder a copper color, and now reprint it for the benefit of our correspondent, as follows:

Prepare a saturated solution of the sulphate of copper in water, using for the purpose a glass or earthen dish. Apply some of this solution on the end of a stick or brush to the solder, when, on touching it with an iron or steel wire, the solder will become covered with a fine coating of copper. By repeating the operation the deposit will become thicker and darker. By this means a fairly substantial coating of copper may be produced, so that the soldered seams of copper work will have about the same color as the copper, and will show very little. If, on trial, the coating is not satisfactory, the solution is not strong enough, and can be strengthened by adding a little more of the sulphate of copper, or powdered blue vitriol, as it is sometimes called.

HEATING A COIL FROM A WATER BACK.

From W. H. C., Manitou, Col.—How can I heat a cupboard successsfully without steam gathering in the pipe and boiling in the tank when all the fixtures are placed as shown in the sketch herewith? The boiler is heated by means of a water back in the range in the usual manner. The tank which supplies water to the coil in the cupboard, as now arranged, boils over. Could the coil in the cupboard be attached to the supply pipe which furnishes hot water to the house, and where would be the place for the connection?

Answer.—There is no occasion to use an expansion tank in connection with the heating coil, if connected with the regular piping. It will only be necessary to carry a branch from the hot water service pipe at the top to the boiler over the coil and connect at the highest point; then, whenever there is hot water in the boiler, it will circulate through the coil in the cupboard.



Heating a Coil from a Water Back.

HEATING BATHROOM FROM WATER BACK.

From O. A., Groton, N. Y.—I should like to know if I would be likely to have trouble in heating a bathroom on the second floor from a 60-gallon hot water boiler connected with the kitchen stove? The bathroom is directly over the kitchen and is 8 x 9 feet in size. I propose to put a coil of 1-inch pipe connected with the return bends on the side wall, using 1-inch pipes for connecting the boiler with the coil. I shall put valves on the pipes to the coil in the bathroom, to shut it off in warm weather. Will it be necessary to put in an expansion tank? I have seen jobs that did not have an expansion tank. Would it be necessary to use expansion joints?

Note.—Two chapters in the book entitled "Kitchen Boiler Connections," which can be furnished by our

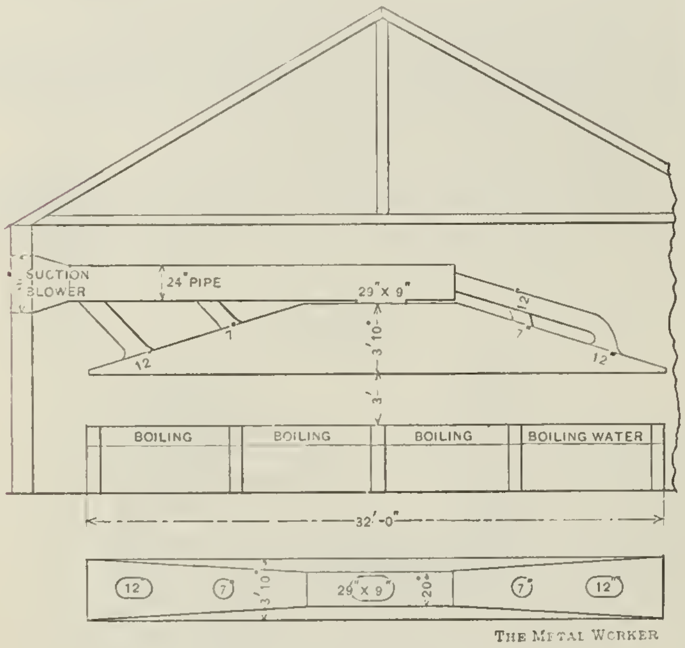
UNIVERSITY OF ILLINOIS
LIBRARY

Book Department, are devoted to this subject. The whole question to be decided is whether or not the water back in the stove has the capacity for heating the additional quantity of water required for warming the bathroom in cold weather. If it has, it is only necessary to determine the size of the coil required for heating the bathroom and to connect it with 1-inch pipes, as described. It will be necessary to place an air valve at the highest point in the heating coil in the bathroom, so as to allow the air to escape, which would otherwise accumulate and stop the circulation. As the temperature of water in the boiler will vary it will be desirable to provide 1 square foot of heating surface in the coil for every 25 cubic feet of space in the bathroom. Connected with the boiler in this way, neither an expansion tank nor expansion joints will be necessary.

REMOVING STEAM BY FAN.

From J. W. N., Arlington, N. J.—Will *The Metal Worker* kindly inform me if there is a better way to get rid of steam from hot water sinks than that shown in the plan and elevation given herewith? I have a 36-inch suction fan, running with 640 revolutions per minute. The pipe leading from the fan to the hood tapers from 36 to 24 inches, and the hood is connected with the pipe in several places, as shown.

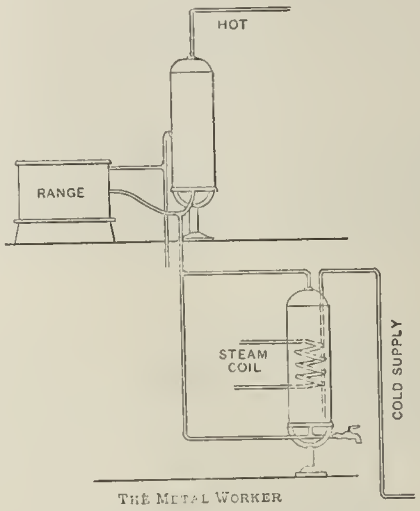
Answer.—The general design of this ventilating apparatus appears to be correct. The area of the pipe connections with the hood, however, is too large for an even distribution of the draft, their whole area being 534 inches, while the 24-inch pipe has an area of but 452 inches. The 12-inch pipe nearest to the fan will have a powerful draft and the 12-inch pipe at the other end a weak draft. We would suggest that the pipe nearest to the fan connection be made 8 inches in diameter and the central opening 29 x 7 inches, with all the rest of the openings the same size as shown in the plan.



Removing Steam by Fan.

A PROBLEM IN BOILER CONNECTIONS.

From H. F. S., Merrill, Wis.—In reply to the letter of "B. H. C.," in *The Metal Worker* of March 1, I would say that I have connected two boilers as shown by the accompanying sketch, and they work very satisfactorily. The difference between my job and his is that in my case the upper boiler was heated from a range while the lower boiler was heated by the steam coil. But this would make no difference, as they work either way as connected. I cut off the cold water supply from the upper boiler and attached it to the lower one. I then took a pipe from the bottom of the upper boiler and carried it to the bottom of the lower boiler, and ran a pipe up from the top of the lower boiler to the side connection in the upper boiler. This gives all the hottest water to the upper boiler, and when hot water is drawn for bath or other purposes it does not disturb the temperature of the water in the upper boiler by letting the cold water in, as the cold water feeds directly to the lower boiler, and when water is drawn the hottest water in the lower boiler passes to the upper one. If the lower boiler is the only one heated, the hottest water will still go to the upper boiler. If the upper boiler is heated by the range and there is no steam flowing into the coil in the lower boiler it will work the same as if only one boiler was connected. The connection suggested by "I. H. S.," in *The Metal Worker* of March 8, may work all right, but if a strong fire was run at both boilers it might raise steam, which would rise to the top of the hot water service pipe of the upper boiler and cut off circulation in the upper boiler.



A Problem in Boiler Connections.

New Publications.

Municipal Engineering and Sanitation. By M. N. Baker, Ph.B., Associate Editor *Engineering News*. Publishers, the Macmillan Company, New York, 1902. Price, $1.25.

Mr. Baker's work belongs to that class of books on technical subjects which it is a pleasure to read. It is intended as a review of the whole field of municipal engineering and sanitation, and not as an exhaustive study of the subject. It is divided into five sections: Ways and Means of Communication, Municipal Supplies, Collection and Disposal of Wastes, Protection of Life, Health and Property and Administration, Finance and Public Policy.

This book, which contains 309 pages and a comprehensive index, is thoroughly readable all through. It contains a great deal of valuable information, and discusses municipal questions and engineering problems in a way which will appeal to the "man in the street," and the more he is in the street probably the better he will appreciate the book.

Brass Founders' Alloys. By John F. Buchanan. Publishers, Spon & Chamberlain, New York, 1901. Price $2.

Mr. Buchanan, who is a practical brass founder, gives us in his book of 129 pages an introduction, six chapters and a comprehensive index. He writes in a very practical style as a man who knows whereof he speaks, yet relieves the monotony which such a book is apt to have by lighter touches here and there. He endeavors to present the practical features of the manufacturing of alloys on a commercial basis.

Plans are under way for the erection in Pittsburgh of a Temple of Labor, to be built and owned by the different labor organizations of the city. The building, as planned, will be a six-story structure containing a large auditorium, a number of meeting rooms and offices for the business agencies and officers of the various unions. About 20 labor organizations are interested in the scheme.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and about 1c. higher.

Copper is dull and rather weak.

Pig Lead remains quiet and without change.

Spelter is firm and slightly higher, but dull.

Antimony is unchanged.

Nickel is active at former price.

Aluminum is active and unchanged.

Tin Plates are quiet and prices firm.

Sheets continue in active demand, with heavy gauges scarce; prices are strong.

Foundry Iron is higher for spot and very scarce.

Sheet Copper is in good demand and firm.

Sheet Zinc is without change.

Scrap Iron rules lower in price, with less demand.

Scrap Brass and Copper are about ½c. lower.

Hardware shows much activity, with steady prices.

Plumbers' Supplies are moving in good volume; prices are generally higher.

Cast Iron Sinks have been advanced 10 per cent.

Plumbers' Brass Goods are likely to advance shortly.

Solder is ½c. a lb. higher.

Maslin Kettles are somewhat higher.

Wire Nails are very firm, with scarcity of some sizes.

Cut Nails are also firm at advance of 5c. a keg; stocks are broken.

White Lead is quiet, with prices steady.

Linseed Oil is firm and slightly higher, with fair demand.

Spirits Turpentine is dull and about 5c. a gallon lower.

Scrap Rubber is weak and dull.

METAL MARKET.

New York, April 11, 1902.

Pig Tin.—The London "bull" movement started about ten days ago assumed larger proportions during the present week. On Monday London prices shot sharply upward, and the higher level was held until Thursday, when the price fell off somewhat. The excuse given for the London advance was the rumor that the Dutch Government would reduce the quantity of Banca Tin to be disposed of at their bi-monthly sales. This report, however, was discredited in well informed circles, and was given an emphatic denial at the New York Metal Exchange. The volume of business here has been light, buyers showing little interest in the market. Jobbers' prices rule about 1c. a lb. higher than those obtaining at the date of our last report. Straits Pig, in small lots, is now quoted at 28½c. to 28¾c. per lb.

Copper.—The situation in the Copper market is decidedly dull. The demand is of very ordinary type, and prices show an easy and even weak tendency. While spot quotations are unchanged, it is said that some low prices have been made on future deliveries. Consumers, however, show but little interest in the market, and are buying scarcely anything beyond the limit of their current needs, being convinced that they will not be called upon to pay higher prices than those now ruling for their future supplies. Speculation in Copper is entirely absent. Retail prices are without change. Lake Ingot, in small lots, is quoted at about 13¼c. to 13¾c., and Casting Copper 13c. to 13¼c.

Sheet Copper.—The demand for Sheet Copper is about of the usual proportions. The mills are said to be busy and to find a market for all the product they can turn out. Consumers, meanwhile, are placing orders mainly for the supply of their present requirements. Prices are firm on the basis of 18c. per lb. from store.

Pig Lead.—No change is to be reported in this deparment. Prices remain the same and the market is dull and uninteresting, though firm. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report a good volume of demand for Pig Lead in that market. Prices are unchanged.

Spelter.—This metal continues strong and is a shade higher than a week ago. The volume of business, however, shows very little improvement. Jobbers quote good Western brands in small lots at 4.60c. to 4.70c. per lb. St. Louis advices report that the improved conditions in the Spelter market noted last week continue and business is on a more active and broader scale, with prices ruling somewhat higher.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions. Prices are unchanged at 6¾c. per lb. for 600-lb. lots and 7c. to 7¼c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S., 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—The situation in regard to this metal is unchanged. Small lots are quoted at 55c. per lb.

Aluminum.—Demand continues good and prices unchanged from their former level. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market is entirely unchanged and presents a quiet appearance. Dealers report a light volume of business, both in wholesale and retail way. The unsettled weather of the past week probably accounts for the falling off in orders from the small local consumers. Prices, meanwhile, are firm. American Bessemer Coke Plates, IC, 14 x 20, in small lots, are quoted at about $4.85 to $4.95 per box at New York and corresponding points. The American Tin Plate Company are booking contracts for deliveries up to the end of the third quarter of the year at existing prices. The competition of independent mills does not seem to have affected the market to any appreciable degree up to the present time, although it is possible that when the outside Tin Plate mills now building get into working order some evidence of competition may develop. Meanwhile, there is no sign of a superabundance of Plates. Available stocks, while of fair size and assortment, are by no means heavy, and in some cases are difficult to obtain for immediate delivery, except in very small quantities.

Sheets.—The demand for both Black and Galvanized Sheets continues heavy. Most of the mills are pretty well filled up with orders for the first half of the year. A great deal of business is offering for long future deliveries, but it is said that the independent Sheet manufacturers are not especially anxious to book such orders at present prices. Retail prices here are firm and unchanged. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at 3.85c. to 3.90c., and Galvanized Sheets at 70 to 70 and 2½ per cent. off the list.

Chicago advices are as follows: Manufacturers' agents report a good trade, which evidently is in line with conditions in other parts of the country, as the mills are becoming stiffer in their views as to prices. Some mills can make delivery of light Black Sheets in 30 days, but most of them are unable to do as well. Heavy Sheets are scarce, and very few mills are able to promise deliveries for several months. Jobbers quote small lots at 3.35c. to 3.45c. for No. 27 Black, and 70 and 5 for Galvanized.

Old Metals.—Supplies of Scrap Iron are becoming heavier and the demand has fallen off. Prices are not as firm as they have been and rule rather lower for some lines of Scrap. A fair demand exists for Old Metals of other descriptions. Scrap Brass and Copper quotations rule rather lower. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10 c.
Light and Tinned Copper	per lb. 8¾c.
Heavy Brass	per lb. 8 c.
Light Brass	per lb. 6½c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3⅜c.
Zinc	per lb. 3 c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 16½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	9.00 to 9.50
Burnt Iron, per gross ton	7.00 to 7.50

THE PIG IRON MARKET.

New York.—The scarcity of prompt Pig Iron continues and the market is very firm. We quote for forward delivery, Northern Irons: No. 1, $19.50 to $19.75; No. 2 X, $18.50 to $18.75; No. 2 Plain, $18 to $18.25, at tidewater. Tennessee and Alabama brands are as follows: No. 1 Foundry, $16.75, the official quotation, to $18; No. 2 Foundry, $15.75, the official quotation, to $17; No. 1 Soft, $16.75 to $18; No. 2 Soft, $16.25 to $17: No. 3 Foundry, $15.50 to $16.50; No. 4 Foundry, $15 to $16.

Chicago.—A considerable tonnage of Pig Iron has been sold during the past week, but the transactions have been in lots of under 1000 tons, and consisted mainly of small lots for early delivery. The furnace companies have largely sold their entire output for the remainder of the year, and in some cases running into the first quarter of next year. A few furnaces here and there, which have recently gone into blast, are profiting by the sharp demand for spot Iron, and are securing high prices for all they are able to offer. The leading Southern companies have not changed their schedule price of $12, Birmingham, for No. 2 Foundry; consequently this rate is continued in our quotations, although most of the Southern Iron sold brings $1.50 to $2 more. We quote as follows:

Lake Superior Charcoal	$21.50 to $22.25
Local Coke Foundry, No. 1	19.00 to 19.50
Local Coke Foundry, No. 2	18.50 to 19.00
Local Coke Foundry, No. 3	18.00 to 18.50
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	20.10 to 20.35
Southern Silvery, according to Silicon	16.90 to 19.15
Southern Coke, No. 1	16.40 to 18.65
Southern Coke, No. 2	15.65 to 18.15
Southern Coke, No. 3	15.15 to 17.65
Southern Coke, No. 1 Soft	16.40 to 18.65
Southern Coke, No. 2 Soft	15.65 to 18.15

Philadelphia.—The exceptional conditions noted in our last report are still in evidence and are more strongly defined than ever. The scarcity of Pig Iron for early delivery is causing a great deal of anxiety, and many mills and foundries are suffering inconvenience in consequence. Unfortunately there is no prospect of better service in the near future. Everything that can be made available for shipment during the next 90 days is promptly taken at whatever price may be asked. Prices are hard to quote, but No. 2 X Foundry averages about $20 for deliveries up to July. As near as can be given, the present prices are about as follows for Philadelphia and nearby points:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$20.50 to $21.50	$20.00 to $21.00
No. 2 X Foundry	19.75 to 20.50	18.50 to 19.00
No. 2. Plain	18.75 to 19.00	17.50 to 18.00

Pittsburgh.—The sale of 200,000 tons of Standard Bessemer Pig Iron to the United States Steel Corporation at $16.50, at furnace, for delivery in the last quarter of the present year and the first quarter of next year, has pretty well cleaned up all the available Iron. There is practically a famine in Pig Iron, and it is pretty well established that the market will not be much lower this year, but may, on the other hand, go considerably higher. There is a heavy demand for Foundry Iron, consumers buying for delivery clear into next year. We quote No. 2 Foundry Iron at $19.50 to $20, f.o.b. Pittsburgh.

Cincinnati.—The situation in the Pig Iron market shows no change. There is practically no spot delivery of Southern Iron in sight. Although the $12 limit on No. 2 Southern Iron is said to be held by the producers, some contracts are being made for amounts from 200 to 1000 tons on the basis of $13.50 to $15, Birmingham, and this for delivery for the last quarter of the year. We quote as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$16.75 to $17.75
Southern Coke, No. 2	16.25 to 17.25
Southern Coke, No. 3	15.75 to 16.75
Southern Coke, No. 4	15.25 to 16.25
Southern Coke, No. 1 Soft	16.75 to 17.75
Southern Coke, No. 2 Soft	16.25 to 17.25
Southern Coke, Gray Forge	15.25 to 16.25
Southern Coke, Mottled	15.75 to 16.75
Ohio Silvery, No. 1	20.60 to 21.10
Ohio Silvery, No. 2	20.10 to 20.60
Lake Superior Coke, No. 1	19.85 to 20.35
Lake Superior Coke, No. 2	19.35 to 19.85
Lake Superior Coke, No. 3	18.85 to 19.35

St. Louis.—The volume of business in the Pig Iron market in the past week has been on a limited scale. Prices are very variable and quotations, f.o.b. St. Louis, from $17.25 and higher for No. 2 Foundry, and $18 and upward for No. 1, but for the most part these are for small lots. We quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $18.00
Southern, No. 2 Foundry	15.25 to 17.25
Southern, No. 3 Foundry	14.75 to 16.75
Southern, No. 4 Foundry	14.25 to 16.25
No. 1 Soft	15.75 to 17.75
No. 2 Soft	15.25 to 17.25

CHICAGO REPORT.

Scrap Iron and Steel.—Market is quiet on the whole. Consumers are not as active as a week ago, but stock is coming in freely. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Pet net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 8.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—The demand is not very active, and consumers are loaded up in excess of immediate wants. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.60c.
Tea Lead	3.25c.
Zinc	2.75c.
Tin Foil	18 c.
Pewter, No. 1	15 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—There is no change in conditions reported last week, and prices are unchanged. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6⅛c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Rags are offered in large quantities, but little demand exists. Good Country Mixed Rags, Chicago delivery, 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—The demand is very good, as prices will be absolutely maintained. Prices are as follows. A discount of 50c. is allowed on the following schedule for all coal shipped in April:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

The dry kiln of the Hurd Refrigerator Works, at New Duluth, Minn., was recently destroyed by fire, doing damage to the extent of $3000, which is covered by insurance. The kiln will be immediately rebuilt, the greater loss being in the valuable lumber used in the construction of the company's high grade Refrigerators.

THE HARDWARE TRADE.

The volume of trade throughout the country is large and of exceptionally satisfactory character, manufacturers alluding to it as heavy and all they can take care of. The requirements at present from the Central West are, perhaps, greater in proportion than from the other sections. Manufacturers generally are busy, some of them working on orders taken last fall, parts of which are still unexecuted. One leading concern in a New England manufacturing center are operating an important department double turn for the first time in their history. Considerable interest in the consolidation of hardware jobbers is being manifested, and there is much inquiry as to the facts concerning this important trade development about being consummated. Some producers report a temporary slackening of orders during the past week or two, which is partially attributed to the consolidation referred to. Merchants about to enter into radically new relations in the conduct of their business would naturally be conservative in placing orders for goods other than for immediate wants. The market is steady in matter of prices and an upward tendency is noticeable in several lines. The foreign trade in manufactured merchandise continues to be an important factor in the business of the country.

very brisk at the present time and Brass Goods prices in this section are still very much unsettled, but the business in the West and in the middle section of the country is in such shape that manufacturers should have no difficulty in getting the advanced prices.

Enameled Bathtubs.—As noted in our last issue, the Standard Sanitary Mfg. Company issued on April 1 a new price-list on the Porcelain Enameled Bathtubs of their manufacture, in which the list prices are materially reduced from those on the old list. A new classification of the Bathtubs was also made. The discount on the new lists, which are presented below, bring the price to practically the same level as that of the old high list. The discounts are as follows:

Regular patterns, guaranteed	30 %
High grade and special patterns, guaranteed	15 %
Pool Tubs, Receptors, Sitz Baths and Foot Tubs, guaranteed	15 %

The prices given below do not include decorations or trimmings, except common overflow fittings on regular style Tubs. All fittings and decorations for Baths will be charged separately and at net prices. A charge of 50 cents net extra is made for crating Bathtubs and $1 net extra for boxing the Tubs. The freight conditions are unchanged. The list is as follows:

Price-List D.—Porcelain Enameled Bathtubs.—April 1, 1902.

Pattern.	Made by	4-foot.	4½-foot.	5-foot.	5½-foot.	6-foot.

NOTES ON PRICES.

Plumbers' Brass Work.—A meeting of the manufacturers of Plumbers' Brass Work was held at the Arena, New York City, on Thursday and Friday, March 28 and 29. Representatives from all sections of the country were present at this meeting. According to reports the business of the Brass manufacturers is in much better shape. It is said that a strong feeling was developed at the meeting in favor of an advance of 10 per cent. in the price of Brass Goods, and that this advance was strongly recommended by the association, but no final action was taken to that end. It is understood that the matter will come up again in a very short time, and that the advance is likely to be adopted all over the country. Business in the metropolitan district is not

Cast Iron Sinks.—The manufacturers of Cast Iron Sinks withdrew prices on the 5th inst. and announced an advance of 10 per cent. The advance went into effect immediately. All the larger manufacturers of Sinks have adopted the new discounts. Seemingly, the prices were issued after joint action had been taken by the manufacturers.

Solder.—Manufacturers of Solder have advanced quotations about ½ cent a pound on the strength of the rise in Pig Tin. Jobbers are quoting small lots of Half and Half, guaranteed, at 18 to 18½ cents and No. 1 at 15½ to 17 cents per pound.

Solder Testing Apparatus.—The Solder Testing Apparatus illustrated and described in another part of this issue is manufactured and sold by F. C. Kuemmel, with Bartlett, Hayward & Co., Baltimore, Md., at $2.50 net.

Maslin Kettles.—The market on this line of goods is firm and steady at the somewhat higher prices recently determined by the manufacturers.

Radiators.—Under date of April 1 the United States Radiator Company, Dunkirk, N. Y., issued a new price-list of their Radiators. A careful examination shows a few unimportant changes in price.

Wire Nails.—The demand for Wire Nails in New York is referred to as satisfactory. Considerable difficulty is experienced in supplying the wants of the trade, as the mills are now oversold for at least 30 days. Stocks are broken, and the market is practically bare of some sizes. The market has a decidedly firm tone. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—The market is firm at the advance of 5 cents per keg made last week. Difficulty continues in obtaining full assortments of Nails from mills, and local stocks are somewhat broken. Small lots from store are quoted at $2.25 to $2.30 per keg.

White Lead.—Unsettled weather has the effect of curtailing the demand for White Lead in Oil. This, however, has enabled the manufacturers to catch up with their orders to some extent. Indications point to a large spring business. Prices are firm and unchanged, retail quantities being sold at 6½ to 6¾ cents per pound.

Linseed Oil.—The movement in Linseed Oil is fair and the market is strong. Quotations are without change, City Raw, in small lots, being quoted at about 64 to 64½ cents per gallon, Boiled Oil being 2 cents advance on Raw.

Spirits Turpentine.—The price of Turpentine has declined further during the week. The unsettled condition of the market has kept large buyers from purchasing. The demand is light in the local market. Small lots of Turpentine are quoted at about 46 to 46½ cents per gallon.

Old Rubber.—The market is dull and prices are not strong. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	5 c.
Rubber Shoes, less than carloads, per lb	6½ to 6¾c.
White Wringer Rolls, per lb	6¾c.
Inside Bicycle Tubing, per lb	21½c.
Outside Tubing, per lb	6 c.

TRADE NOTES.

The Sanitary Refrigerator Company of Detroit, Mich., have been incorporated with a capital stock of $250,000.

The Acme Fuel Compound Company, with principal office at 185 Montgomery street, Jersey City, N. J., have been incorporated with a capital of $125,000 by John W. Avery, George R. Allison and G. C. Thornton, to manufacture Fuel Compounds.

The Forsyth Pattern Works, Youngstown, Ohio, have bought the ground and buildings vacated by the American Can Company in that city, and will adapt them for extension to their Pattern making plant.

The Smokeless Fuel Company, Cincinnati, Ohio, are sending to manufacturers a neat little circular inviting a test of their new River Smokeless Coal, which is furnished in egg, lump and run of mine sizes.

New York Metal Exchange.

The following standing committees for the fiscal year 1902-1903 have been announced by the Board of Managers of the New York Metal Exchange: Executive: Adolph Lewisohn, chairman; H. H. Hendricks and Wm. Jay Ives. Finance: L. Nachmann, chairman; B. Hochschild and Geo. W. Jaques. Law: J. H. Lobdell, chairman; Wm. Jay Ives and B. Hochschild. Floor: C. S. Trench, chairman; L. Nachmann and C. Mayer, secretary. Warehouse: B. Hochschild, chairman; S. A. Jennings, S. H. Bolles, Jr., J. H. Lang and Robt. Gentle. Trade: C. S. Trench, chairman; L. Nachmann, E. A. Caswell, L. Vogelstein and C. Mayer. Pig Iron: G. H. Hull, chairman; James E. Pope, Jr., and Thos. W. Stiles. Pig Tin: B. Hochschild, chairman; L. Nachmann and C. S. Trench. Copper: Jesse Lewisohn, chairman; B. Hochschild and L. Nachmann. Lead: J. H. Lang, chairman; E. A. Caswell and Frank H. Davol. Spelter: G. E. Behr, chairman; W. Fisher and L. Vogelstein. Quotations: Edmund Hendricks, chairman; Jesse Lewisohn, C. S. Trench, J. Langloth and C. Mayer, secretary.

Samples by Mail.

Write at once.

Patent Pending.

Best Hanger Ever Invented.

Why It Is The Best:

1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides.
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwan's Chimney Top.

Iwan Bros., Mfrs. of Hardware Specialties, Streator, Ill.

CALLAHAN'S SPECIALTIES.

ELASTIC PAINT OIL. . .	Actually more durable than Linseed for Roof Painting. Will not peel, blister or crack. 45c. per gal.
RUBBER ROOF CEMENT.	Always elastic. Very adhesive. Never gets hard in packages. Never brittle on roof. *Sticks to wet roof.*
PIPE JOINT CEMENT . .	Makes unleakable joints, but admits of easy separation. Prevents all rusting. Is actually cheaper than red lead and better..
SOLDERING FLUID. . . .	Non-corrosive. Non-poisonous. No fumes to give headaches. Keeps the soldering iron tinned. No black streak on joint.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

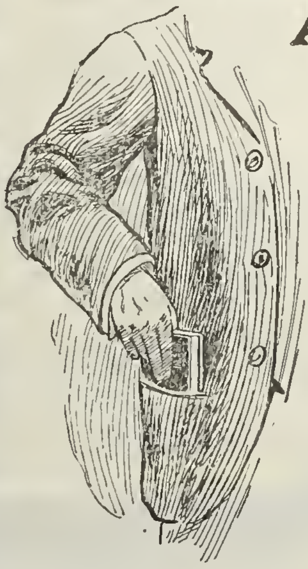
TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION



A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 — Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 — Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 — Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

DAVID WILLIAMS CO
—— PUBLISHERS ——
232-238 William St., N. Y.

A great many dealers

Understand by this time what our trade mark signifies. It means Merit, Originality and Exclusiveness in Metal Ceilings.

It used to be predicted, when we first began to place our ***"Classik" Metal Ceilings*** on the market, that there was no demand for such high-grade, symmetrical and exclusive creations.

Either there was a demand, or we have created it, for our goods are called for from one end of the Continent to the other, and even competitors are recognizing their merit to such an extent as to copy them.

We had an advanced position when we originated and put in operation the idea of producing Metal Ceilings in complete "classified" designs of famous artistic style.

It is all very clear to us why our line has been successful. They are artistic and adapted to all classes of buildings, and a source of gratification to all who had a desire to decorate rooms in harmony throughout.

If you are seeking up-to-date ceilings (and not a conglomeration of past ideas) we are competent to supply you.

Send sketch and correct measurement of room for estimate.

FIRE PROOF. LOW PRICE, DURABLE.

BLACK ASPHALT ROOF PAINT

It is used extensively in every State in the Union. It withstands extreme heat or severe cold, and has a tenacity and elasticity peculiarly its own. It is ready for use, easily applied, protects and preserves any exposed surface.

For Tin and Iron Roofs. also Bridges, Gas Tanks and Underground Pipes

This Paint has never been equaled. **TIN ROOFS,** even when rusted, broken and leaking, can be rendered water-tight and serviceable; our Asphalt Roof Paint and Cement fills up holes, breaks, joints, and by its elastic and tenacious qualities keeps the roof tight.

STOWELL MFG. CO., - - Jersey City, N. J.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING,
  2. FLARING WORK,
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE DOUBLE TRUSS CORNICE BRAKE CO.
BUFFALO, N. Y.

New In Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the head and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

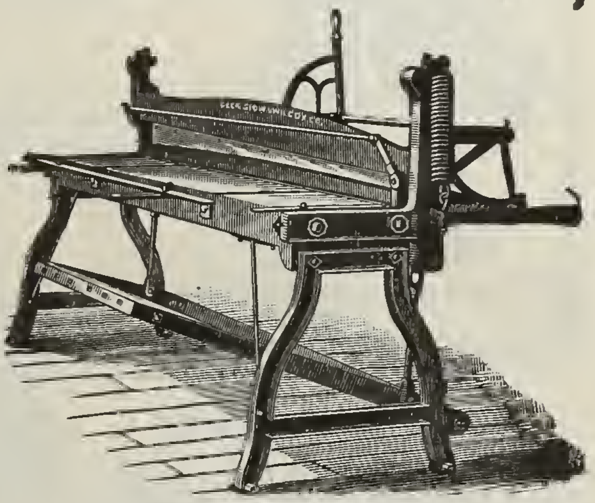
HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD. 96 inches long.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron. 96 inches long.



CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron. 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

Shear, Punch and Notcher.

— WITHIN THE LIMIT.—"Look here!" cried the victim, "you said that house was just a stone's throw from the station."

"Well?" inquired the real estate agent.

"Well, the distance is half a mile at least."

"Is that all? Time and again I've seen a blast in a quarry that would throw stones upward of a mile."

— NOT LOADED FOR BEAR.—"Once when I was out for rabbits and not prepared for anything bigger," said the talkative sportsman, "I almost stumbled over a big black bear."

"I know what you're going to say," interrupted the scoffer.

"What?"

"That you realized at once what trouble was bruin."

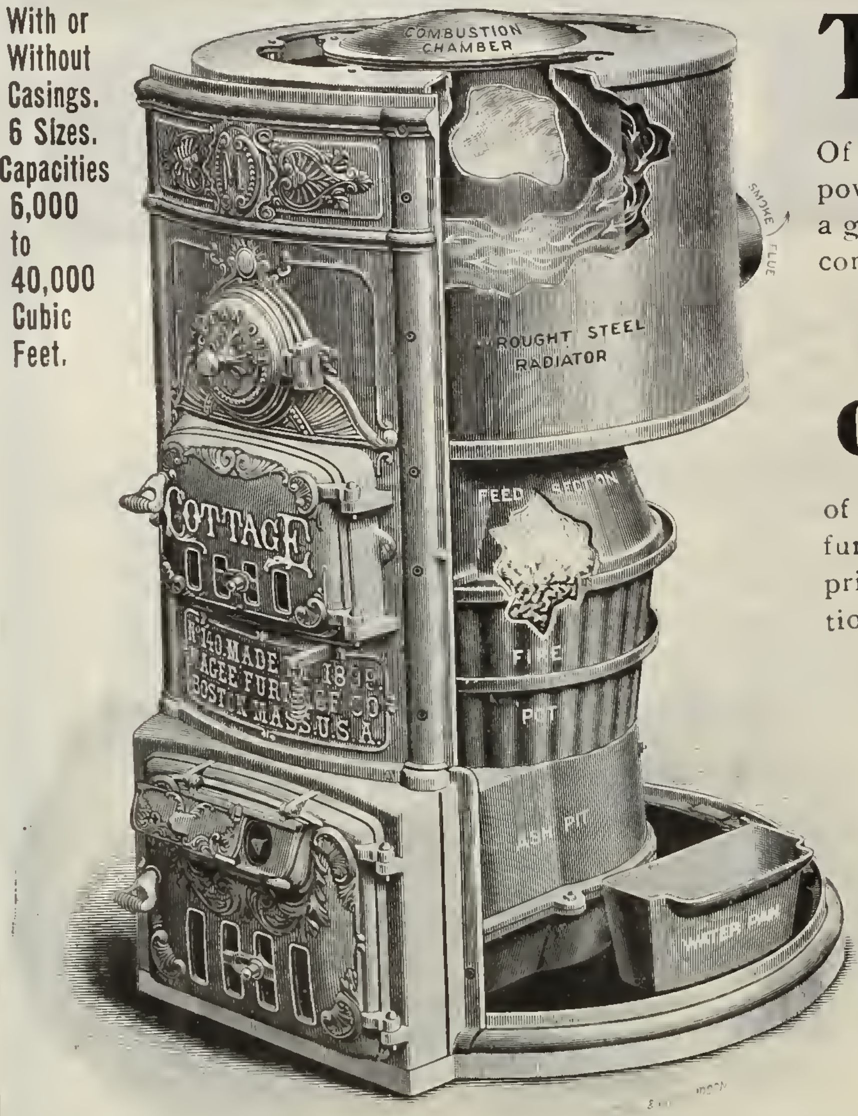
With or Without Casings. 6 Sizes. Capacities 6,000 to 40,000 Cubic Feet.



The Best Test

Of a furnace, with reference to its heating power, is the amount of space it will heat with a given amount of fuel under a proper state of combustion. We make the distinct claim for our

Magee Cottage Furnace

of superiority in this respect over any and all furnaces where a high grade furnace at a low price is desired. It is not offered in competition with inferior grades, designed especially for the cheapest class of work, but is a construction from which the greatest amount of heat can be obtained from the least amount of fuel, and at the same time add to your reputation.

Send for Catalogue.

Magee Furnace Co.,
BOSTON.

Most complete line under one name in the United States.

IF YOU ARE NOT SELLING THE

Peck=Williamson Underfeed Furnace

you have not the trade and are not making the money you might Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

HAS

TALKING POINTS

OF MERIT

FOR THE DEALER.

SIMPLICITY.

In construction the Patric Furnace is exceedingly simple. This point always appeals to the prospective purchaser. No clogged radiator. It needs no clean-outs. Look at the illustration and see for yourself.

DURABILITY.

This is one of our hobbies. The Patric Furnace is noted for its durability. One man writes that his furnace has been in use every winter since 1873, twenty-nine years, and still heats as well as when it was first put in. Good materials account for that. We use them now and always have.

SMOKE-BURNING and COKING MAGAZINE.

Here's where we have a winner. It is a scientific feature that sells lots of Patric Furnaces. Used only on the Patric. A success for the past 17 years. Highly recommended by our customers. Cokes the coal and burns the volatile parts of the smoke and gases. A great talking point.

OUR HOT-BLAST.

Our hot blast device for aiding combustion delivers heated air directly into the combustion chamber. No part in the fire to clog or burn off. Your customers must have a hot-blast.

Send for catalogue, price-list and discounts to dealers.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

The American Furnace Co.,
1911-13 PINE STREET, ST. LOUIS, MO.

INDEPENDENT REGISTER CO.,
152 Champlain St., CLEVELAND, O.

Common Sense Circulator and Radiator.

(Patent applied for.)

This Heater is so simple that its superiority over all others is plain. Being open at each end the cold air is taken in at the bottom, passing out at the top heated; producing a circulation unequaled by any radiator. Is easily cleaned or repaired. Takes the place of a joint of pipe. Diameter of casings, 10½ and 12½ inches. Send for prices.

BATTLE CREEK, MICH.

The Jones
SIDE-WALL
Warm-Air
Register

Has the largest area of any Side Wall Register on the market. Just 50 per cent. more than others. The one that has a ***double register box*** included with the register and is

Ready to Install When Received

A sample of many testimonials we have received.

BATTLE CREEK, MICH., MARCH 12, 1902.
THE UNITED STATES REGISTER CO., Ltd., City.

GENTLEMEN: I have installed your Jones Side Wall Registers in 52 residences in this city during the last two seasons, and in every case they gave entire satisfaction. The plan of heating two rooms, one on the first floor and one on the second, being a new departure, I hesitated about adopting it in my furnace business, but after seeing it tried in Mr. Stewart's house, was thoroughly convinced, and install all my furnaces that way now.

I believe this plan of heating is as far ahead of the old plan as electricity is ahead of lamps. My customers all insist on having the Jones Side Wall Registers. I have all the other styles in stock, but consider the Jones far ahead of any of the others, because it has a double register box and is ready to install when received, and because it has more capacity than any other.

A furnace dealer is certainly not abreast of the times unless he uses the Jones Side Wall Register.

Yours very truly,
LAFAYETTE MOBLE, The Furnace Man.

A New and Handsome Design.

THE
Dandy Oven.

A double oven, made of polished steel or tin, beautifully japanned top and front frame, drawn steel bottom rim, superior to the breakable cast-iron rims. All-wire oven racks. Adapted for cast-iron lamp stoves, tin stoves and gas hot plates. Send for price.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Kitchen Boiler Connections

A New and Enlarged Edition.

The attention of readers of The Metal Worker is directed to the *fifth and enlarged edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

A Selection of Practical Letters and Articles Relating to Water-Backs and Range Boilers . . . . .

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

In Chapter I. Kitchen Boiler Below Range.
" VI. Water Hammer in Boiler Connections.
" VIII. Proper Connection for a Horizontal Boiler.
" VIII. Double Water Back Instead of Double Boiler.
" VIII. Two Horizontal Boilers Connected with One Water Back.
" IX. Supplying Hot Water in Large Buildings.
" X. Lime Deposit.
" XII. Hot Water Supply and Heating a Barn.

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

It tells How to Connect Kitchen Boilers and Water Backs Under All Conditions.
It explains Remedies to apply to all kinds of Difficult Cases.
Heating from Kitchen Boilers is fully described.

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

THE METAL WORKER
Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspond* with that retained by the person who receives the stove for storage.

100 Receipts and 100 Duplicate Records, $1.00
Sent, post-paid, on receipt of price, by
DAVID WILLIAMS CO., Publishers,
232-238 WILLIAM ST. - NEW YORK.

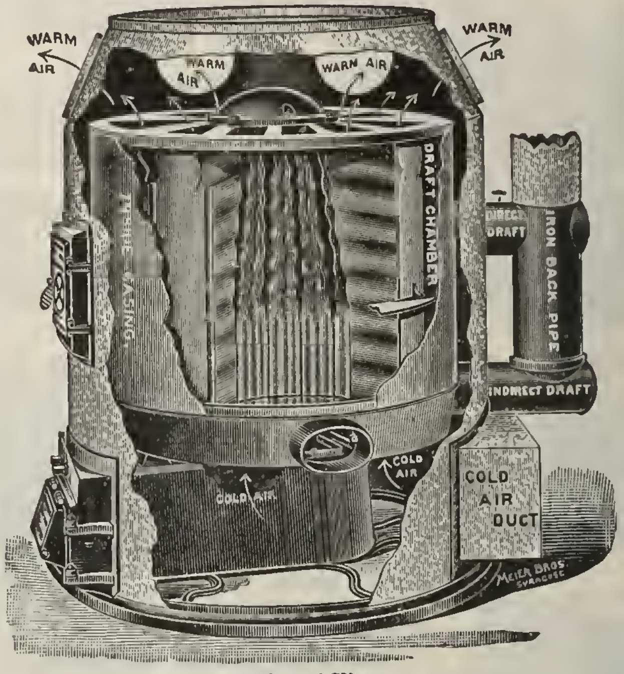
The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.



Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

The Plumbers and the Supply Trade.

To those familiar with what is going on in the plumbing trade it would seem that there are two elements at work, one favoring more harmonious relations than now exist, and the other having more narrow aims. While there is no positive evidence that overtures have been made by the national bodies of either the plumbers or the supply associations, indications are visible of a strong undercurrent tending to bring the executive committees of the two bodies together for the purpose of adjusting some of the differences which now exist. On the other hand it would seem that some of the local and State associations of plumbers are pursuing the football tactics of searching for weak places in the lines. In some instances resolutions have been adopted or agreements have been presented to the jobbing trade for consideration and signature which have met with disapproval on the ground that the demands are unfair, conveying an arbitrary power to the plumbers without any compensating advantages to the supply trade. This has had the effect of encouraging a feeling that the plumbing trade enjoys an abnormal protection, and that the wholesale trade would derive some benefit from selling plumbing goods to all buyers, reserving a better price for the legitimate plumbing trade. Such a course would lead to an open market for plumbing goods, and there are not wanting dealers who are eager to include the standard line of plumbing goods in the extensive line of merchandise that they now carry for sale to the general public. It is improbable, however, that an open market for plumbing goods will be made for some time to come, for the conservative element in both branches of the trade fully appreciate the great disadvantages that would result. The wholesale houses recognize that it is much less laborious and expensive to handle and fill the orders of experienced buyers than it would be to educate others in the infinite variety of detail that must be learned before plumbing goods can be bought satisfactorily.

Consolidation in the Stove Trade.

The approach of the annual convention of the National Association of Stove Manufacturers, to be held in New York on May 14 and 15, has caused the revival of rumors of a projected consolidation of the leading stove manufacturers. A short time ago the local papers of Reading, Pa., mentioned the name of Ex-President Lazard Kahn of the National Association as being actively engaged in promoting consolidation in that center. The latest rumor, emanating from Nashville, Tenn., credits Mr. Kahn with being the father of a movement for the consolidation of between forty and fifty of the largest stove plants in the country. A dispatch to the *Chronicle* of Chicago states that the financing of the new company will require over $100,000,000 in cash, and asserts that everything indicates the combine will be an assured fact when the National Association of Stove Manufacturers meets in New York next month. That the subject of consolidation has been exploited and that options on many plants have been given to promoters is well known, and it is said that the options granted most recently have been on a more businesslike basis and more favorable to consolidation than those secured by the earlier promoters. It has also been reported that some men prominently engaged in the stove manufacturing trade in the West have assented to the proposition that a consolidation will be effected. Nothing more substantial than rumors has yet come to light, however, and it is probable that no authoritative announcement of a consolidation will be made until it is actually effected.

The Right to Strike.

An interesting decision regarding strikes was handed down the other day by the Court of Appeals at Albany, N. Y., whereby it was ruled that workingmen have the right to organize for the purpose of securing higher wages or shorter hours of labor, or for otherwise improving their condition, and that they have the right to strike, "provided the object is not to gratify malice or inflict injury upon others, but to secure better terms of employment for themselves." The case in which this ruling was made was that of the National Association of Steam Fitters and Helpers against the Enterprise Association, a rival organization of steam fitters. The one body of workmen insisted that contractors should not employ the members of the other association, who worked for lower wages, but should, instead, employ their own members, and caused strikes which resulted in ousting from employment all those of whose rate of wages they complained. The association whose members were displaced secured an injunction from the lower courts restraining the defendants from striking or making threats of strikes; but this action was reversed by the Appellate Division on the ground that members of labor organizations did not have to work with other employees not members of their organization and that they may legally initiate a strike to enforce their demands. The Court of Appeals, in sustaining the decision of the Appellate Court, took the still broader ground that the defendants had the right to strike for any reason they deemed a just one and also had the right to notify their employers of their purpose to strike. "A labor organization," the court said, "is endowed with precisely the same legal right as an individual to threaten to do that which it may lawfully do." This view will probably be concurred in by a majority of the public, although it is perhaps worth noting that the decision in this particular case was reached by a bare majority of one in a bench of seven judges.

A rather more startling decision was made last week by a judge of the Supreme Court in Brooklyn, N. Y., in the case of a printing company in that city, who applied to the court for an injunction restraining their striking employees from interfering with or assaulting nonunion men who had been employed to take the places of the strikers. The Judge refused the application for an injunction on the ground that it was unnecessary, and even berated the company for invoking the aid of the courts for the protection of their nonunion workmen. This decision was followed, a few days later, by a savage assault by the strikers upon one of the employees of the firm who were refused the injunction. This case has aroused a great deal of public interest and comment. It is felt that, while workmen are perfectly justified in striking for the purpose of securing advantages to which they deem they are entitled, employers, on the other hand, should be supported in their right to fill the places of the strikers; and, moreover, that the law should be ready to prevent any interference with men who are willing to work by those who have thrown up their employment.

Public Baths.

In an age in which hygiene and sanitary science command so much attention and when appliances for securing cleanliness have been brought to so high a point of perfection, it is astonishing that so few opportunities for personal cleanliness should be provided for the multitude in our great cities. While the private dwellings of the more comfortably off citizens are equipped, as never before, with hot and cold water, bathtubs and stationary wash bowls, open plumbing and all the most approved appointments for the promotion of personal cleanliness, and when even many shops and factories are furnished with elaborate apparatus for ablutions, whole sections of the more densely populated parts of our cities are too often unprovided with any sort of facility for the poorer portion of the community to practice—at least in the winter time—that virtue which proverbial authority teaches us is next to godliness. In New York City, for example, the only public bathing facilities offered to the inhabitants of the tenement districts are the floating baths which the rivers or tides flow through. These baths are often none too clean or inviting in themselves, while the water is not seldom fouled by mud and sewage, so that, for purifying purposes, their advantages are doubtful. And they are patronized, as a rule, only by the younger element of the population. Moreover, they can only be used for a few months of the year. During the rest of the year nothing of the kind is available. Under these circumstances it is not too much to assume that a large proportion of the denizens of the Empire City never bathe from summer to summer, and some never bathe at all. In this matter, as in that of other public conveniences, New York is far behind the leading European cities, as well as some of our own American cities, which provide places where the people, for a very small sum, can get all the bathing facilities they require at all times of the year. If a city is to be great and beautiful it must be clean, and no city can be clean if a large proportion of its inhabitants are dirty. Public baths on an adequate scale should be provided in all our chief centers of population. The absence of these institutions places an American city in unfavorable comparison with those of ancient Greece and Rome, and even the Oriental cities of to-day, in which public baths were regarded as an essential feature of city life. It is somewhat strange that while millions of dollars are being given by our rich men for the founding and support of educational and charitable institutions, the cause of decency, which could be so greatly promoted by the building and endowment of public baths, does not seem to appeal to these philanthropists.

Our Enormous Steel Production.

Every one connected with the steel industry expected that the statistics of the production of open hearth steel for 1901 would reveal a very large increase. But we question whether many realized how rapid had been the development last year. The American Iron and Steel Association have just published the figures from which we present below a table giving the production of Bessemer and open hearth steel ingots for a series of years:

Production of Steel in the United States.—Gross Tons.

Year.	Open hearth ingots.	Bessemer steel ingots.	Total.
1895	1,137,182	4,909,128	6,046,310
1896	1,298,700	3,919,906	5,218,606
1897	1,608,671	5,475,315	7,083,986
1898	2,230,292	6,609,017	8,839,309
1899	2,947,316	7,586,354	10,533,664
1900	3,398,135	6,684,770	10,082,805
1901	4,656,309	8,713,302	13,369,611

There has, therefore, been an uninterrupted increase in production of open hearth steel, which has quadrupled since 1895 and which promises to show a further striking development during the current year. It is well known with what feverish activity new open hearth steel plants, large and small, are being built all over the country, and what interesting developments are going on in this branch of steel making, metallurgically and mechanically. So far as Bessemer steel manufacture is concerned, no new large plants are under construction, since the great Buffalo plant may be regarded as a substitution for the dismantled Scranton works. Of course Bessemer steel capacity has increased in recent years in spite of this, but this has taken the form of strengthening and remodeling the older works. There are many who confidently assert that open hearth steel is now being made more cheaply than Bessemer metal, but the question of cost is so much dependent upon local and upon passing phases that it is impossible to generalize.

The most striking fact, however, in the figures now available is the tremendous output of steel in 1901, which in all probability will be largely added to during the current year. That this country should since 1895 have more than doubled its output of steel, and should be actually importing foreign metal although making steel at even a greater rate than the 1901 figures reveal, is eloquent proof of its enormous consuming capacity.

Steam Engineering and Sheet Metal Scholarship.

Joseph T. Ryerson & Son of Chicago, Ill., announce that, in grateful appreciation of the prosperity which has attended the house since their establishment 60 years ago, and in memory of the founder of the house, they stand ready to contribute $1500 a year toward scholarships or other sources of knowledge, dealing with steam engineering and the fabrication and erection of sheet metals in all forms. The benefit of this donation they desire should be available alike to the ambitious rivet boy and the journeyman who would rise from the ranks equally with the son who would succeed his well to do father. The details necessary for the wise use of this generous offer have not yet been perfected, but the company are sure that they will soon be able to adopt some plan to make the Ryerson scholarship a means of inspiration and benefit to many young men in years to come.

In the early pioneer days of boiler manufacture in the West, Joseph T. Ryerson of Chicago was one of the leading figures of the industry, and was often found a wise counselor and friend to many young men starting out in business. Thus the proposed establishment of a scholarship of the nature indicated is a fitting tribute to his memory on the part of his successors.

THE NEW YORK STOVE TRADE.

Already the advance in iron and molders' wages has had the effect not only of stiffening up prices somewhat, but also of creating a tendency on the part of the members of the stove trade to act in concert in regard to prices on some lines of goods. The agreement as to the price of builders' ranges which was reached during the administration of the late association has been reaffirmed, and some even claim that this schedule of prices is too low, and that they are getting higher figures for their goods. As yet no such action has been taken in reference to the general line of portable cooking stoves and ranges and the goods that are more generally handled by the out of town trade. In view of the advance in the price of pig iron and in wages, however, many manufacturers find the necessity of making independent advances on some of their goods. This course, while independent, is found on investigation to be quite general. With the near approach of the convention of the National Association the course pursued by the manufacturers in other districts in advancing their goods 5 per cent. is not without its effect in the local market, and it is not difficult to discover a strong tendency toward higher prices. The scarcity and higher prices of iron and the increase in molders' wages have also had some influence in the withdrawal from the local market of some of the outside competitors who have heretofore formed a very effective disturbing element. As yet the prices prevailing on the general line of stoves and ranges have not reached the level that has been established in other sections, where the manufacturers have been able to eliminate the disturbing factors and pursue a more harmonious course of action.

THE PHILADELPHIA STOVE TRADE.

Satisfaction is generally expressed by both manufacturers and dealers as to the existing condition of the stove trade in Philadelphia and vicinity. Large sales of spring and summer goods have been made, but deliveries have been somewhat delayed by the manufacturers. A few warm days is all that is required to start the early retail trade and to bring out orders for deferred shipments. Dealers are said to have bought more heavily in their initial orders this year, owing no doubt to their experience last season of delayed shipments, and, in many cases, the total impossibility to get goods on renewal orders. With the present prosperous condition of the country, it is expected that the sales of gas and oil goods this season will exceed those of any season heretofore.

Manufacturers of cast goods are looking forward to a profitable business, and the indications favor that result. Some hesitancy and no little uncertainty, however, have been noticeable owing to the more or less constant rumors of consolidations among the manufacturers. Combinations have been made—on paper—time and time again, but, so far, they have lacked the element of a satisfactory conclusion. This has its effect on the trade, and dealers are beginning to wonder what will happen next and who will be the parties to combine. At this time rumors are current of the amalgamation of several manufacturers which may not be without some degree of truth, but authentic statements are not obtainable. The various foundries are reported to be quite busy, and some new goods will be offered the trade before the season is fairly on.

A large quantity of heaters and ranges will be required this season for the building operations in the city of Philadelphia, which, one of the prominent dealers advises us, will be the most extensive for several years, there being a most active demand for new houses in many parts of the city. Prices in most lines have advanced, but there seems to be no great objection to the same on the part of the buyer, the fact being evident that prices of raw materials are higher, while the recent increase in wages to the molders has increased the cost of the finished article. Consequently the advances made by the manufacturers are taken as perfectly legitimate.

The Late William J. Carton.

As briefly announced in our last issue, William J. Carton, formerly president of the Carton Furnace Company of Utica, N. Y., died at Colorado Springs, Col., on April 3, as the result of a fall from his carriage. While driving a spirited team the horses bolted and Mr. Carton was thrown heavily against a barn, his skull being fractured and his neck broken. For some years past Mr. Carton, upon the advice of his physician, had passed his winters at Colorado Springs for the benefit of his health, returning in the spring to Utica, where he spent the rest of the year. He was born in Utica 45 years ago and was educated in that city. Later he entered Seton Hall College, at South Orange, N. J., and after graduation entered the furnace business, which his father had long conducted in Utica. On his father's death, in 1881, he purchased the furnace patterns from the estate, formed a copartnership with John B. Jones, and carried on the business under the name of W. J. Carton & Co. In 1883 his brother Edward entered the company, who were then incorporated under the name of the Carton Furnace Company, with W. J. Carton as president. The company, in 1898, were merged with other concerns in the International Heater Company. Seven years ago Mr. Carton was stricken with a serious illness, which compelled him to relinquish a large share of his business activity. He resigned the presidency of the Carton Furnace Company, being succeeded by his brother, Edward A. Carton, but retained the offices of vice-president and treasurer, and continued his financial interest in the concern. The remains of the deceased were brought to Utica, and the funeral services were held from St. John's Church on Tuesday, April 8. Mr. Carton inherited much of the executive and business ability of his father, and, had his health permitted, would undoubtedly have become quite as active a factor in business as was his father. He was never married and leaves three brothers—John F. and Matthew of St. Louis and Edward A. Carton of Utica.

The Century Stove & Mfg. Company.

A new industry at Johnstown, Pa., is the Century Stove & Mfg. Company, recently incorporated, with a capital of $100,000. The directors of the new company are: Rowland S. Wilson and Robert Monroe, both of the Reinecke-Wilson Company of Pittsburgh; Edrick C. Warren of Cleveland, Ohio, and John H. Waters and Samuel B. Waters of Johnstown. Mr. Wilson will be the president of the concern and Mr. Roberts secretary and treasurer. The new company will manufacture all kinds of gas cooking and heating stoves, gas hotel ranges, gas burners, and a variety of stamped sheet metal specialties. They will also do all kinds of electroplating and japanning, and will be in a position to carry out contract work in sheet metal and stamping for inventors or manufacturers who require work of the kind. The company are adapting a former wall paper plant in Johnstown to their purposes. It is said that the Century Company have over half of their stock subscribed, a large number of citizens of Johnstown having become interested in the enterprise. About 75 hands will be employed at first, which number is expected to be largely increased in the near future. The necessary machinery and equipment are now being placed, and active operations will begin as soon as the plant can be completed. The main building is of brick, 60 feet wide and 300 feet long, with the boiler and engine house adjoining. A railroad siding connects with the plant, which provides good facilities for the handling of the raw material and the finished product. The ground on which the factory stands is large enough for extensions when such are rendered necessary. E. C. Warren, who will be the manager of the plant, has been for a number of years manager of the Dangler Stove & Mfg. Company's works at Cleveland, Ohio. John H. and Samuel B. Waters, who are directors of the company, are also connected with the National Radiator Company.

THE IDEAL STOVE FOUNDRY, Daleville, Ind., was recently damaged by fire to the extent of about $10,000, most of the company's patterns being destroyed.

A PLEA FOR PUBLICITY.

Doubtless opinions will differ as to the propriety of the suggestions given below, although they are made by a successful stove manufacturer who has all his life been prominently connected with the stove trade, and who does not lack experience to ripen his judgment. The contribution is presented in the interest of those who may favor the general proposition. It would seem, however, that in many instances an open meeting would stop the discussion of matters of most vital interest to stove manufacturers alone, and which, are necessarily of a private nature. The greatest benefit derived from meetings of business men is perfect freedom in the interchange of views, and while it may be true that many of their sessions could be open without disadvantage, there can be no doubt that the members of any association and its officers are the best judges of whether or not it is best to conduct their proceedings in the presence of the members only. The communication is as follows:

In these twentieth century days anything that savors of Chinese methods of mystery and concealment should be banished. Civilization of late has been treated to the inside workings of that great empire, which are most unfavorable to its policy. The National Association of Stove Manufacturers, a number of years ago, inaugurated similar methods of concealment regarding their proceedings, and have continued them down to date. How much benefit has been derived is known to them only, but it has probably been of the same character as that secured by China over the other nations. Objections were originally made by some manufacturers to having small makers come in with them, because they would be likely to profit by their long experience, &c., which they claimed had cost them money. "Let them pay for theirs," was about the expression. This objection has passed away from the fact that it is proved better to educate the inexperienced on good business methods than to let them pursue a wrong course.

It is not meant by this that all the elders know the right way; but there is positively a fund of solid facts accumulated in a business career, and there is a code of unwritten laws that execute themselves as inexorably as the natural laws do. It can be pointed out that exceptions are largely quoted against such experience; neverthless, the solid facts accumulated in business never have and never will lose their value to those who will consider them. Some of the experienced have the faculty of imparting this knowledge to their juniors in a mode that sinks deep and will bear fruit. Others think that only they know it, and in a mysterious manner cloak and wrap themselves up in their concealed wisdom. But the fact still remains that only time can enable me to accumulate those experiences. A young lawyer may bring out a chain of statements that will convince a jury, until the older, experienced lawyer draws from his long accumulated store of facts a few real cases and sweeps out his less experienced brother who had never heard of such cases.

As a fact every man who deals in stoves is interested in all that appertains to the business, and should be kept fully posted regarding its general affairs. It must be stated that it would not be expected that dealers should have the entire facts regarding costs, &c., in producing stoves any more than they would want their customers to know their costs, &c. The stove industry to-day is greater than ever in its history, and demands a high order of talent to run it—and it is getting it. Because a man as a molder or a tinner is not enough to qualify him for the race. The outside of the shop contains the things unseen to-day. As the matter now stands, nothing much reaches the attention of the dealers except what comes, perhaps, from the traveling men, and his information may be somewhat uncertain, as it is likely that most of it is second hand.

A manufacturer returning from the meetings will converse in his own office about what he has heard, and, naturally, it will be of whatever kind the impressions may have made upon him, favorable or not. Those around the office hear many of these remarks, and perhaps the traveling man, when he drops in, gets the ideas, and, in his turn, he may convey them to his customers. With a full and free publication of all proceedings, except those stated, no possible harm could happen, and perhaps much good might arise. It would certainly remove from the minds of the dealers the impression that he was the only target the association was firing at.

Whether China will continue in her policy is not fully known. Neither is that of the National Association. But the verdict of civilization is against the former, and if any one believes that the trade can be hoodwinked by secretive methods they are greatly mistaken. The trade should have full and accurate information on all subjects connected with it, and one source of such information should be the meetings of the National Association of Stove Manufacturers. Although it does not follow that much might be learned from them, as it is now, whatever there may be is not permitted to reach the trade. Censored news may be necessary in war, but not in peace. Let us have publicity.

Ideal Gas Stoves and Ranges.

We have received from the Ideal Mfg. Company, Detroit, Mich., a copy of a remarkably attractive catalogue and price-list which they have issued for the season of 1902, covering the Ideal gas stoves and ranges, which are manufactured in many styles and varieties. The work consists of 64 pages of letterpress, profusely illustrated and printed in two colors. The illustrations are for the most part well executed half-tones, showing the ornamentation with remarkable fidelity, the effects being produced by contrasts of nickel plated parts with the black surfaces. The front cover is embellished with a bird's -eye view of the company's works and two automobiles, the leading one of which bears the name Ideal. Beneath the picture is the inscription, "Always in the Lead." The early pages are devoted to an illustrated description of the Ideal Common Sense range, which embodies the modern features and is offered in several styles and sizes. Following this are several pages devoted to high-class special grills and outfits for club, *café* and grill rooms, or residences. The illustrations show the outfits installed in position for actual use, and prices are given of the cost of each equipment. The Ideal end broiler is next in order, after which comes the Ideal cast front drop door series in its various modifications and embodying the modern improvements. This is followed by the Ideal swing door cast front series and then by the Ideal steel front series. The latter is intended to care for the wants of a moderate home. The doors are made durable by being mounted on neat cast frames that close snugly against jambs of No. 14 steel. The concluding pages of the catalogue are given up to illustrations of the Ideal Independent gas broiler, the Ideal hot plate with combined oven and hot closet and the Ideal Independent water heater. A table of contents is convenient for reference.

A. L. Canfield's Showroom

The stove dealer who visits the stove salesrooms of A. L. Canfield, 284 Pearl street, New York, will be pleasantly impressed with the attractive character of their new arrangement. The floor of the main office has been covered with a handsome carpet, the side walls and ceiling have been newly papered, and Mr. Canfield has built a very convenient private office for his personal use. The goods displayed at this season are not less attractive. A line of the Detroit Jewel gas stoves and ranges are shown that are well adapted to meet all the requirements of the trade. The Monarch line of blue flame oil and gasoline stoves of the cabinet style in both the high and junior grades with broilers and ovens leave little to be desired by those who make a push on these goods. The Beaver ranges for coal have already become well known from their handsome design, finish and trimmings, as well as their excellence in operation. These are but a few of the many money making leaders that the visitor will find of interest.

THE SCRANTON STOVE WORKS, Scranton, Pa., who have been very busy, have granted their entire force of employees a 5 per cent. increase of wages.

THOUGHTS FOR THE CONSIDERATION OF FURNACEMEN.

BY IOWA.

It is a pleasure to me that considerable thought has been aroused among furnacemen by my article presented in *The Metal Worker* of March 8. I have received a number of letters on the subject from different parts of the country and one from Canada. Furnacemen ought to be stirred up to think for themselves. I am of the opinion that they should think along different lines and get themselves out of the old ruts. There is need for a complete reformation in furnace building. Furnacemen do not have the opportunity to profit by what they learn in their experience. The reason for this is that the manufacturers of furnaces do not have to carry the responsibility of making the furnaces work satisfactorily; consequently, they are not conversant with either effect or cause. Manufacturers sell furnaces all over the country, and if something goes wrong and the furnace is unsatisfactory the poor fellow that puts it in has to suffer and not the manufacturer.

There are many things that need to be substantially changed for the better in furnace making. Furnaces can be made of cast iron that are perfectly gas tight, and remain so for several years. But unfortunately they are not made that way. Most of the constructions that have appeared in the past 40 years are of the same type. The closed jacket methods of handling air are bad and ought to be changed. Every furnace ought to be set in brick and have the heating surfaces differently arranged. If furnacemen will study closely they will find advantages to be derived from the horizontal movement of air over horizontal heating surfaces in a furnace that are not to be obtained from the vertical movement. We will not reach such a revolution in construction until furnacemen have studied the philosophy of heating a little more and see the nature of the mistakes that have been made quite generally all over the country in furnace heating.

In reference to the article referred to and the inquiries and criticisms I have received I will state that I have no axe to grind and only desire to give my experience and the result of my investigations to people who are anxious to know. To those writing for further explanation as to the "rotary method" of handling the air I would say: Read the article again carefully, as it suggests the method of proceeding.

VENTILATION FAVORED.

In reference to the article of "R. R. M. C." I would say that he writes criticising what is *not* our method in school house and church heating. We *heat* the school house or church by the rotary method previous to the assembly of the scholars, but, when they are gathered some system of ventilation must be used. We pass the outdoor air through our heating oven into the building, thus securing abundant ventilation and providing moderately warmed air from out of doors. We adapt our heating to the ventilating method we use in the school house. The fundamental idea here is that heating and ventilating are two different things, and one must not be sacrificed to the other. Let every man put a peg down here and hold to this as one of the fundamental truths. It will work a revolution in many plans for heating. A school house can be best heated by this rotary method, but it must be applied with common sense.

CARBONIC ACID GAS DIFFUSION.

Again "R. R. M. C." says: "'Iowa' speaks of ventilating registers near the floor as wrongly placed." Again he misunderstands. Circumstances may make that the best place in some buildings. What we claimed was that such ventilators placed there to carry off the carbonic acid gas were wrongly placed. Now we are after the truth. Put a peg down here and fasten another truth. Carbonic acid gas does not settle to the floor, notwithstanding 100,000 writers on science and ventilation have said so. And when our friend says: "It, being heavier, will most assuredly fall to the floor," he, like thousands of others, is following one of the innumerable delusions that are humbugging the world. Mark these facts: Carbonic acid gas though specifically heavier than the air at the same temperature is lighter than air at a higher temperature. It comes from the lungs at a temperature of 98 degrees and moves into the upper atmosphere of the room along with the heated breath. There the law of diffusion of gases takes hold of it. It mingles with the warm upper air. That air, contaminated with bad breath and carbonic acid gas, is hiding in the upper part of the room, while the scientists, philosophers and health seekers are busy trying to trap the bad air at the floor, where the good air of the room is almost sure to be found.

MOVEMENT OF AIR IN ROOMS.

Some day ceiling ventilation with valved outlets under control will be in universal use in school houses and churches. We have caused many of them to be used and always with success. Here, then, is a chance to peg down another truth. Hundreds of plates have been printed showing the movements of air in rooms—most of them portraying the brain chambers of the writer rather than what is really taking place in the rooms. Let us get at some fundamental truths here. Where rooms are heated from furnaces, indirect steam heating, &c., the strata of air in the rooms lie horizontally like oil and water—the warm air above, the cold air below. Wherever and however the warm air may go into the room it goes immediately to the ceiling. This is the rule everywhere, subject to some modification at times. It makes very little difference as to whether the warm air comes through the floor or through a register 8 feet from the floor. Exhausting from the floor takes the cold air away, brings the warm air down from the ceiling, just as water would be taken from under oil, where a room was half filled with each. All of the water would be drawn off through a floor opening before any of the oil would be drawn off.

THE ROTARY SYSTEM.

Just so with warm and cold air, and on this principle the rotary method of the Campbell Furnace Company is based. The cold air is drawn down—the warm air comes down with it—no cold air is allowed to accumulate on the floor; there is a continual downward movement; the only method of air circulation that secures thorough circulation and distribution of the heat. There are no currents of air. It is a still movement. We have never yet found a building in which the rotary air movement could not be used to great advantage.

SOME THOUGHTS ON CONSTRUCTION.

Another point at which we have made a radical change is the movement of the air over the furnace. Commercial gain—not the good of the heater—originated the galvanized iron jacket with its vertical air movement. The faults here are numerous. Some of them are as follows:

1. The air is often held too long on the furnace and becomes overheated, dangerous, burns the dust and has the burnt air flavor.

2. Very often all the air is heated by the hot fire bowl, the upper parts adding no heat to the air. If the air was coming horizontally upon the furnace each part of the furnace would get its own cold air as a stove does, and the air could never be heated to over about 225 degrees. It would fly away from the furnace before it could be overheated and more cold air would rush in. Thus a given amount of fuel would do a great deal more work and the furnace would not be burned out so rapidly. It is a bad plan to multiply heating surface vertically.

3. By the close jacket air movement a great part of the heat radiated through the furnace is lost. Heat is an effect, not like common potatoes. The effect must be caught by all the cold air that can possibly be thrown upon the furnace. Water will carry off all the heat that radiates through the boiler sheet; air will not; hence the furnace becomes red hot. The lesson from this is: A furnace must not be crippled in its air movement. Give it all the air it will take. Let it come to the furnace in abundant measure.

E. H. Rider of the Stanton Heater Company, Martin's Ferry, Ohio, is visiting G. R. Mokel, their agent, at St. Joseph, Mo., to assist him in closing some large contracts for the Stanton Hot Air Furnaces.

FUEL GAS AND GAS APPLIANCES.

At the annual meeting of the Ohio Gas Light Association, recently held at Columbus, Ohio, President Henry L. Doherty, in his address, discussed subjects of interest to the gas stove trade. The following extracts from his address are presented for the information of our readers:

I consider fuel gas, in its universal sense, to be out of the question, or at least until some method for the cheap production of oxygen shall have been found. While a field of enormous dimensions already exists, the acquisition of this business rests almost entirely with the wisdom and ingenuity of the designers of our fuel gas appliances. The sale of gas which contains 650 B. T. U. at $1 per 1000 cubic feet for heating purposes is equivalent to selling heat energy at about $1.54 per 1,000,000 B. T. U., this in turn being equivalent to about $53 per ton for good bituminous coal. To make a reduction in the selling price of gas which would even in a measure compensate for this vast difference in cost to the consumer of heat energy is simply out of the question, and our only hope lies in perfecting our fuel gas appliances.

Our gas appliance business is in a crude condition, in spite of the fact that so-called satisfactory results are often obtained with most of the appliances which we use. Satisfaction, after all, is a relative matter, and we should aim to have the best rather than to have something which is merely a little better than was used a few years ago. I have never seen any tests of fuel gas appliances which were at all comprehensive or conclusive. Enormous opportunities for inaccuracies always exist, and the work has generally been done by men who have not taken the trouble to study the laws of heat and combustion. While it is generally an accepted fact that every fuel gas appliance has some favorite rate of gas consumption at which most economical results will be obtained, yet none of us have ever made this a subject for special research work, or at least not to my knowledge. I might cite as an example our present water heaters. I not only criticise their manufacture, but I also criticise their method of installation. I know of nothing which would so increase our business as our ability to obtain and install a water heater which would have a working efficiency beyond that now obtained, but which is not impossible with the present existing prices of gas and the knowledge of the engineering problems involved. At present we must contend with several causes of inefficiencies in independent water heaters, as follows:

Different rates of gas consumption, irregular drafts, radiation from boiler and piping, and radiation from water heater when not in use.

Radiation from boiler and piping can be partially prevented by an insulated covering on the boiler. Irregular drafts can be practically overcome by the use of a broken length of flue pipe with a canopy above it. The draft in your chimney must constantly change, due to the intermittent use of the water heater, or due to other appliances using the same or adjacent flues. If the draft is excessive more air is drawn through the heater than is needed to support combustion, and the heat absorbed by this excess air is net loss. As the flow of gas varies only as the square root of the pressure, and not directly in proportion to changes of pressure, the efficiency of the heater is not much affected by a slight change in pressure, and we could obtain fairly economical results if the heater were so arranged that whenever it was turned on we would get approximately the most favorable rate of gas consumption. This could probably be done only by the use of some sort of stop cock which could only be in the position of "full on" or "entirely off." Radiation from the heater itself is a serious matter, since being connected with the flue it continues to induce a draft even after the gas has been turned off, so long as the water is at a temperature higher than that of the air. This causes cold air to come in contact with the coils of the heater, and as soon as the water contained in these coils is cooled it drops to the bottom of the heater, and the hot water comes over to take its place and in turn is cooled and drops to the bottom. If you will stop to think for a moment you will see that the circulation in your heater reverses when you turn off the gas. I think this loss could be most easily prevented by so arranging a gas stop cock that both the gas and the water will be turned off and on at the same time. With such a stop cock on the water pipe no circulation would take place, and only the heat contained in the water in the coils of the heater would be lost. I cite this merely as an example. The same general criticisms are applicable to almost every other appliance which we use. A good water heater would not only give us the gas consumption of that water heater, but would put hundreds of gas ranges in constant use. Cheap gas stoves for the heating of rooms have materially curtailed our opportunities in this line. A gas heating stove, to be extensively used in an ordinary climate, must have a flue pipe which will discharge out of the room the vapor of water and the CO_2, and as little as possible of the heat generated by combustion. I am not afraid that our combustion is not complete, and I see no particularly harmful effect from a much larger percentage of CO_2 in the air than we are likely to get, but I am afraid of water vapor. CO_2 is as inert as nitrogen, and if any CO is produced it is in too insignificant a quantity to be considered. I doubt if the burning of 50 feet of gas per hour in a room, in even a very crude heating stove, would produce as much CO as would result from the smoking of one cigar.

I think we must change our methods to make ordinary gas heaters satisfactory. I think that eventually we will aim to develop the maximum quantity of the heat of the gas in the form of radiant energy, which travels without regard to the laws of gravity, which can be directed and controlled, and which warms the body and the furniture without expending itself entirely on the atmosphere of the room. To get a large percentage of radiant heat we must burn our gas at a high flame temperature, and direct the heat of the flame on some medium which will enable it to give off all excess heat in the gas above a certain temperature in the form of direct heat rays. This result could probably best be arrived at by the use of recuperative flues, which will deliver the heat in the outgoing gas to the incoming air and gas.

Desirability of Developing a Market.—I do not want to omit to answer in some way the charge which is frequently made that the engineering branch of our business is falling into neglect, owing to our entire efforts being devoted to the problem of selling gas. I do not think this charge is well founded, and I think none of us are more anxious to sell gas than is warranted in the light of recent experiences. It is not a difficult matter to double the earnings of a company by developing the market, and it most certainly is impossible to double the earnings of any ordinary company by improving its operating conditions, no matter how much time and money are so expended.

Personally, I do not believe in free service pipes, I do not believe in giving away gas stoves, and I do not believe in selling gas stoves at cost. I think the problem which confronts us is one of how much money we can afford to spend to increase our consumption, and how can this money be expended to give the greatest increase in consumption. I believe that the greatest increase in consumption can be obtained by expending this money to make people want stoves, and I also believe that you can make these people help carry along your campaign, when once you have made them want a stove, by paying you more than it cost you. There is a general and prevalent idea in the gas business that the main reason why people do not use gas for cooking is the obstacle of first cost, Now if this reasoning is proper and sound everybody in towns where gas stoves are free would immediately put in a gas stove, and yet in some towns where stoves have been given away there are not as many in use as where they have been sold. This fact is unquestionably an absolute proof that the main obstacle in putting gas stoves in use is not their first cost. The question of how to make people want stoves is one largely of opinion. I think, as a general proposition, and with the proper funds at your disposal, it is safe to work every avenue that you do not think ineffective. In other words, take advantage of every opportunity that offers, even though it might be unpromising. Time will be apt to demonstrate the worth of every opportunity at a small cost.

Personal solicitation always seems to be most effective, but advertising is really another form of solicitation, and your solicitor may not be able to get an audience with people that your advertising will reach. I never heard of any one buying a stove on advertising alone, and yet I am confident it is impossible to get superlative results without advertising, and it is a simple form of solicitation that is methodical, cheap, systematic and persistent. Your advertisement is a written solicitation, and presumably written by an expert. It can approach people whom you cannot reach in person, can enforce attention without irritation, appeals to your prospective consumer in all sorts of humors and in all stages of "business," and if persistently followed up will some day strike that prospective consumer when he is in a receptive mood, and he will at least give your solicitor an interview when he next calls. While, as previously stated, I do not think it possible to stop the practice of putting in services free when once it has been established, yet where services are being put in free every protection should be taken to reserve their ownership by the gas company, so far as possible.

The Round Oak Steel Range.

A gorgeous publication has just been issued by the Estate of P. D. Beckwith, Dowagiac, Mich., which deals exclusively with the Round Oak steel range. The book consists of only eight pages and a cover, but is of a character calculated to enlist more than ordinary attention. The pages are large, being 10 x 12 inches in size. The cover is an imitation of brown linen, and bears a silhouette illustration in colors of an Indian, presumably Doe-wah-jack, lighting a pipe. The reflection of the flame lights up the face of the Indian, bringing his classic features out in strong relief. The illustrations in this book are of half-tones and are perfect pictures. They show the range almost as well as if the article itself was on view. Most of them are so large that they cover a full page. The range is shown in all the various styles in which it is constructed, comprising square, with high shelf, with high closet, with high shelf and end reservoir and with high closet and end reservoir.

The Round Oak steel range is claimed to be a perfect range in every particular, distinguished in each detail by the highest quality. The body is made of 18-gauge hammered polished steel, and is bluish black in color, requiring little labor to keep it clean. The corners of the body are simply a plain bend with no break in the sheet, no castings and no rivets. This requires a very high quality of steel sheet and is somewhat harder to make. The high warming closet has a round rolling door with a perfectly flat top, making it a smooth, convenient shelf. Under this closet are monogram tea shelves, which can be folded up flat against the back when not in use. A broiling door is placed on the left end of the range, which can also be used as a feed door when burning coal. The range has two draft slides, one on the end underneath the broiling door and the other under the ash pit door. A drop door on the end of the fire box opens level with the grate, preventing ashes from dropping on the floor when using wood. The oven door is perfectly balanced with an iron weight located in a well between the ash pit and the front of the oven. The grates are combination wood or coal, which can be quickly taken out and replaced without disturbing the back, front or end linings. Two end linings are furnished with each range. The fire box has an extension on the rear end, which permits the use of 26-inch sticks, if desired, when burning wood. The bottom of the exit flue on the back of the range is protected from rust by a heavy cast iron elbow. Cast iron is used for this purpose, as creosote or dampness would destroy this flue if made of sheet steel.

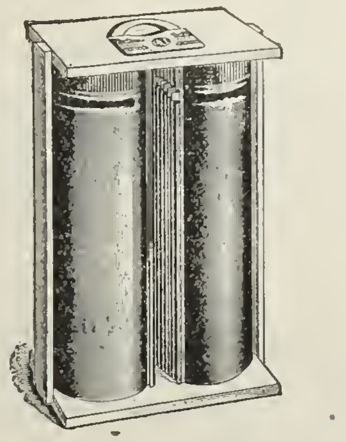
The range has an independent cast iron base, which is an improvement introduced this year. The base not only adds to the appearance of the range, but enables it to easily pass through any ordinary door. Heavy asbestos insulation is used in the construction of the range. The statement is made that the amount of asbestos used is from two to three times as much as is ordinarily used in a steel range. The reservoir is made of cast iron, white enameled, is extra large and has a round bottom from which almost the last drop of water can be dipped out. The water front furnished with this range when desired is a combination of malleable iron and pipe, and is an original construction devised by the manufacturers. This water front does not interfere with the use of the broiler door. The ornamentation of the range consists of polished nickeled work, at once plain and rich in design. A massive polished nickel rail is placed along the edge of the top in front of the range.

New Process Gas Ranges

The Standard Lighting Company of Cleveland Ohio, are sending to the trade a special catalogue devoted to the New Process gas ranges. The book is printed in black and green and profusely illustrated with half-tone engravings showing the various styles of New Process ranges and also their construction. A broken view is given of the Tangent Star burner, which is said to be durable and to promote combustion and generate intense heat. A broken view of one of the New Process gas ranges shows the movement of the air and products of combustion in the broiling oven and the baking oven, also the method of insulating with air spaces and asbestos. A picture shows the various parts of the stove unassembled, indicating how readily it may be taken apart for cleaning. In addition to the gas ranges, broilers, water heaters and hot plates are shown.

Yale Patent Lock Stove Pipe.

Hemp & Co., St. Louis, Mo., are manufacturing the Yale Russia finish patent lock stove pipe, here illustrated. The pipe is swedged and crimped so that it can be easily put together by any one, by merely pressing in the key, which securely locks it without the use of hammer or rivets, the manufacturers asserting it is impossible for this lock to slip or tear when putting it together, or after being made up. It is made of a high grade of uniform color Russia finish steel and coated to prevent rust. The feature of this construction is referred to as the great saving in freight on account of the small compass required through nesting. The pipe is paper wrapped, put up in crates containing 25 and 50 lengths, and is made in 5, 6 and 7 inch sizes, they being prepared as well to furnish all sized tapers.



Yale Patent Lock Nested Stove Pipe.

ODD PLATES.

Manager Taylor of the New York office of Isaac A. Sheppard & Co. of 312 Pearl street, has recently rearranged his showroom and provided newly painted platforms on which the Excelsior and Fidelity Ranges and Paragon Steam and Hot Water Heaters make a very attractive showing.

The Cope Pattern Works, Detroit, Mich., have decided to make an important improvement in their factory at 36 Brush street, corner of Woodbridge street. They will erect a building 31 x 60 feet and three stories high. The Brush street factory will then be of sufficient size to accommodate the company's entire business at one place, and the addition will also considerably increase their capacity. They have been doing a portion of their work at Randolph and Atwater streets, in a building which they have occupied for 11 years. The company are manufacturers of high grade Stove Patterns of every description, as well as Patterns for furnaces, hot water and steam boilers, radiators, &c. The works comprise filing, fitting and followboarding departments and a metal pattern foundry.

M. M. Corwin, 256-258 Water street, New York, has taken the agency for the Repairs for stoves made by the Thomas, Roberts, Stevenson Company of Philadelphia since that concern closed their New York branch. A full line of the Repairs for the Active Fortune Stoves and Ranges will be carried in stock for prompt shipment.

A license of incorporation has been granted to the Enterprise Stove & Sheet Metal Mfg. Company of Quincy, Ill. The capital stock of the concern is $65,000, and the incorporators are Harry F. Baker, Frank S. Seger and Henry C. Baker. The purpose of the company is to manufacture Stoves and Sheet Metal Goods. Local newspapers state that the capital stock is subscribed, and it is expected that the company will be in operation in a short time.

The United States Register Company, Limited, of

Battle Creek, Mich., manufacturers of the Jones Side Wall Warm Air Registers, will be represented by the following able corps of salesmen during 1902: Robert Jagers, who for years represented the Giblin Furnace Company, will look after their interests in New York and the New England States; H. B. Van Buren, a recognized expert on heating and ventilation, in Pennsylvania and Ohio; C. E. Blanc in Indiana and Michigan, and Fred. Redner in Illinois and Iowa. R. J. Schwab & Sons Company, Milwaukee, Wis., their Northwestern distributers, will look after the Northwestern trade through their own staff of representatives.

J. D. Smith Foundry Supply Company, Cincinnati, Ohio, are sending out a complete catalogue and price-list No. 10 of their business as manufacturers of all kinds of Foundry Facings and Blackings, importers and refiners of Plumbago, Silver and Black Lead and manufacturers of and dealers in supplies for iron and brass foundries, pattern makers, machinists, rolling mills, &c. Since issuing their No. 9 catalogue they state that they have added a number of good things to their line. They also refer to their capacity as enabling them to meet the demands of the trade efficiently and promptly.

The Caldwell Furnace & Foundry Company, recently incorporated under the laws of New Jersey, have acquired title to the furnace and foundry building formerly occupied by the Smead Company, on the corner of Bancroft street and Smead avenue, Toledo, Ohio, which they have occupied for some time.

F. M. Borden & Bro., 118-122 North Second street, Philadelphia, are sending a neat four-page circular to the Stove trade giving a list of the houses for whose goods they can furnish Stove Repairs and other things in the way of supplies. They also carry an extensive line of Gas, Oil and Gasoline Stoves and Refrigerators.

Through an error we stated in *The Metal Worker* of last week that Chalmers Trimble, who has been elected a secretary of the Mason Heater Company of Bellaire, Ohio, had become connected with the Stanton Heater Company of Martin's Ferry, Ohio. We learn that T. J. Grier, who has been connected with the Stanton Heater Company has resigned his position to assume the position of superintendent of the installation for the Mason Heater Company.

The Michigan Vapor Stove Company of Grand Rapids, Mich., show a very attractive line of Gasoline Stoves in their new catalogue. One of the features of the Stoves is the special construction of the burner. The company state that they have received orders in excess of their producing capacity this year.

The Charter Oak Stove & Range Company, St. Louis, Mo., have recently issued to the trade a circular letter, calling attention to the small stock of pig iron on hand at the furnaces and in the yards of foundries, and to the fact that in many branches of labor connected with the Stove and Range industry wages have been advanced. Reference is made to the conference recently held between representatives of the workmen employed in the Stove and Range factories of the United States and their employers, at which the demand for higher wages was granted and went into effect on April 1. As a consequence of these conditions the company find it necessary to withdraw quotations heretofore made and to invite correspondence concerning ruling figures. They urge their customers to supply wants as early as convenient, as the stock of Stoves and Ranges in the hands of makers is small, and the opinion is expressed that if the crops are favorable this year the demand for goods is likely to be larger than the supply.

At a meeting of the stockholders of the Wireton Heating Company of Blue Island, Ill., on April 11, it was voted to change the title of the concern to the Quaker Mfg. Company, and to increase the capital stock from $50,000 to $100,000. Bids for the company's new plant at Chicago Heights, Ill., were opened this week. The company have arranged with a large Stove manufacturing concern to make their castings and have leased the Allerton lubricating plant, at Grand Crossing, Chicago, for the purpose of manufacturing their Furnaces, Time Regulators and Registers until the new plant is completed.

The plant of the Phillipsburg Stove Mfg. Company, at Phillipsburg, N. J., is reported to have been leased by Hobson & Co. of New York, who will shortly put the works in operation, manufacturing Machine and Stove Castings and Stoves.

Washington Stove Dealers' Association.

The annual meeting and banquet of the Stove Dealers' Association of Washington, D. C., was held on April 2, at their hall, 514 Ninth street. Previous to the banquet the following officers were elected for the ensuing year:

President, F. S. Hodgson.
Vice-President, W. S. Jenks.
Secretary, J. A. Pierpoint.
Treasurer, Charles Johnson.
Trustees: I. B. Dodson, T. Sauer, Henry Hammond, Joseph Maltby, W. T. Hutchinson, and A. S. Johnson.

After disposing of an elaborate *menu* a number of entertaining speeches were enjoyed by the diners. President Hodgson performed the duties of toastmaster in a graceful manner.

Show Window Lighting.

How windows should be lighted is a matter of grave consideration, especially in the winter time, says the *Drapers' Record* of London. Electric lighting has opened up great possibilities in this direction. We may, however, have too much of a good thing. The many miserable failures in this direction are plainly to be seen in most large towns. Occasionally one drops across a success.

A window seen recently was lighted solely by electricity at the top. Shades are so arranged as to cast down a flood of light on the goods in the window below. Instead of casting a flood of light on to the footpath, the lights nearest the plate glass front are shaded so as to throw the light inside, and right on to the goods. This is a great comfort to the window gazer—ofttimes a customer. Instead of the eyes being dazzled with the light, they can look comfortably on the stock displayed in the window. The goods stand out boldly, and can be surveyed like a shaded picture.

Another tradesman favors the lights being at the bottom of the window, nearest the glass, and shaded so as to throw the light upwards. In this case also the lights are shaded at the front, so that the shaded glare falls on the goods, and not on the eyes of the onlooker.

Some shops are one garish blaze of electric light, unshaded, or nearly so. These are pronounced successes where glare is wanted, but they are sad failures often as a means of selling the articles on view. People not accustomed to the new light cannot bear the unshaded glare, and so the object of the tradesman is not attained. Experts in these matters should be consulted. If the result is not successful another system of arranging the lights should be tried.

Ricinate Fire Proof Paint.

Richmond Supply Company, Richmond, Va., as sole agents, are calling attention to the Ricinate fire proof paints and kalsomine. The company claim that wood painted with Ricinate takes from 200 to 300 degrees more heat to set it afire than when painted with non-fire proof paint; that wood covered with it will not blaze when set on fire; and that Ricinate wears and weathers as well as, and costs little, if any, more than, high grade non-fire proof paints. The company issue a circular containing testimonials from manufacturing and other concerns who have used the paint. It also directs attention to their Dura Asphalta, which is referred to as a highly elastic paint for roofs of factories, warehouses and residences.

Marth & Gunderson, Neillsville, Wis., have added a Stove department to their Hardware business and desire to receive catalogues and prices from Stove manufacturers. They will handle a cheap line of Cooks and Ranges in addition to a leading line of high grade goods.

Clark's Gem Flue Stops.

Illustrations are herewith given of a line of flue stops recently placed on the market by the J. L. Clark Hardware Company, Rockford, Ill. The Gem flue stop which they have devised is designed to meet the demand for a flue stop simple in construction, capable of being easily and quickly put in place, and packing flat for shipment.

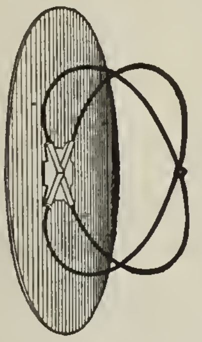


Fig. 1.—Flat Stop.

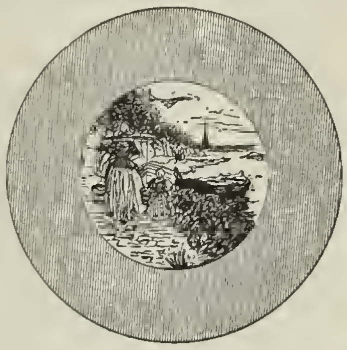

Fig. 2.—Front of Flat Stop.

Fig. 1 illustrates the method of fastening adopted for the higher grade of these goods. This consists of two wires, which are arched in form and cross at right angles to each other. These wires are notched at the point of crossing, thus locking them securely. In this manner, it is pointed out, four points of contact are secured instead of two, as is the case with most stops. Fig. 1 is a perfectly flat stop, which can be easily papered over if so desired. This is a novelty in the trade, as it is believed that a flat stop has not before been brought out. Fig. 2 shows the front of this stop, a neat design having been adopted for the purpose of ornamentation. Fig. 3 is a brass finish stop, raised and embossed, having an artistic chromo fastened at the center, as shown in Fig. 4. From the form of the wires the greatest holding power is secured. The socket for the wires is raised from the stock itself, which prevents any melting and dropping down, which is likely to happen when a cleat is soldered at the center. Fig. 5 shows the Crescent stop, which is designed to fill the demand for a cheap article which may be sold to the consumer for so small a price as 5 cents. The wire loop has been adopted, as the company have found from experience that it holds the stop in position in the flue more securely than a band. All the dies for the manufacture of these stops are of the latest design, and the blanks are stiff and rigid. The wire loops fold perfectly flat, thus facilitating the packing of the goods to occupy small space.

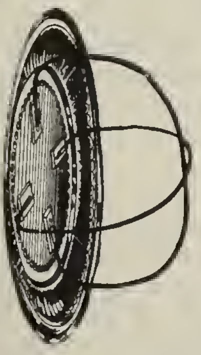

Fig. 3.—Brass Finish Stop.

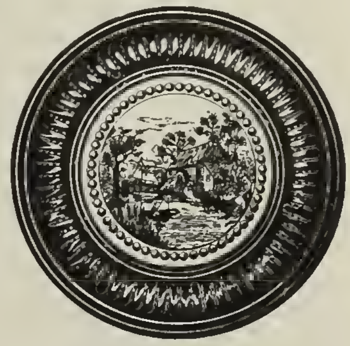

Fig. 4.—Brass Finish Stop, with Chromo.

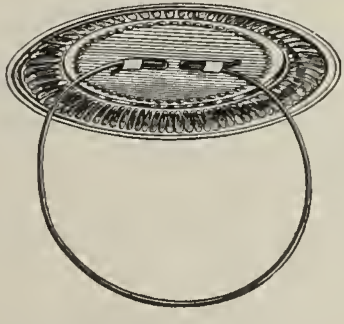

Fig. 5.—The Crescent Stop.

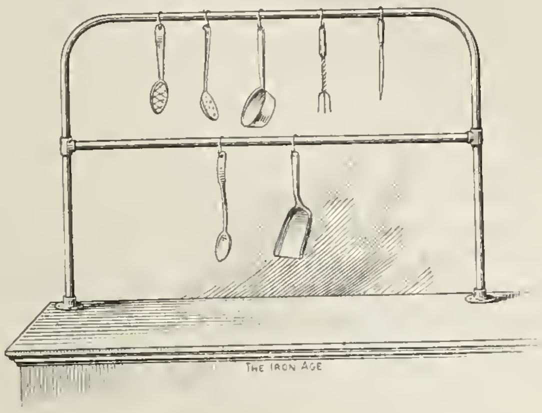
A PIPE RACK FOR DISPLAYING KITCHEN UTENSILS.

In the accompanying illustration is shown a rack made of 1-inch water pipe that is placed on the back of a counter in the store of Stark Bros., Stamford, Conn. From this are hung small kitchen and household utensils by means of copper wire bent with a hook at each end. This rack serves as a convenient way of bringing to the attention of customers a line of small articles that are frequently lost sight of in the store.



A Pipe Rack for Displaying Kitchen Utensils.

◆

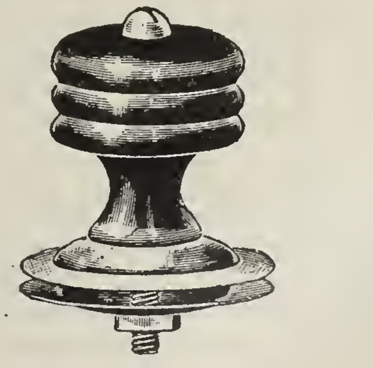
Herrick Refrigerators.

Herrick Refrigerator Company, Waterloo, Iowa, have issued a new catalogue of their Herrick (Northey's patent) sanitary refrigerators, ice chests, fish boxes, ice cream cabinets and cans, display cases and coolers, florists' cases, &c. In addition to making all kinds of family and other refrigerators, they also furnish butchers', grocers', creamery, hotel, medical and saloon coolers. For their refrigerator work they use odorless spruce, white enamel or white opal glass linings. They call special attention to their No. 2 enamel refrigerator, which they say never fails to make sales where the merchant gives it a place in his show window, and also to their white opal glass lining refrigerator for high class trade. The company give exclusive agency to one agent in each city on all sizes under No. 9, with the privilege of selling No. 9 and larger sizes if he can. They state that they are now building a large addition to their factory, 100 x 100 feet, which will enable them to take better care of their trade than ever during the season.

◆

Enameled Repair Knob.

Paxton Hardware Mfg. Company, Paxton, Ill., are putting on the market the enameled repair knob shown full size in the accompanying illustration. This knob is intended for use on lids of tea kettles, tea pots, coffee pots, &c., and by its employment, it is pointed out, burned fingers in handling these utensils may be avoided. The device comprises a good sized strong enameled knob and a 1½ x 5-32 stove bolt. The tin parts are neat and smooth. The knobs are furnished in bulk, in neat pasteboard boxes, three dozen to a box, and mounted on display cards, three dozen to a card.



Enameled Repair Knob.

Stove and Hardware Dealers.

Stratton & Terstegge, Louisville, Ky., are sending out a spring catalogue containing only such goods as they carry in stock and are suitable for spring sale. It contains 60 large pages, and covers Sewing Machines, Oil and Gasoline Stoves, Oil Cans and Tanks, Clothes Wringers, Washboards, Freezers, Preserving Kettles, Milk Utensils, Bird Cages, Water Coolers, Steel Goods, &c.

L. F. Holloway & Co. have engaged in the Hardware, Stove, Agricultural Implement, Plumbing and Tinsmithing business in Fremont, Neb., succeeding Hobbs & Jones. The new firm are making a number of improvements in the store and adding to the stock.

Womacks & Kirby have succeeded W. N. Womacks in the Hardware, Stove, Agricultural Implement, Buggy and Sporting Goods business in Blue Springs, Mo.

J. C. Scott, Roscoe, Texas, has bought the business of the Roscoe Mercantile Company and removed the stock to his establishment. Mr. Scott now deals in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

Henry Soule has disposed of his Hardware, Stove and Sporting Goods business in Trimble, Mo., to O. E. Conneil.

Foster Hardware Company have succeeded J. H. Parks in the Shelf and Heavy Hardware, Stove and Tinware business in Lorimer, Iowa.

H. L. Hahnenkratt and L. C. Ames, formerly of Phillipsburg, Kan., have entered the Hardware business in Washington, Kan., under the style of Hahnenkratt & Ames. Besides Hardware, they will deal in Stoves, Tinware, Sporting Goods, Wind Mills, &c.

The Wilson Hardware Company have succeeded Wilson-Beemer Hardware Company, Washington, Iowa, wholesalers and retailers of Shelf and Heavy Hardware, Stoves, Tinware, Furnaces, &c.

The Ingram-Richardson Company, Beaver Falls, Pa., have just booked an order for 100 dozen Enameled Iron Washboards, to be sent to the Philippine Islands.

The Lalance & Grosjean Mfg. Company of New York City are distributing a neat little pamphlet, printed in two colors and tastefully illustrated, on the subject of the company's Agate Nickel Steel Ware. The special recommendations of this ware are set forth in an entertaining manner, and a number of illustrations of various utensils are presented, together with a view of the company's large factory at Woodhaven, L. I.

We have received from the S. M. Howes Company, 40-46 Union street, Boston, Mass., a package of circulars relating to the line of Refrigerators made by the Gurney Refrigerator Company of Fond Du Lac, Wis., for which concern they are the New England agents. These include the Gurney, La Belle and Cold Wave Refrigerators. A special leaflet illustrates and describes the single door Gurney Refrigerator, which is one of the latest constructions of the company. This Refrigerator is furnished with the Gurney patent sliding, adjustable shelf, also a removable galvanized ice compartment, and all of the other special features found in the Gurney Refrigerators. These Refrigerators are made in a new factory by new and improved machinery of the best available materials.

Phillips, Yarbrough & Allen have bought out the retail Hardware and Stove business of L. F. Dickson, at Opelika, Ala. The new firm propose to greatly extend the business and will be glad to receive catalogues and price-lists from manufacturers in their line.

C. W. Lord & Sons have succeeded the firm of Lord & Cope in the Hardware, Stove and House Furnishing business at Dover, Del.

A new departure has been taken in trade methods by the Lalance & Grosjean Mfg. Company of New York, who have established in two of the large department stores of the city—one in Manhattan and one in Brooklyn—a representative who conducts a demonstration of the company's Agate Enameled Ware. The demonstrator explains to the public the special merits of this class of Enameled Ware, and informs them of the manner in which the utensils are manufactured, so as to bring out the superiority of the goods in a most convincing manner. Naturally those who hear the lecture are impressed with the excellence of the Lalance & Grosjean Enameled Ware. As a result they proceed to provide themselves with a battery of Agate Kitchen Utensils, and furthermore become missionaries in spreading the reputation of the Ware among their friends and neighbors.

E. Buskett & Co. have opened a new store at Attica, Kan., and are making a specialty of Hardware, Stoves, Tinware and House Furnishing Goods.

The Osborn Mfg. Company, makers of the Osborn Metal Bird Cages, have removed from their old factory, at 79 Bleecker street, New York, which they have occupied for 32 years, to more commodious quarters at 669-685 Hudson street, corner of Fourteenth street. In the new quarters the company will be provided with twice the amount of floor space and much better showroom facilities than they previously possessed. They propose bringing out several new styles of Cages.

William H. Dolan has opened a retail Hardware, Stove and Tinware store at Fishkill Landing, N. Y.

The Nickel Plate Stove Polish Company, Chicago, are distributing illustrated circulars calling attention to their Peerless Iron Enamel, an air drying Enamel of a brilliant jet black color, which, it is claimed, will never wear off. This Enamel is put up in self sealing cans with brushes and screw top cans without brushes, and is especially adapted for family and general use.

The Triumph Adjustable Stove Pipe Mfg. Company, Joliet, Ill., have issued illustrated circulars describing their specialties. They manufacture under their own patents the Triumph Adjustable Stove Pipe, which is so simple that a boy can put it up or take it down. The Pipe requires no wiring to hold it in place, but after the joints are put together they are practically one length of pipe, and will not sag or come apart, but will stand perfectly true with ceiling and wall. The Pipe is made in the usual length and nested for shipment. The nesting is also an advantage to the user, as the Pipe can be taken down in the spring, cleaned and nested so as to take up very little room. The company also manufacture the Barclay Knockdown Stove Pipe, which is not adjustable but has the advantage of nesting for shipment. The Barclay Pipe has the same joints as the Triumph Pipe but differs from the latter in the manner in which it is locked. One of the circulars gives a number of testimonials from those who have handled the company's Pipe.

B. L. Spofford has lately opened a store at Waltham, Mass., carrying Hardware, Tinware, &c.

Roberts & Connell have been succeeded by Roberts & Vernon in the Hardware, Stove, Farm Implement and Sporting Goods business in Lewiston, Mo.

Brownell Bros. have purchased the Hardware business of the E. E. Stewart Company, Hailey, Idaho, wholesale and retail Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c. The new proprietors will soon incorporate as Brownell Bros. Company, with a paid in capital stock of $25,000.

The Farmers' Hardware Company, Saratoga Springs, N. Y., are just starting in business as dealers in General Hardware, Farming Implements, Stoves, Tinware, Paints, Glass, &c., and would be glad to receive catalogues and price-lists.

Geo. H. Taylor, dealer in Shelf Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, and also Plumbing, Heating, &c., Wakefield, Mass., desires catalogues and other printed matter relating to these lines.

J. C. Wright, dealer in Hardware, Stoves, Sporting Goods, Agricultural Implements, Harness, &c., Ashland, Neb., has been succeeded by Wright & Stone. The firm have doubled the stock formerly carried.

The Manitowoc Aluminum Novelty Company of Manitowoc, Wis., have opened an English salesroom at 7 New Union street, London. They are represented in New York City by S. B. Thorp, 290 Broadway.

HEATING ENGINEERS' SUMMER MEETING.

Under date of April 12 Secretary Mackay has issued a call for the fifth semiannual meeting of the American Society of Heating and Ventilating Engineers, to be held at Atlantic City, N. J., on Monday, June 16. The place for holding the meeting and the hotel accommodations will be announced later. An invitation is given to the members to prepare papers and to send them in as early in May as possible, so that they can be distributed to the members before the meeting. The members are also invited to present any topics that they desire to have discussed.

President A. E. Kenrick announces the appointment of the following Committee on the Grate Area of Boilers Relative to the Radiation in Buildings: A. S. Hamlin, 84 Beekman street, New York; J. A. Gorton and James Mackay. This committee were appointed in accordance with the request made at the annual meeting in January. The committee would be glad to hear the views of all interested in the subject.

Announcement is also made of the appointment of the following Committee on Uniform Contract and Specification: S. A. Jellett, 245 North Broad street, Philadelphia; W. H. McKeever, H. J. Barren, R. P. Bolton and F. A. Williams of New York. This committee is considering a form of uniform contract intended to comply with the laws of all States and to cover all special points in every line, such as rights of lien, questions on trespassing on adjoining property, injuries to men, &c., and they solicit the views on these subjects of members in different sections of the country, asking that they be placed in their hands previous to May 15.

The members of the special committee for making the tenth annual meeting of the society a special anniversary meeting are invited to consider the subject and to be prepared to discuss it at a meeting of the committee, to be held at Atlantic City during the summer meeting in June.

Acetylene Lighting a Field for Plumbers.

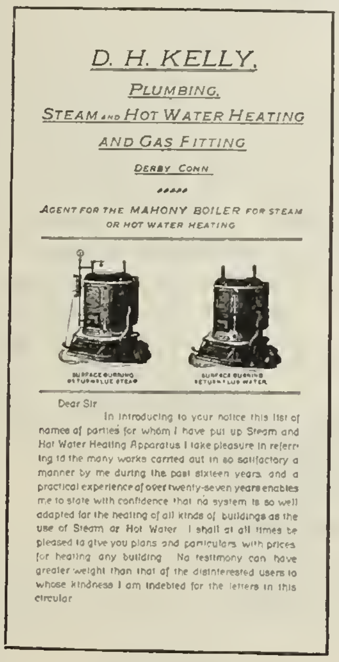
Acetylene is not ranked as a new subject now, says the *Plumber and Decorator* of London, England, yet it is so new that hundreds of plumbers who might be pushing it, and making money by carrying out the work, have not yet taken hold of the sale of the generators. Small blame to them if they have good reasons; but it is desired to say right here that acetylene is a living, practical means of lighting, and plant and piping for this means if illumination can be fitted up without difficulty and in a manner that will give perfect satisfaction. Failures there have been, and doubtless there are some to come, but this is no reason whatever for hesitating to become proficient. Acetylene has got such a foothold, thanks to some pushing, earnest men, that practically every plumber, sooner or later, must take it up. So why not now? It is very simple, but not simple enough to start without a knowledge of the subject, yet it is not beyond any one's learning.

It is quite within the range of possibilities that every country residence of fair size, the owner of which can afford a moderate priced lighting plant, will be lighted by acetylene. There are a good many perfect installations being put in now, and they create just as great an enthusiasm as the failures created distrust, or worse. One user of acetylene, an able man at the head of a great college, says he would not now have coal gas (let alone lamps) even if a gas company's mains were brought past his buildings. There is no doubt about acetylene being a more satisfactory and pleasing gas than that derived from coal.

Acetylene costs considerably less than coal gas in country places. Theoretically the former gives a light equal to coal gas at 60 cents per 1000, the figure being arrived at in this way: Coal gas gives a 16-candle power light burning 5 feet per hour; in other words, 3200 candles for one hour. Calcium carbide costs 4½ cents per pound, and this quantity has a lighting value of 240 candles for one hour. Therefore, to obtain 3200 candles for one hour, 13 1-3 pounds of carbide must be purchased, costing 60 cents. This, as stated, is the theoretical cost and, as usual, the practical and actual figures are different. There is factor's profit on the carbide, carriage of same, interest on the outlay incurred in fitting up the plant, &c.

A HEATING CONTRACTOR'S CIRCULAR.

Commendable enterprise is shown by D. H. Kelly, Derby, Conn., in the circular which he has prepared for distribution with the purpose of increasing his business as a heating contractor. The accompanying illustrations show the four pages of this folder, much reduced in size, the real size of the pages being 5¾ x 11½ inches.



D. H. KELLY,

PLUMBING,

STEAM AND HOT WATER HEATING

AND GAS FITTING

DERBY CONN

AGENT FOR THE MAHONY BOILER FOR STEAM OR HOT WATER HEATING

SURFACE BURNING RETURN FLUE STEAM
SURFACE BURNING RETURN FLUE WATER

Dear Sir

In introducing to your notice this list of names of parties for whom I have put up Steam and Hot Water Heating Apparatus I take pleasure in referring to the many works carried out in so satisfactory a manner by me during the past sixteen years, and a practical experience of over twenty-seven years enables me to state with confidence that no system is so well adapted for the heating of all kinds of buildings as the use of Steam or Hot Water. I shall at all times be pleased to give you plans and particulars with prices for heating any building. No testimony can have greater weight than that of the disinterested users to whose kindness I am indebted for the letters in this circular.

SHELTON, CT

Fourth Page.

A Heating Contractor's Circular.

On the first page of the circular Mr. Kelly refers to the many plants he has installed with satisfactory results during the past 16 years, and calls attention to the fact that he has had 27 years of practical experience in the business. On pages 2 and 3, under the heading of "What the People Say," are given letters from prominent residents and business men of Derby, Ansonia and neighboring towns, which testify to the satisfactory way in which systems installed by Mr. Kelly have worked. The last page bears a list of residences, stores, factories, public buildings, &c., in which steam or hot water plants have been installed by him.

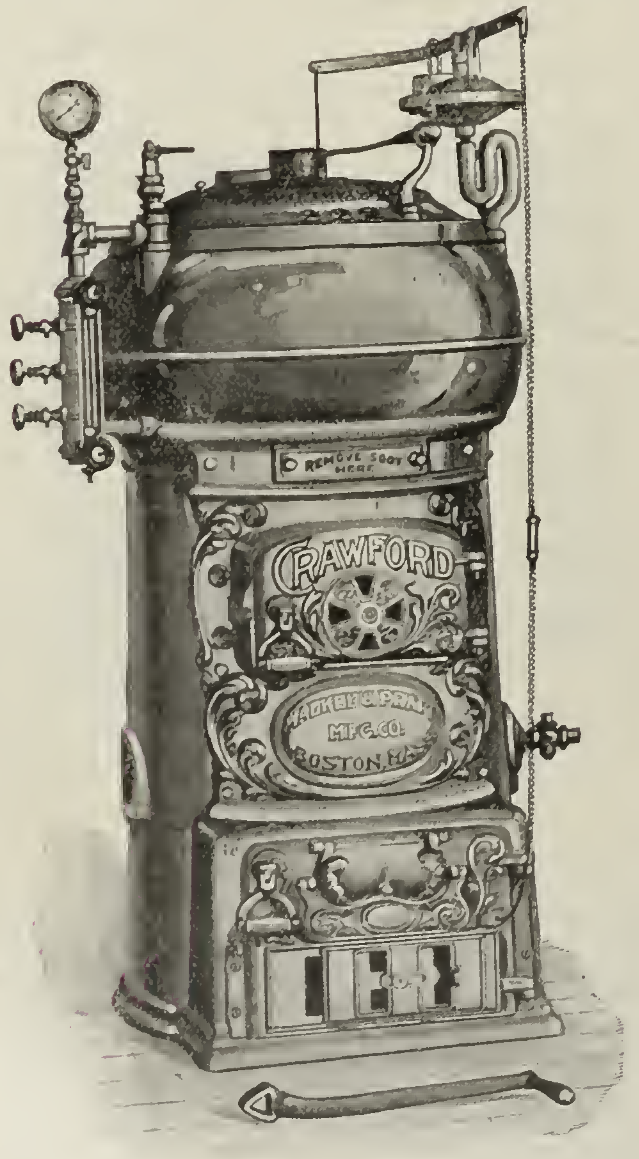
Mr. Kelly says that whenever he hears of a new building being erected and is unable to call on the builder personally, he sends one of these circulars with his letter, requesting that he be permitted to bid on the heating plant. When he does this he generally adds in ink two or three names at the bottom of the last page, giving the plants he has most recently put in. He has found that this circular impresses prospective customers very much, showing to them that he has put in a great many of the best plants in the locality.

A Steam Test.

Naked steam pipes are still quite common, to say nothing of boilers exposed to constant drafts wholly unprotected as to their shells. The loss of fuel by this neglect is very large, increasing with the size of the superficial areas, and very few steam users are aware of the expense entailed by uselessly heating the atmosphere. George H. Barrus lately tested the steam system at the Manhattan Railway power house in this city with the following results: A 2-inch steam pipe 100 feet long, under 80 pounds pressure, lost by condensation in pounds of water per hour when covered only 15.14 pounds, while uncovered the condensation was as a maximum 60.30 pounds of water; under 100 pounds of steam per square inch the greatest condensation was for the same pipe 72.20 pounds. A 10-inch pipe 35 feet long under 100 pounds pressure, naked, lost, maximum, 112 pounds of water per hour by condensation; when covered this was reduced to 15.93 pounds as a maximum. The temperature of the room where the experiment took place was 50 to 75 degrees F. Comment seems unnecessary.

The Crawford Boiler.

One of the latest constructions of interest to the steam and hot water trade is the new Crawford boiler that is being put on the market by the Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass. A general view of the boiler with steam trimmings is presented in Fig. 1. The boiler is of circular form and of the horizontal sectional type. The fire chamber section, by means of corrugations, presents a large surface and the upper horizontal sections, over which the products of combustion play, are also provided with an increased surface by means of corrugations, as shown in Fig. 2. The upper sections are arranged with staggered openings, so as to secure an indirect draft and at the same time effect both economy in fuel consumption and a high efficiency in heating. The boilers are made in five sizes, having 20, 22, 25, 28 and 32 inch grates, and are rated to carry from 475 to 1300 square feet of direct hot water radiation, and from 300 to 850 square feet of direct steam radiation. The boilers are well adapted for use in low cellars, the largest size, with steam trimmings, standing but 61 inches in hight. It is pointed out that the construction enables the boiler to be readily set up by the steam fitter, while the different parts are of a size that enables it to be readily taken into a building through the usual doors and windows. The company are distributing an eight-page catalogue giving a number of half-tone engravings showing different parts and giving full explanation and tables of dimensions.



The Crawford Boiler.—Fig. 1.—General View of Steam Boiler.

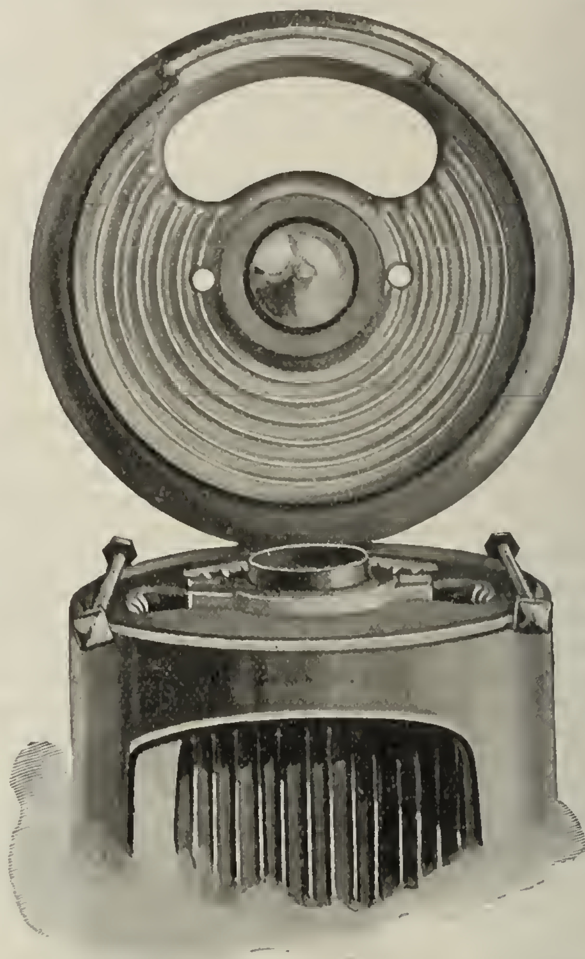


Fig. 2.—Interior View.

Radiator Tests.

Experiments just completed at Sibley College, Cornell University, by H. F. Moore and E. Schlemmer on " A Radiator Test with Superheated Steam " confirm previous results as reported by Professor Carpenter—viz., that the heat transmitted per degree difference of temperature between entering steam and the air of the room is decreased as superheating is increased. This general result is not particularly astonishing, but a record of the tests may be of some interest.

Summary of Tests.

	Number of trial.					
	1.	3.	5.	6.	7.	8.
Steam pressure, absol..	16.01	16.8	17.65	17.14	17.56	17.85
Degrees superheat.....	0.0	26.9	56.0	87.9	104.9	124.3
Heat radiated per hour per degree..........	41.55	34.74	30.0	24.5	24.22	21.7
Same per square foot surface	1.405	1.173	1.014	0.827	0.819	0.734

◆

Bids will be received until May 15 by S. P. Selfert, 326 Dale avenue, Roanoke, Va., for steam heating and plumbing the Elks' Home, at Roanoke.

CLEANING A HOUSE TANK.

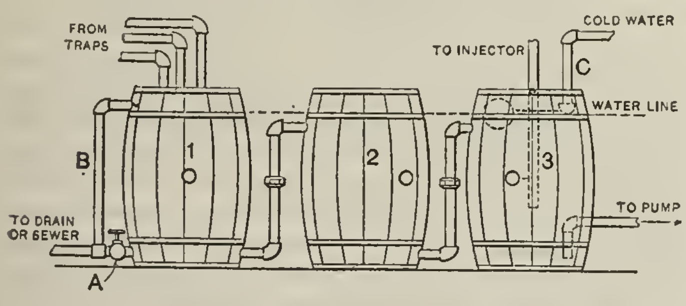
BY D. F. N.

A great deal of damage is often done to a good plumbing system through ignorance or negligence on the part of the owners or engineers of buildings by not taking proper precautions when cleaning a house tank. When the water shows itself murky, instead of employing a plumber to see that the tank is cleaned in the proper manner the owner, particularly of a private dwelling, will often send some servant up to clean the tank. This is a kind of job that is distasteful and it is hurried through with as soon as possible. The water supply is shut off, then all the water is drawn off from the tank at some one of the different fixtures in the bathroom below. When the sediment or mud, which has settled at the bottom of the tank, is reached, a servant takes pains to sweep or force down the falling supply line as much of the mud as he can, being ignorant of the result of such work. The disadvantage of this course will show itself as soon as the tank is filled again. All of the cold supply lines to bathrooms and under floors will be found to be more or less choked with mud, and also the water back in the kitchen ranges. An instance has come under my observation where the tank had not been cleaned for a long time and slimy mud had formed above the outlet and stopped it up. It was cleaned carelessly, as described, and many of the cold water supply pipes were filled with mud, making several days' work for the plumber to clear them. The proper way to clean a tank is to empty it to within about 6 inches from the bottom and close all of the pipe openings with round, tapered soft wood plugs. The solid matter should then be removed and the tank scrubbed and the dirty water taken up in pails and poured into the gutter. The solid mud can be disposed of in the ash cans. This method prevents the pipes from being choked and insures the tank being clean.

Apparatus for Removing Oil from Exhaust Steam.

A simple, home made device for removing oil from the condensation of exhaust steam is described as follows by a writer in *Steam Engineering:*

This apparatus is to be used where the returns come through steam pipes. Get three whisky barrels and connect them by 1¼ or 1½ inch pipes, as shown in the sketch. The drips from the traps flow into barrel No. 1. The barrels are open at the top, as no pressure is carried in any of them. When all the barrels fill to the water line indicated, the oil and scum will be taken off by the overflow pipe B; if enough water does not come from the drips to keep the barrels filled to the water level, the deficiency is supplied from the cold water pipe C. By opening the valve A barrel No. 1 can be drained out, and also any oil and scum that has worked through into barrel No. 2 will run out through the pipe connection into No. 1. The cold water feed will then wash out barrel No. 1. Of course valves may be put in the bottoms of barrels Nos. 2 and 3 to drain them completely, but I do not consider it necessary.

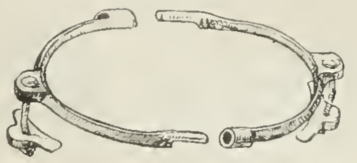


Apparatus for Removing Oil from Exhaust Steam.

THE contract for heating and plumbing the Haskell Memorial Library has been awarded to the Rock Island Hardware Company of Derbyline, Vt., and Rock Island, P. Q.

The Granton Adjustable Hopper Clamp

In the accompanying illustrations we show the Granton adjustable hopper clamp, put on the market by Clifton A. Granton, 5 West street, Haverhill, Mass., for which he has taken out a patent. A general view of the clamp is shown in Fig. 1. It consists of two castings arranged to encircle the earthen or cast iron short hopper bowl, and is provided with a lug and a socket to make, when connected, one continuous rigid clamp, to insure greater strength and evenness of pressure when the bolts securing it to the trap are tightened. Fig. 2 shows the clamp connecting a hopper bowl with a trap. It is claimed that where this clamp is used it is not necessary to use legs on the water closet seat. It is also pointed out that the plumber saves considerable time and some labor by its use, as compared with the common clamp. Mr. Granton issues a circular giving full particulars in reference to the clamp and its construction.



The Granton Adjustable Hopper Clamp.—Fig. 1.—General View.

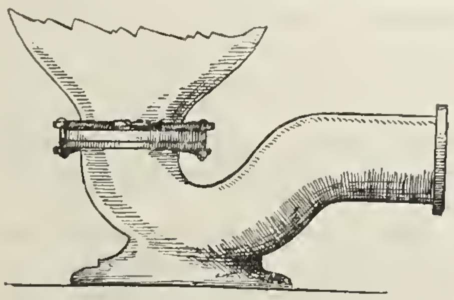


Fig. 2.—Showing Clamp in Use.

Electric Heating.

Electric heating makes way but slowly, says the *Western Electrician.* It is good, but expensive. It is very convenient—almost indispensable, in fact—on large electric cars; but what a demand it does make on the power house! In the power plant of the Northwestern Elevated Railroad it is shown that in severe weather from 20 to 50 per cent. of all the current sent out on the line is used in heating the cars. So if electric heating and cooking could be generally introduced it would be a fine thing for the central stations, but rather hard on the householders. However, special appliances for utilizing electric heat continue to be brought out. Thus, a German company announce an apparatus for the heating of goods exposed in show windows for the prevention of the settling of steam or ice on the window panes. The device consists of an iron frame, in which a number of wires are fixed in such a manner as to prevent a short circuit. The heating resistance is so calculated as to exclude superheating, even by maximum load. The contrivance has the advantage that it is not necessary to disturb the goods when turning the heat on or off, as this may, of course, be done by means of a switch fixed anywhere in the shop. It is also less dangerous than the open gas burners sometimes used for this purpose. In special applications such as this and in use with certain kinds of tools electric heating seems to find its greatest utility outside of the warming of passenger cars.

THE annual convention of the National Association of Master Plumbers of Australasia opened in Adelaide, South Australia, on April 1. Delegates were expected to be present from Victoria, New South Wales and other provinces of the Australian Federation. Among the special features of the convention were to be the reading of several important essays and the discussion of the report of the Sanitary Committee.

ASSOCIATION NEWS.

Paterson Master Plumbers.

After being for some time without a Master Plumbers' Association, the plumbers of Paterson, N. J., are again to have an association. On April 9 the master plumbers met at the shop of Robert Quinn, 9 Fair street, and perfected their association, deciding to call the organization the Master Plumbers' and Heating Engineers' Mutual Protective Association of Paterson. The following officers were elected for the ensuing year:

President, James H. White.
Vice-President, E. A. Marcey.
Secretary, Robert Quinn.
Financial Secretary, George S. O'Neil.
Treasurer, Andrew J. Fielding.

The association already has 25 names on its roll, and others who were unable to attend the meeting will join at the next meeting. The following Conference Committee was appointed: James T. MacNab, James Davenport, Jr., Robert Quinn and Isaac Storms.

Master Plumbers' Association of Pennsylvania.

The annual convention of the Master Plumbers' Association of Pennsylvania was held in Altoona on April 15. The reports of the officers showed the association to be in a flourishing condition. After the transaction of the routine business of the association the following officers were elected:

President, Gregor Drummond of Philadelphia.
First Vice-President, E. J. Cake, Reading.
Second Vice-President, S. S. White, Pittsburgh.
Third Vice-President, O. L. McCartney, Altoona.
Secretary, Howard Smith, Philadelphia,
Treasurer, John H. Birchall, Allentown.

Pittsburgh was selected as the place for holding the next convention.

The regular monthly meeting of the Master Plumbers' Association of Northwestern Pennsylvania was held at Cambridge Springs on April 10.

The convention of the Connecticut State Association of Master Plumbers is to take place in Masonic Hall at Bridgeport, Conn., on Wednesday, May 14, and the annual banquet will be held in the Atlantic Hotel, Bridgeport.

Charles J. Boyd, president of the Illinois Master Plumbers' Association, is making an extended business trip through the State in the interest of the association.

New York City Notes.

The wage question is agitating the minds of many connected with the building trades at present, a general advance having been demanded, and in some cases granted. Bricklayers have signed an agreement with their employers for a year from July 1 at an advance of 5 cents an hour. The plasterers' laborers are demanding $3.50 a day in Manhattan. Tile layers and marble men also want an advance. The Brooklyn plumbers have been on a strike since the 15th inst., demanding $4 a day at once, and saying if that is not given $4.25 will be the next demand. The Manhattan journeymen plumbers are asking $4.50 a day from May 15.

⁂

There is a considerable amount of big work in the market, some of which has been contracted for already; but whether it will stand for these advances is a problem, as there are many men in all lines out of work at present.

⁂

A few Brooklyn master plumbers, with time limits and without strike clauses in their contracts, have given in, and are paying the increased rate of wages demanded, but the majority are holding out as yet.

⁂

Mayor Low has finally made the long expected changes in the Examining Board of Plumbers, appointing William Montgomery of Manhattan in place of John Renehan, and Edward Macdonald of Brooklyn in place of Edward Haley, as representing the master plumbers, and David Jones of the Bronx in place of James E. McGovern, as representing the journeymen. The new board is thoroughly representative, and all members are good organization men.

⁂

John Byrns is plumbing the new residence of George Gould, at Lakewood, N. J. Mr. Byrns, who has been confined to his house for some weeks with inflammatory rheumatism, is now attending to business again.

⁂

A. W. Reynolds of 2110 Broadway has the plumbing contract for a nine-story apartment house, at 24 West Forty-fifth street. Charles Stuart of 1027 Lexington avenue will soon begin work on the new West End Theater, at 125th street and Columbus avenue.

⁂

J. L. Fruin of Chicago is in the city. He was a welcome guest at the last meeting of Manhattan Branch.

⁂

At a meeting of Manhattan Branch on Tuesday the following were elected delegates to the meeting of the National Association, at Atlantic City, June 17-19: Andrew H. Brown, B. F. Donohoe, Philip Brady, T. A. Hill, A. W. Reynolds, T. J. McCormack, Wm. Kirchhof, Thomas J. Tuomey, M. J. O'Brien, Edward J. Brady, Alex. Bryant, Thomas J. Cummins, Gen. Geo. D. Scott, John Byrns, John Mitchell, Samuel L. Malcolm, Thomas F. Gaynor, James Gillroy, J. A. Rossman, Henry G. Gabay, Isaac J. Brown, John Renehan, P. J. Andrews, Edward J. Riordan, Patrick Brady, Adam Huston, E. J. Renehan, Henry J. Pattison, I. O. Shumway, Thomas Martin, James Smith, F. S. Cochrane, Jr., Frank Reynolds, Louis H. Strob, Joseph W. O'Brien, Philip Smith, William J. McDermott, James O'Brien, A. E. Jackson, Joseph T. Coyle, Thomas F. McCaul, Charles Tucker, Samuel Klein, John W. Cooney, James F. Kelly, John Toumey, Matthew F. Donohue and Charles A. Walsh.

INFECTED WATER.

How Microbes Are Conveyed Into the Human System.

While typhoid fever is chiefly a water-borne disease, says a special contributor to *Fire and Water*, the microbe which causes it to be developed in the system need not necessarily be conveyed into the stomach and bowels through the medium of water or any other liquid. After a flood or freshet, the deposit left upon the banks of a river in which the typhoid germ is present dries up, or is frozen, and turns to fine, almost impalpable dust. This is absorbed into the system through the nose and mouth. Thus dust particles aided by the wind are vehicles for spreading the disease. City houses that are closed in the summer, when reopened in the autumn, abound in accumulations of dust which, on examination, are found to be full of pathogenic germs, all of which have been blown in through the windows and other points of entrance from the streets, and are such as are found in the dejecta of horses and other animals. These microbes are very hard to kill, and multiply with amazing rapidity when they have once found a nest in which to breed.

A case in point is afforded by an outbreak of typhoid fever which took place some years ago in Athens. The nucleus of the germs was found to be a group of laborers who were engaged in excavating the soil in a street through which a sewer had once been turned up and exposed. These men probably carried the germs away with them in their clothing and on their persons, while at the same time the wind caused the typhoid dust particles thus disturbed by the excavation to be carried to certain parts of the city.

In Heligoland, also, where the hygienic conditions should be almost perfect, as the island is exposed to every wind that blows up and down and across the German ocean, there have of late years been many cases of typhoid fever, the cause of which for a long time puzzled the local doctors. Its origin, however, was finally traced to a certain house, in which there had been a case of typhoid fever. The sickness had been hidden from the doctors, so that the cottage had never been disinfected. It was also learned that, in accordance with the primitive customs of the island, where there is no sewerage properly so called, the dejecta of the patient had been thrown over and upon the cliffs—the method usually followed by the Heligolanders in disposing of their sewage. The unwholesome matter thus left to dry in the sun became desiccated and pulverized. It was scattered broadcast over one district in the form of typhoidal dust, and, in addition to being absorbed into the system by means of the nose and throat, was taken direct into the stomach and bowels, owing to the germs being conveyed to the open-air cisterns in which the rainwater is stored for domestic use—the source of supply for most of the inhabitants. That this was no mere theory was shown from the fact that the quarter of the island where the epidemic was most severe, to which, indeed, it was virtually confined, coincided with the direction of the wind prevailing at the time.

With such facts to guide us, therefore, there can be very little doubt that the cases of typhoid fever which have recently occurred in New York, especially in Manhattan and the Bronx, have been due, first, to the unclean condition of the streets, and, secondly, to the many excavations which are visible on all sides in the city, whether for the building of the rapid transit tunnel and new sewers, the erection of huge skyscrapers, or the laying of conduits, new mains and gas pipes. For these more or less sporadic cases the Croton water has been blamed. This charge, however, cannot rightly lie against that supply, or, if any cases can be traced to it, we shall find on examination that the water so furnished may not be drawn direct from the mains but from some roof-tank, which was either unclean through neglect, or into which, however tightly it may have seemed to have been closed, some pathogenic germs had been carried by dust particles from the streets. One of these days, possibly, these roof-tanks (in themselves often a source of danger to the fire department when a roof fire takes place) will be done away with. Till that time comes, however, the Board of Health should insist not only upon their being properly protected from disease microbes by the nearest possible approach to dustproof covers, but also that they shall be frequently inspected, their contents emptied out, and the tanks themselves thoroughly disinfected and sterilized. The risk to health arising from the use of the water contained in them would thus be minimized.

Heating and Plumbing Notes.

Under date of April 1 E. D. Hornbrook, president of the National Association of Master Plumbers, has issued from the association headquarters in Kansas City, Mo., a new edition of the "Directory of Recognized Master Plumbers," consisting of 169 pages, showing an increase in membership. The book is accompanied by a request that State vice-presidents and secretaries of local associations examine the list and make corrections in the spelling of names and the addition of new members.

Captain Emery was more than successful with the Plumbing and Steam Supply League bowling team in their contest with the Bank Clerks' League on April 11, winning two out of three games and putting up the highest score yet made in any game, the total being 952 pins, to which Ex-Secretary Wilson contributed 211 and Secretary McCormick 213. The team took part in another contest last night, and it is hoped that they made an equally good showing.

Foskett & Bishop, New Haven, Conn., have the contract for plumbing the new factory of the Fair Haven Food Company.

The following officers were elected at the recent annual convention of the Master Plumbers' Association of New Zealand: President, J. R. Christie; vice-president, J. Scott; treasurer, H. A. Ross; secretary, H. B. Renfree, all of Dunedin. Vice-presidents were also elected for the different provinces: T. Ballinger, for Wellington; J. Colville. for Canterbury; R. G. Spiers, for Southland; W. Heinz, for Westland, and A. Burt, Jr., for Otago.

Charles H. Mays, president of the Maddock Pottery Company, Trenton, N. J., has been elected president of the recently incorporated Trenton Heat & Power Company.

James Donovan, Middletown, Conn., bid $2597 and secured the contract for plumbing the dining hall building of the Connecticut Hospital for the Insane.

The Gas Appliance Company of Baltimore, Md., recently incorporated, will continue the business formerly conducted by the Gas Appliance Exchange, at 14 North Charles street, that city.

Libby & Blinn of Hartford, Conn., are placing a No. 2 Mercer Hot Water Boiler of eight sections for heating 12 hothouses for the Connecticut Tobacco Company, at Granby, Conn. They have recently completed the installation of a hot water heating system in six tobacco hothouses at Fequonnock, and hot water heating systems in the sweat rooms of C. S. Griswold & Co. of West Hartford, and in the tobacco starting house of M. Farnham, at Windsor.

The N. O. Nelson Mfg. Company, St. Louis, Mo., are now at work completing a new catalogue of their extensive line of plumbing goods, which will soon be ready for distribution.

A. G. Ivers. for a number of years with the New York house of Peck Brothers & Co., has engaged with Cornell & Underhill, New York, and will have charge of the plumbing department of their business.

The Speakman Supply & Pipe Company of Wilmington, Del., are distributing Catalogue B, which is devoted to fine thread Brass Pipe Fittings.

Malbin & Kammerman, 922 Third avenue, New York, are arranging to devote their energy entirely to the manufacture of an extensive line of Plumbing Supplies and have discontinued their branch at 193 Broome street.

E. G. Bates, Springfield, Mass., has the contract for plumbing a new hotel in Lee.

In Edinburgh, Scotland, recently, the court dismissed a claim against a plumber for £100 damages sought by a woman for injuries sustained by her child, through her pinafore catching fire at the plumbers' fire used by the defendant's workman.

A fire visited the plumbing establishment of John Burns, 1414 Franklin street, Brooklyn, N. Y., on April 10, causing damage amounting to $700.

John Sicard, a master plumber of Maisoneuve, dropped dead in the City Hall at Montreal, Canada, on April 8.

The new Tube mill of the Wheeling Steel & Iron Company, Wheeling, W. Va., is expected to be ready to make Pipe by June.

The Mayor of Reading, Pa., has appointed John E. Deiner plumbing inspector of that city.

O. H. Stinson, senior member of the plumbing firm of Stinson & Kennedy, 218 Wood street, Pittsburgh, Pa., died on April 6 from injuries sustained in collision with a trolley car. He was 43 years of age. Mr. Stinson was a vestryman of Grace Church and a member of the Royal Arcanum. He is survived by a wife and two daughters.

A new warehouse is soon to be built by the Crane Company of Chicago, at Sioux City, Iowa, at the rear of their building, at 816 Fourth street. It will be one story in hight and about 150 feet in length and will be used chiefly for the storage of Pipe and similar heavy stock.

Frank G. Du Bois, in addition to being a Fellow of the American Association of Public Accountants and holding a certificate from the University of the State of New York as a certified public accountant, has also been an active worker in military affairs. He has served for several years in the Seventh Regiment of the National Guard at New York City, acting as sergeant in the hospital corps. Mr. Du Bois has his headquarters at 100 Broadway, New York, and is prepared to give service to his many friends in the heating and plumbing supply trade, with which he has a personal knowledge from his former connection with it.

The School Board of Colorado Springs, Col., has awarded the contract for plumbing and heating the Sheldon School to H. W. Davis & Co., at their bid of $3795, and that for plumbing the Midland School to J. M. Dillon at $1200. The heating of the Midland School was awarded to St. John & Barnes at their bid of $4690.

The stockholders of the Burley Heater Company, Tyrone, Pa., on Monday, April 8, elected the following Board of Directors: G. Harvey Burley, Allen S. Garman, A. J. Hahn, Joshua Burley, Charles R. Reese, Robert A. Wilson and Diller Buck.

The *Plumber and Decorator* of London quotes figures from the census of 1901 which show that there are 10,766 plumbers, plumbers' helpers and apprentices in the city of London. Among this number are six plumbers who claim the United States as their native country. An increase of 1444 plumbers is shown since the previous census in 1891.

Louisiana & Arkansas Railroad, through their purchasing agent, J. A. Buchanan, Stamps, Ark., desire copies of catalogues and price-lists relating to Plumbing Goods.

The Barnes Mfg. Company, Mansfield, Ohio, have prepared a paper covered pocket edition of Pump Catalogue C, which is an exact duplicate of their large Catalogue C, and which is issued for the convenience of their Pump customers who may desire to carry such a catalogue in the pocket. It will be cheerfully sent to any dealer on application.

Jay H. Newbury, Goshen, N. Y., manufacturer of Iron Pipe Fittings, Gray Iron Castings, &c., is building an addition to his foundry, 26 x 120 feet.

The Robert Campbell Heating Company have moved to their new quarters, at 106 and 108 Beekman street, New York, where they have full possession of a four-story building. They will make a specialty of the Hot Air Furnaces made by the Utica Heater Company of Utica, N. Y., and will show their line of Steam and Hot Water Boilers.

Mayor Edward E. Willard of Chelsea, Mass., will receive bids until April 24 for heating and ventilating the new High School Building, and bids will be received for the plumbing until April 21.

The president of the Superior Board of Health of San Juan, Porto Rico, has issued a circular stating that after July 1 Soil Pipe known in the trade as "standard" will not be permitted in plumbing work, the board having decided to adopt a thicker and heavier Pipe after that date.. The board also prohibits the use of Iron Flush Tanks and provides that Wooden Tanks lined with copper shall be used instead.

The Decatur Plumbing & Heating Company, Decatur, Ill., bid $4965 and secured the contract for plumbing and gas fitting the James Millikin University Building in that city.

The strike in the plumbing trade at St. Paul, Minn., has been adjusted, an advance in wages of 50 cents having been agreed upon to offset the higher cost of living.

The Board of Education of Hamilton, Ohio, will receive bids until May 9 for the plumbing and installation of a flush closet system in the new school building in the first ward.

James M. Kline, Beavertown, Snyder County, Pa., is sending to the trade a four-page circular devoted to the Kline Hydraulic Ram. This Ram is made in five sizes, having delivery pipes from ⅜ to 1¼ inches in diameter. The valves are said to be capable of easy regulation, and the Rams have the capacity to raise water 25 feet for every foot of fall in the drive pipe.

F. C. Prior of Monterey, Mexico, who makes a specialty of plumbing work and the erection of Wind Mills, Pumps, &c., is reported to be at present figuring on three big contracts in that city.

The authorities of the city of Philadelphia have decided to enforce the law against the plumbers who make a practice of connecting water service with buildings from the street mains without taking out a permit, the city having lost considerable revenue through plumbers failing to make a record of their work. The penalty is $50.

The movement for a consolidation of the principal potteries of Trenton, N. J., and East Liverpool, Ohio, which has been under way for some little time past, is reported to have fallen through because of the withdrawal of some important Trenton interests. The failure of the scheme is said to have caused considerable disappointment to some of the pottery owners, as it had been thought certain to go through.

The Buckingham-Routh Company, New Haven, Conn., have contracts for furnishing many new residences with heating apparatus. The Ideal Boilers and American Radiators are to be installed in most of these instances.

Coates & Son, Findlay, Ohio, bid $6000 and were awarded the contract for heating and plumbing the new Adams Building in that city.

Owing to the strike among the plumbers at Springfield, Ohio, the master plumbers have decided to keep their shops open in the future to any journeymen capable of doing work.

Bids will be received until April 23 by the Board of Awards of the city of Baltimore, Md., for heating and ventilating a new school building at Chestnut and Fourth streets.

The committee of New York jobbers and manufacturers of Plumbers' Supplies who were appointed to oppose the passage through the State Legislature of the Wilson bill have reported that the bill passed the Assembly with the obnoxious amendment, and that it was sent to the Senate and there died. It was learned that the Smith bill was never reported out of the committee, and died by the adjournment of the Legislature. Senator Brackett also introduced a bill on the same subject, which was amended in the Senate, and referred back to the committee, where it will peacefully rest. Thus the present Lien law relating to conditional sales remains in force the same as heretofore.

New Firms and Changes.

The Keystone Valve & Mfg. Company have been organized at Pittsburgh with a capital of $10,000. The concern will make a specialty of the manufacture of a new steam valve patented by Harry Keyes of Homestead, Pa.

W. P. Benstein and Fred. Johnson, who have been for a number of years with the Sullivan Plumbing Company, have opened a plumbing and heating business on Washington street, between Fourth and Fifth avenues, Bay City, Mich.

David A. Westbury succeeds to the plumbing and heating business of H. P. Blair & Co., on North Main street, South Bend, Ind., through the withdrawal of H. P. Blair from the firm.

The Deady Brass Company have been incorporated at Houston, Texas, with a capital of $10,000, by J. S. Deady, H. W. Cortes and J. C. Bering.

James C. Farrell has opened a plumbing establishment in the Reynolds Building, at White Plains, N. Y.

Luke M. Harrington has purchased the plumbing business of the late Michael Dore, at Waterford, N. Y.

The recently incorporated Sharp Mfg. Company, Albert Lea, Minn., have taken over the plant of J G. Sharp, which they will enlarge by the erection of a new foundry, 24 x 50 feet. The company will manufacture Wind Mills, Tanks, Oilers, Gasoline Engines and will do general foundry work.

The Rockford Heating & Fuel Saving Company have been incorporated by Frank Olander, Charles Olander and A. W. Banks, at Rockford, Ill., with a capital stock of $2500, for the purpose of manufacturing Heating and Illuminating Devices.

The Salem Brass & Iron Mfg. Company, with principal office at Salem, N. J., have been incorporated with a capital stock of $100,000 to manufacture Brass, Iron, Steel, &c. Harry G. Hart, Edward Stratton and J. W. Van Meter are the incorporators.

It is reported that a syndicate is arranging to pipe natural gas from Clarksburg, W. Va., to the Pittsburgh district, through a 12-inch main.

The St. Louis World's Fair.

From all accounts, the preparations for the Louisiana Purchase Exposition are making excellent progress. The extensive grounds to be occupied by the exposition are being laid out and work on the various buildings has already begun, and in some cases carried well forward. The management of the exposition is exerting every effort to make the enterprise one of the largest and most attractive expositions yet held. The outlook for a large and representative showing of American products and manufactures is said to be very favorable. The rules and regulations have been published, and are now being distributed by the management, together with a book containing the official classification of exhibit departments. An abstract of this classification covering the various departments and groups and classes of exhibits, which will be more particularly interesting to our readers was presented in *The Metal Worker* of March 1.

The regulations provide for a very liberal amount of space for exhibits in the various buildings, and the management is urging upon American manufacturers the desirability of making early application for accommodation. Applications for space for exhibits in the line of machinery and mechanical appliances intended for exhibition in operation must be filed before October 1 for machinery and mechanical appliances not intended to be shown in operation by November 1, and for other natural or manufactured products by December 1, 1902. No charge will be made for space allotted to exhibits. Exhibitors of manufactured articles must be the manufacturers or producers of the same. All applications for space must be in writing, and addressed to the president of the Louisiana Purchase Exposition Company, St. Louis, Mo., and should be presented on forms, which will be furnished by the exposition company on application.

Freight and express charges, and all other expenses appertaining to the transportation of exhibits, must be prepaid at the point of shipment, and the goods delivered at the exposition clear of all charges. No exhibits will be allowed to be removed until the close of the exposition. All showcases, cabinets, shelving, counters, &c., required in the installation of exhibits must be provided at the expense of the exhibitor, and all pulleys, belts, belting, countershafting, &c., as well as all water, sewerage and compressed air connections must be paid for by the person applying for the same. Exhibitors desiring to contract for service of electricity, steam or compressed air, power from shafting, gas or water, must make application for the same to the chief of the department in which their exhibits are installed.

An official catalogue of all exhibits will be published in English by the exposition company. The system of awards will be competitive. The merit of exhibits, as determined by the jury of awards, will be manifested by the issue of diplomas, which will be divided into four classes: A grand prize, a gold medal, a silver medal and a bronze medal. Special rules and regulations governing the system of making awards will be promulgated hereafter.

◆

We are indebted to George H. Barbour of the Michigan Stove Company for a copy of the report of the Pan-American Exposition Commission for the State of Michigan, of which commission Mr. Barbour was the president. The report which is bound in red leather covers and gotten up in excellent style, presents portraits of the officers and members of the commission, and gives a complete account of the Michigan exhibits at the Pan-American Exposition, together with an excellent halftone engraving of the Michigan State Building and views of a number of the exhibits from that State.

Joseph Richards, inventor of Richards' Aluminum Solder, and a well known authority on aluminum, died on March 22 at his residence in Philadelphia, aged 62 years. Mr. Richards was born in England, and came to the United States 30 years ago as superintendent of the Delaware Metal Refinery of Philadelphia, which position he held up to the time of his death. For his aluminum solder he was awarded the John Scott medal of the Franklin Institute, and was also the recipient of a second medal from the institute for his testing machine for determining the grade of lead and tin solders. He also introduced a number of aluminum zinc alloys, which have been adopted for commercial use. His son, Dr. Joseph W. Richards, author of a work on aluminum, is assistant professor of metallurgy at Lehigh University.

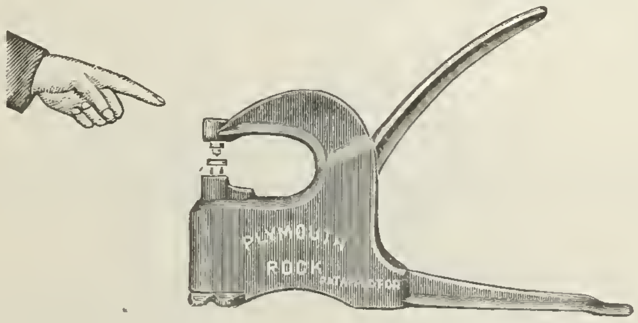
Plymouth Rock Hand Riveting Machine.

The Root Brothers Company, Plymouth, Ohio, have recently brought out an improved hand riveting machine, known as their Plymouth Rock, for setting tubular and slotted rivets. It is illustrated herewith. The advantage claimed for this riveting machine is that it automatically adapts itself to all lengths of tubular and slotted rivets, thus saving time and all lost motion. This result is brought about by means of an automatic telescoping device, in which the rivet is placed and held until ready to be used. In order to rivet it is only necessary to insert the object to be riveted between the telescoping device and the die or anvil and press down the lever. The die or anvil which upsets the rivet is case hardened, and every part, it is stated, is made for durability. The riveter is finished in baked japan and bronzed.



Plymouth Rock Hand Riveting Machine.

Lighting Churches.

While a great many methods of lighting a church or other large auditorium are now in vogue, some of them very good attempts at successful lighting, a system that never seems to fail, and which has scored over 20,000 successful installations in churches alone in all parts of the world, is that of the famous Frink reflector, familiarly known as "The Great Church Light," a title gained by nearly half a century of work in this line. Among more recent installations made by the manufacturer, I. P. Frink, 551 Pearl street, New York, might be mentioned Grace Evangelical Church, at Scranton, Pa.; Zion Lutheran, at Loudonville, Ohio; St. Luke's Lutheran, at York, Pa.; Baptist, at Picture Rocks, Pa.; Belmont Avenue Baptist, at Springfield, Mass.; Bruns Avenue Methodist Episcopal, at Detroit, Mich.; First Christian and German Presbyterian, at Shelbyville, Ind.; Dayspring Presbyterian, at Yonkers, N. Y.; Plymouth Congregational, at Des Moines, Ia., and Grove Avenue Methodist Episcopal, at Johnstown, Pa. The lighting of a church auditorium successfully is a by no means simple problem, and mistakes occur where least expected. A consultation with this firm beforehand insures a successfully lighted church at a minimum expense, and they will be glad to forward literature, catalogues and all necessary information on receipt of required data as to size, &c.

◆

Secretary A. C. Faust of the Stuart & Peterson Company of Burlington, N. J., who is also secretary of the Burlington branch of the New Jersey Anti-Convict Labor Association, has written a strong letter to Senator Fairbanks of Indiana, commenting upon his speech in support of the Chinese Exclusion bill, in which Mr. Faust compares the arguments brought forward for the exclusion of Chinese in the interests of American labor with what he regards as still more cogent reasons for the abolition of convict labor in the production of goods for the American market.

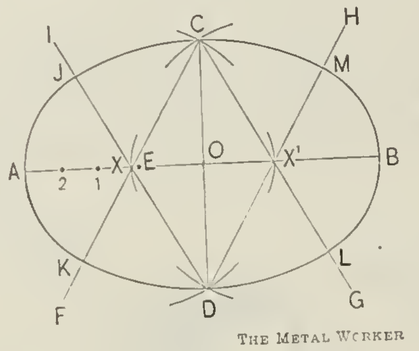
Pattern for Oval Pudding Pan.

Without Allowance for Laps.

In making oval pudding pans of IX or IC tin, care must be taken to obtain a true pattern, so that when the pattern is formed up to the required shape it will be true to its profile and have a level line on top and bottom. However, before a pattern can be obtained we must first know how to construct the elliptical figure, so that a set of centers can be obtained with which to strike the arcs desired.

THE CONSTRUCTION OF AN ELLIPSE.

In Fig. 1 is shown the method of drawing an approximate ellipse to given dimensions. Let A B represent the length of the pudding pan, and C D its width. Take the distance of C D and place it from B on B A, as shown by the dot E. Now divide the distance E to A into three equal parts, as shown by 1 and 2. Take two of these parts as radius, or E 2, and with O as center describe arcs intersecting the line B A at X and X¹. Then with X X¹ as radius and using X and X¹ as centers describe arcs intersecting each other at C and D. Draw lines from C to X and C to X′, extending them toward F and G, respectively. In similar manner, from D draw lines to X and X′, extending them toward I and H, respectively. Now with X and X¹ as centers and X A or X¹ B as radii describe arcs intersecting the lines I D, F C and G C, H D at J, K and L, M, respectively. In similar manner, with D and C as centers and D C and C D as radii describe arcs which must meet the previous arcs at J M and L K, respectively, forming an approximate ellipse.



Pattern for Oval Pudding Pan.—Fig. 1.—Method of Drawing an Approximate Ellipse.

PATTERN FOR PAN.

In Fig. 2 let A B C D represent the side elevation of the pan, whose vertical hight is equal to R C. In precisely the same manner as described in Fig. 1 draw the plan, as shown, in correct relation to the elevation, letting E F G H be the plan of the top of the pan, and J K L I the plan of the bottom, struck from the centers O, M, P and N.

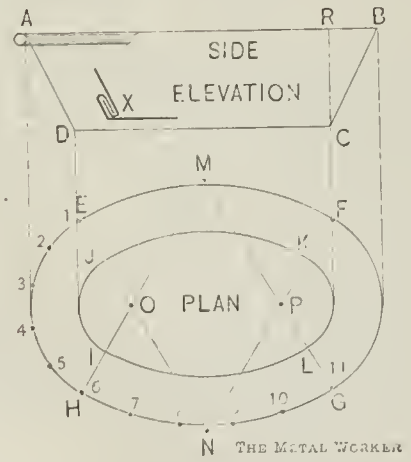


Fig. 2.—Plan and Elevation of Pudding Pan.

To obtain the radii with which to strike the pattern proceed as follows: Draw any horizontal line, R E in Fig. 3, equal to N E in plan in Fig. 2. Now take the vertical hight R C in elevation and place it, as shown by R C in Fig. 3, on a line drawn at right angles to E R. Parallel to R E and from the point C draw the line C J, equal to N J in plan in Fig. 2. Now draw a line from E to J in Fig. 3, extending it until it meets the line R O at O. Then will O J and O E be the radii with which to strike the pattern for that part of the pan shown in plan in Fig. 2 by E F K J and G H I L.

Now take the distance from P to F in plan, and place it, as shown from R to F in Fig. 3, on the line R E. In similar manner take the distance from P to K in plan in Fig. 2 and place it in Fig. 3 on the line C J, as shown from C to K. Draw a line from F to K, extending it until it meets the center line R O at P. Then will P K and P F be the radii with which to strike the pattern for that part of the plan shown in plan in Fig. 2 by K F G L and I H E J.

Next divide the curve from E H in plan into equal spaces, as shown by the small figures 1 to 6; also divide the curve H to G in equal spaces, as shown from 6 to 11. For the pattern proceed as follows: In Fig. 4 draw any vertical line, as E O, and with radii equal to O J and O E in Fig. 3, and using O in Fig. 4 as center, describe the arcs J K and E F, as shown. Now set the dividers equal to the spaces in H G in plan in Fig. 2, and starting from E in Fig. 4, step off the required number of spaces, as shown from 11 to 6.

From 6 draw a line to O intersecting the curve J K at K. Now with P F in Fig. 3 as radius and F in Fig. 4 as center describe an arc intersecting the line F O at P. Then using P as center and with radii equal to P K and P F describe the arcs K L and F G, respectively, as shown. On the arc F G, starting from F or point 6, lay off the stretchout of H E in plan in Fig. 2, as shown by points 6 to 1 on the curve F G in Fig. 4. From 1 draw a line to P intersecting the arc K L at L. Then will E F G L K J be the half pattern. If the pan is to be made in one piece duplicate this half pattern opposite the line E J.

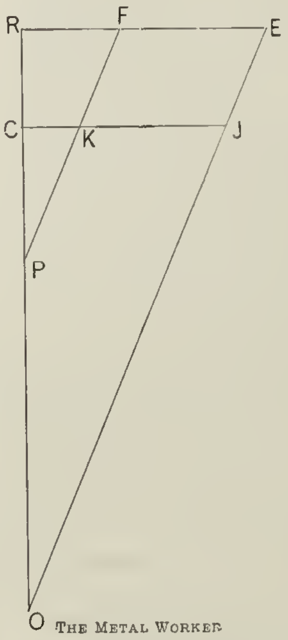

Fig. 3.—Obtaining Diagram of Triangles.

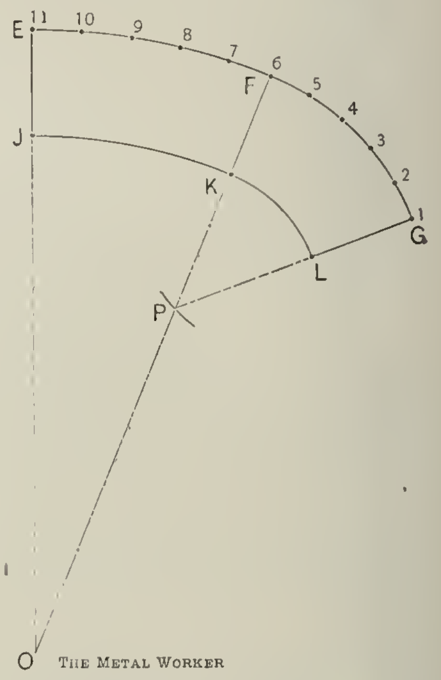

Fig. 4.—One-half Pattern Shape.

Should the pan be desired in four sections then two pieces of the patterns E F K J and F K L G would be required. Allowance should be made for seaming and wiring. The bottom of the pan is shown by J K L I in plan in Fig. 2, which is double seamed to the body similar to X in the elevation.

The Monarch Iron & Steel Company, recently incorporated under the laws of the State of Delaware with a capital stock of $100,000, will build a plant adjoining that of the Parkersburg Iron & Steel Company, at Parkersburg, W. Va., for the production of Planished Iron Sheets, under the patents of G. C. Broomall of Parkersburg. The plant is expected to be in partial operation by May 1. The officers of the company are: S. N. Nease, president; E. M. Whitto, secretary; G. C. Broomall, treasurer, and J. R. Rose, general manager.

NEW COAL TAR PRODUCTS ASSOCIATION.

The constant consolidation of manufacturing and distributing interests is again supplemented by the addition of another important industry to the already long list of such concentrations. We refer to the recent combination of the manufacturers of coal tar products under the name of the Coal Tar Products Association of the United States of America. This organization includes nearly all the manufacturers of this line of goods in the United States, and Jenkins & Hardy, 100 William street, New York, are the official representatives of the manufacturers, who have joined forces to regulate and advance the prices of this line of goods. These advances represent an average increase of approximately 20 per cent. on tarred felts and roofing materials of this character.

The prices which have been decided upon vary from a minimum figure ruling in metropolitan territory—that is, the City of New York and territory immediately adjacent thereto—to higher figures for the goods delivered in the Southern States, as follows:

	Metropolitan territory. Carloads.	Southern territory. Carloads.
Tarred Felt, per ton	$29,00	$35.00
" " 2-ply light, per roll.	.50	.65
" " 3-ply light, per roll.	.77	.85
" " 2-ply heavy, per roll	.60	.75
" " 3-ply heavy, per roll	.87	.95
Slaters' Felt, per ton	34.00	40.00

The following prices are for less than carloads or mixed carloads, and on goods the association are not competent to make absolute prices on, as they do not control the product—viz.:

	Metropolitan territory. Per ton.	Southern territory. Per ton.
Rosin Sized Sheathings	$30.00	$38.00
Deadening Felt	35.00	45.00

The prices as given above do not include one extreme Southern point, Tampa, Fla., which are fixed on a basis of $38 per ton on tarred felt as against $35 as above, the other items being advanced in proportion.

Boston prices average about 5 per cent. higher than New York prices, except on deadening felt, which is $3 per ton less than New York prices.

The territory embraced by the range of prices given covers what is known as the New England, Middle and Southern Atlantic States, which strip has been comprehensively divided into 18 divisions in great detail. The cities of Boston, Providence, New York and Philadelphia, which are in a sense manufacturing points, take minimum prices, while the territory most distant from these points take higher delivered prices, the difference being mainly the cost of the freight. The prices for less than carloads average from 10 to 20 per cent. higher than carload prices quoted above, depending on the cost of delivery.

The weights of 2 and 3 ply and slaters' felt have been increased about 5 pounds per roll over the old weights for low priced goods.

No prices are made on straight carloads of tar, rosin sized sheathings and carpet linings.

Another provision is that no contracts shall be made and all prices are subject to change without notice.

A concession of 5 per cent. will be made to purchasers of either 150 tons of pitch or 100 tons of felt within a stipulated time.

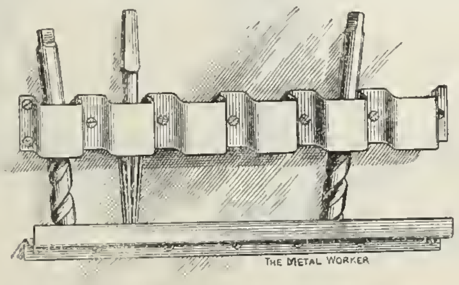
This association is simply an agreement, among the manufacturers of this class of merchandise, to control and regulate prices, and is not a consolidation of various units into one company.

The Amalgamated Association Convention.

The Amalgamated Association of Iron, Steel and Tin Workers met for their twenty-seventh annual convention on Tuesday, April 15, in Wheeling, W. Va., with some 250 delegates. The principal subject for consideration at this convention will be the wage scale. Notwithstanding the existence of considerable opposition to President Shaffer and some of the present officials of the association, it is believed that the arrangement entered into by them with the American Tin Plate Company, the American Sheet Steel Company and the Republic Iron & Steel Company, in regard to the continuance of the present scale, will be indorsed by the convention. It is understood that a strong effort will be made to prevent the re-election to the presidency of Theodore J. Shaffer. The only name that has been given out so far as favored for the presidency in opposition to him is that of Assistant Secretary Michael F. Tighe of Wheeling. The meetings of the association are held behind closed doors, and but little reliable information in regard to the proceedings is likely to be available until the close of the meeting.

A Tool Rack.

A very simple tool rack is shown in the accompanying illustration. While in use in a large number of shops, there are many other shops which might adopt this rack to their advantage, for it is much better to have a place in which every tool belongs than to have no particular place for any tool. This rack consists of a strip of tin, bent, as shown, to receive the different tools. To prevent the tool from slipping out a little shelf, also made of tin, is nailed under the rack at the proper distance, as illustrated. The rack, as shown, is in use in the store of O. D. Sykes, Seymour, Conn., who has been a constant subscriber to *The Metal Worker* for many years.



Tool Rack.

A Southwestern Supply House.

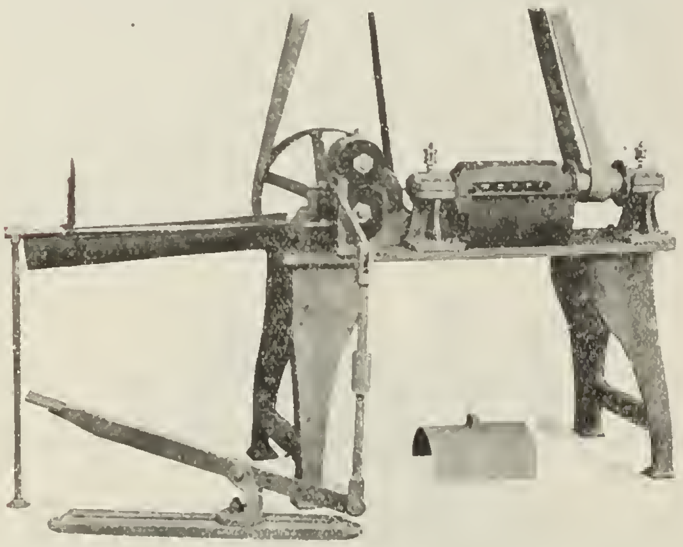
The Peden Iron & Steel Company, Houston, Texas, are sending to the trade a handsomely bound catalogue of 414 pages, showing the great variety of goods which they carry in stock and are prepared to ship promptly. A useful feature of the work is an index occupying 12 pages. The catalogue is divided into four departments, the first including sheet iron, sheet zinc and sheet copper, metal roofing and siding, steel ceiling, tank steel, solder, tin plate, tinners' tools and supplies, including cornice brakes, squaring shears, tinners' trimmings, finials, crestings, ventilators, roofing tiles, conductors, eave trough, strainers and rain water cut offs. Another section is occupied by a varied line of heating and cooking stoves, kitchen hollow ware, stove pipe, elbows, chimney caps, dampers, stove polish and stove boards.

Department B is devoted to mechanics' tools, including ratchet and post drills, brushes of all kinds, emery wheels, twist drills, saw sets, punches, plyers, hammers, axes and an extensive variety of wood working tools, rules, tape measurers, die stocks for threading bolts, and iron pipe, together with pipe wrenches, pipe tongs and pipe cutters, vises and pipe cutting and threading machinery. In Department C are presented cast and wrought iron pipe and fittings, lead pipe and lead lined pipe, the cast iron fittings being made for both steam and water and for drainage systems. These are followed by a complete line of brass valves and iron body brass mounted valves for steam apparatus and for drive wells. Oil cups, safety valves, grease cups, injectors, lubricators, steam gauges, fusible plugs and speed indicators are also shown, followed by a complete line of pumps and pump supplies, shafting, pulleys, hangers and belting. Hose and hose supplies with nozzles and quick repair apparatus complete this department.

Department D opens with wire and wire nails for all purposes and woven wire for poultry netting and of all sizes of mesh for different uses. Wiremen's supplies, insulators, wire rope, tackle blocks and chain blocks are another group of supplies. Bar iron and rolled iron, tool steel, machine and carriage bolts, lag screws and bolts for various purposes are followed by nuts and washers and wood screws. Grindstones, heavy chain, blacksmiths' blowers and forges, horse shoes and nails are followed by hinges, barn door hangers, shovels, wheelbarrows, lanterns and a complete line of cement, roofing supplies and paints, with roofing and sheathing papers, deadening felt and asbestos.

Wire Straightener and Cutter.

Herewith is given an illustration of the patent wire straightener and former manufactured by L. H. Solosth & Sons Stamping Works, Grand Rapids, Mich. The machine is made very strong and is so arranged that the wire can be cut any length. The wire is straightened in passing through the machine and leaves the cutter perfectly straight. The dies are double acting and are made so absolutely uniform that exact duplicates can be furnished when desired at any time.



Wire Straightener and Cutter.

Of Interest to Roofers.

Follansbee Brothers' Company, Pittsburgh, Pa., with branches in Philadelphia, Chicago and Louisville, have issued a 48-page catalogue covering the line of goods which they manufacture or handle. The first place in the publication is given to the firm's special brands of roofing plates, of which they manufacture 13 varieties, and their bright charcoal tin plates. A table is given of the net weight per box of the tin plates. These are followed by galvanized sheets, black sheets, blue annealed steel sheets, planished iron, polished steel and American blue steel sheets, accompanied by tables of weights and measures, also painted or galvanized corrugated sheets, solder and a long line of roofers' supplies, including self capping, roll roofing, pressed standing seam roofing, V crimped roofing, imitation weather boarding, pressed brick siding, beaded ceiling, ridge cap, eaves trough, miters, conductor pipe, elbows and shoes, rain water cut offs, eave trough hangers, conductor strainers, conductor pipe hooks, &c. Tinners' rivets, stove pipe elbows, copper wire, galvanized hoop iron, registers and ventilators, dampers and damper clips, soldering coppers and tinners' tools and machine form another section of the catalogue, which closes with a list of sheet copper, copper bottoms, pits and flats, sheet zinc, boiler handles, roofing cement, rosin and nails. The publication contains a number of useful tables of weights, sizes, gauges, &c., as well as a table of calculations for tin roofing. An interior view of the company's tin plate factory is presented at the end of the catalogue, together with an index.

Manager Lewis Lea of the Sandusky Plumbing & Boiler Company, Sandusky, Ohio, closed a contract with Lewis P. Brown of Kelly Island, to do the hot water heating and plumbing in his new home.

FLASHINGS.

The strike of 3000 employees at the New York and Brooklyn factories of the American Can Company was declared off on Monday and the strikers returned to work the following day. The dispute was settled by the company abolishing the system of time slips, which was objected to by the workers.

F. S. Wheeler, secretary and treasurer of the American Can Company, has also been appointed auditor of the company.

W. S. Bullard, Bridgeport, Conn., is roofing a large building for Colonel Warren, one for the Bridgeport Brass Company and one for the Union Typewriter Company in Bridgeport. He has recently completed the roofing of several buildings for the Union Metallic Cartridge Company.

It is said that the American Tin Plate Company are contemplating purchasing the abandoned mill property of the Hussey Steel Company, at New Kensington, Pa., with a view to adding it to the property already owned by the company at that place. It is understood that the Pennsylvania and Pittsburgh plants of the American Tin Plate Company, at New Kensington will be enlarged in the near future by the addition of several mills.

The corrugating department of the Parkersburg Iron & Steel Company's plant, at Parkersburg, W. Va., has been put in operation.

H. J. Pratt & Co., Springfield, Mass., have the contract for a galvanized iron front in connection with the alterations being made in the Brewer Building, in that city. They are also placing metal ceilings in several buildings.

The Duluth Corrugating & Roofing Company, Duluth, Minn., have just put in metal walls and ceilings for J. L. Travers of that city, which are referred to as the most artistic interior decorations of their kind in the city.

The Huntington Tin & Planished Plate Company of Huntington, W. Va., recently incorporated with an authorized capital of $200,000, $50,000 of which is paid in, will erect immediately a two-mill plant, which they expect to increase to a ten-mill plant in the near future. The necessary buildings have been contracted for, and most of the machinery has also been ordered. The president of the concern is B. W. Foster; treasurer, W. H. H. Holswade; secretary, J. W. Valentine; manager, John A. Jenkins, and purchasing agent, D. A. Mossman.

Work is progressing rapidly on the new buildings which the Ashland Sheet Mill Company are putting up at Ashland, Ky. The main building will be 420 feet long and 100 feet wide, and will contain sheet and bar mills and the necessary furnaces, as well as an electric crane. The boiler house and electric plant are being constructed at a spot north of the main building, near the river. The equipment will consist of ten steel boilers 20 feet long and 72 inches in diameter, together with a complete electric plant of more than sufficient capacity for the initial needs of the mills. Twenty-eight arc and 200 incandescent lights will be installed at the start. Two Porter-Allen engines will furnish the power, as well as a separate bar mill engine.

St. John & Barquist are erecting a two-story brick building, 44 x 100 feet, at Des Moines, Iowa, which they will equip with machinery for the manufacture of Cornices, Steel Ceilings and Stamped Metal Work.

Roofers and tinsmiths, who have occasion to edge quantities of Tin Plate, are invited by the Danzer Metal Works, Hagerstown, Md., to carefully investigate Danzer's Lightning Edger. This machine works very accurately by foot or hand power, saving time and labor. The manufacturers claim it to be a valuable acquisition to any shop.

The Double Truss Cornice Brake Company, 1453 Niagara street, Buffalo, N. Y., manufacturers of Double Truss Cornice Brakes, Beaders, &c., have incorporated under same name, with a capital stock of $75,000, and intend either to enlarge their present plant or erect a new one in the near future. The officers are Hugh Falconer, president; F. H. Silk, secretary and treasurer, and John H. Crocker, general manager.

E. W. Bliss of the E. W. Bliss Company, Brooklyn, N. Y., has gone to Europe for a two months' pleasure tour.

S. H. Isler, Jr., who conducts a roofing, plumbing and heating business at Kinston, N. C., is desirous of receiving catalogues and price-lists from manufacturers of Steel Ceilings.

THE NORTH END UNION PLUMBING SCHOOL.

The graduating exercises of the ninth term of the North End Union Plumbing School of Boston, Mass., were held at the school on Wednesday evening, April 16, the Rev. Paul Revere Frothingham presiding. Previous to the opening of the exercises an opportunity was given to the visitors to inspect the work of the past season's plumbing class, which reflected great credit upon the school.

The chairman in opening said, among other things, that education should be broad and inclusive of everything which pertains to the welfare of life; that the trained eye and hand is as important and amounts to as much as what is called mental training. The work done in the school of plumbing was just as truly educational as that done by the students at Harvard.

Daniel Shannon, president of the Master Plumbers' Association of Boston, in following, said that his organization had always taken a lively interest in the school, its presiding officers having participated in all of the graduating exercises of the institution since it began. He emphasized the fact that the school, at best, can only lay the foundation, which, though all important, is only a preliminary to the greater demands of the trade. Success in the plumbing trade, as in any other, depends upon the individual. Mr. Shannon said he made this statement out of his own experience, from the time when he entered the trade at $6 per week until he received $47 per week. In closing, he urged the boys to make good use of their spare time in study and in the acquisition of general information. Character, he remarked, lay at the foundation of all true success.

Robert D. Andrews of the firm of Andrews, Jaques & Rantoul, the well-known Boston architects, briefly traced the rise of education from the monasteries and the first universities down through the centuries, showing how the scholars went back to the literature of the Greeks and Romans. The study of these languages was regarded as desirable, and it was eventually made to appear essential to any education worthy of the name. This fetish is still worshiped in educational circles. Before manual training could get a foothold in the educational field it had to assert that there was no intention of teaching anything that would be of use to anybody, but that it was to be used only as any other disciplinary study. He characterized the present system of education as foolish, in so far as it does not provide that training which helps a man on the side of the material requirements of life. He sketched in brief outline the ideal school of the future, wherein the workshop would be co-ordinated with the academic work, and a training would thus be given which would not make a boy feel that he was forced into a new, unknown world on leaving school.

Albert A. Winship, editor of the *Massachusetts Journal of Education*, who was the next speaker, began his remarks by saying that traditions die hard, and that we have been wedded to the old ideas so long that it is hard to give them up. "A friend of mine," said he, "while in Scotland last summer visited one of the manual training schools. He saw a boy making a kite, and asked the boy if the kite would fly after it was made? The boy said, 'No, it will not.' 'Why do you make the kite if it will not fly?' 'Oh, this is a type kite!' 'But why do you not make one that will fly?' 'That would not be educational,' replied the boy. 'Can you make one that will fly?' 'Oh, yes sir; but we are not allowed!'" That in his opinion illustrated the attitude of mind toward our present educational system. We are coming, however, to recognize that the best education is worked out through that which is useful.

Before awarding the diplomas to the graduating pupils, David Craig, in alluding to the facetious remark of the presiding officer, that "all plumbers get rich," and to the observation of one of the other speakers, that it was "a sin for any man to die rich," said that Mr. Shannon himself had decided not to commit this sin. He told the boys that there never was a time in the history of the world when larger knowledge and better education were required for success in any one of the trades than at the present time, and he urged the pupils to employ every spare minute in acquiring that knowledge which was essential to success, closing his remarks with much excellent advice. Diplomas were then awared to the following eight graduates of the School of Plumbing:

Henry M. Cook, Brookline, Mass.
William A. Laraway, Cambridge, Mass.
K. W. McManus, Boston, Mass.
Joseph W. McNally, Andover, Mass.
Hans R. Neilsen, Boston, Mass.
Chris. Sorensen, Boston, Mass.
Eugene O'Neil, Boston, Mass.
Carl G. Pihlkrantz, Boston, Mass.

The North End Union School of Plumbing opened its first class in January, 1894, and, consequently, is now in its ninth year. The class during the past season has been full, and a number of applicants had to be turned away for lack of room. Superintendent Samuel F. Hubbard advises us that there has been a marked earnestness of purpose among the pupils, which is to be expected from young men who pay their own way. The tuition, in some cases, is but a small part of the expense, as there are several pupils who have to travel a round trip of 50 miles, and one more than 60 miles, to attend the class.

In the past season David Craig, one of Boston's leading master plumbers, gave lectures to the class on the technical science of plumbing. These lectures were delivered in a particularly clear and intelligent manner. Mr. Craig talked with a piece of chalk in his hand to illustrate by blackboard drawing the difficult points of his subject. William H. Haskell has had charge of the shop work as instructor, as he has in each previous season. Mr. Haskell's work is thorough and conscientious, based on the highest standards, and he never allows himself to say of a piece of work below this standard that "it will do."

The tenth term of the North End Union Plumbing School will open on Wednesday evening, October 1, 1902. Terms for the course are $10, payable in advance. No one under 17 years of age is admitted, and preference is given to those already engaged in the plumbing trade. Each applicant is required to declare his intention to remain in the school until he has finished the course. All tools and material are provided without cost. Those desiring to enter the school in the fall should send in their names at once. Blanks may be had by addressing Samuel F. Hubbard, superintendent North End Union Plumbing School, 20 Parmenter street, Boston, Mass.

A Reference Book on Transmission.

Reeves Pulley Company, Columbus, Ind., issue a small leather bound gilt edged pocket reference and memorandum book, size, 3 x 6 inches, covering much valuable information relating to variable speed transmission, illustrated with sectional and perspective drawings. The subjects covered are the use of variable feed transmitters on different mechanisms, relative working parts of the Reeves transmitter, rules for calculating size and speed of pulleys, &c.; tables of horse-power transmission, tables of speed varying mechanisms, special information for paper mill trade and considerable other information of value to all users of power. The demand for the little book has been so great as to cause the publishers to set the nominal price of 15 cents per copy, for which it will be sent postpaid to any address.

Addresses of manufacturers of and dealers in fuel oil burners are wanted by Marvine Gorham, care of Michigan Bolt & Nut Works, Detroit, Mich.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

IMPROVEMENTS IN BOILER CONNECTIONS.

From S. L. R., Newark, N. J.—I thank you for the ideas in reference to hot water boiler connections presented in *The Metal Worker* of March 29, and hope that some of the readers of *The Metal Worker* will also express their opinions on this subject, for I still think that it is best to connect the pipes from the water back to the side of the boiler. Certainly when the boiler connection is in the side near the top it makes a neater job. Would not hot water flow from the water back when the faucet was open, instead of from the boiler, if the pipe were connected to the hot water service pipe at the top? If it was connected at the side would not the hot water flow from the boiler and give a better circulation between the boiler and the water back? Would it not also throw a more positive flow of hot water when a faucet was open, since there would be more hot water to draw from? Furthermore, it would not interfere with the circulation between the water back and the boiler while the faucet was open.

To make a still further comparison I present, in Fig. 1, the character of boiler connection which I recommend. Here a gas heater was used, or the water was heated from the fire in the range, which gives a quick heating connection and a supply of hot water to draw upon, while affording a better circulation, without any possibility of steam being trapped to interfere with circulation. In Fig. 2 is shown what I have found to be the best manner of connecting a gas water heater, so that the water heated will flow directly to the faucet, and a supply of hot water can be had without an expensive consumption of gas.

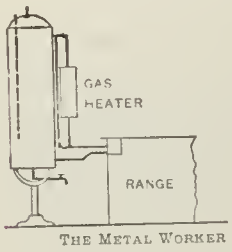


Fig. 1.—A Suggested Connection.

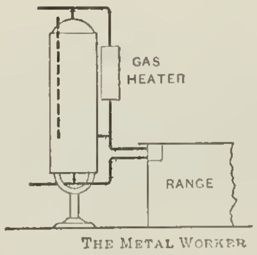

Fig. 2.—A Customary Connection.

Improvements in Boiler Connections.

Note.—Unless the fire is very low and going out, the hottest water that the apparatus is capable of furnishing will flow from the water back, the source of heat, and the water stored in the boiler will rarely be hotter. The connection shown in Fig. 2 certainly would affect the circulation when hot water was being drawn. There are advantages to be derived from the side connections and boilers would doubtless be made for them if there was sufficient demand.

WANTS A LACQUER FORMULA.

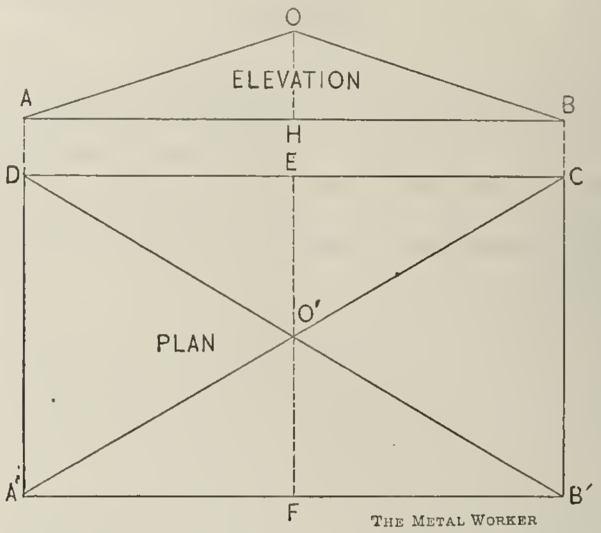
From W. C. W., North Lawrence, N. Y.—I should be glad if *The Metal Worker*, or some of its readers who have had experience, would inform me how lacquer is made and applied to stove pipe rings.

Note.—We shall be glad to present any information our readers may furnish for the benefit of this correspondent. In the meantime we would suggest that formulas for the making and application of lacquer are given in a number of receipt books, which can be furnished by our book department. Lacquers can be purchased cheaply from a number of manufacturing concerns, together with full instructions for their application either with a brush or by dipping.

PATTERN FOR SQUARE PITCHED COVER.

From E. G. Champion, Cortland, N. Y.—Will you kindly give me through the columns of *The Metal Worker* a pattern for striking out a square pitched cover?

Answer.—The making of a pattern for a square pitched cover is one of the most simple problems in pattern cutting. In practice the tinsmith generally cuts out the cover without the use of a pattern. Fig. 1 shows the plan and elevation of a square pitched cover, A B O being the elevation, and A′ B′ C D the plan. The line E O′ F divides the cover into two halves. In order to find the pattern for one of these halves it is necessary to find the true length of the lines represented in plan by E O′ and D O′. To do this draw a horizontal line, as H′ X in Fig. 2. At H′ erect a perpendicular, making O″ H′ equal to O H in the elevation in Fig. 1. From H′ on the line H′ X in Fig. 2 lay off H′ E′, making it equal to E O′ in Fig. 1. In Fig. 2 connect O″ and E′ with a straight line. Then the line O″ E′ represents the true length of line shown by E O′ in plan. In a like manner lay off H′ D′ in Fig. 2 equal to D O′ in Fig. 1, and connect the points O″ D′ with a line, O″ D′. Then this line gives the true length of the line shown in plan by D O′.



Pattern for Square Pitched Cover.—Fig. 1.—Plan and Elevation.

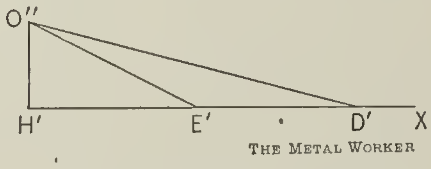


Fig. 2.—Diagram of Triangles.

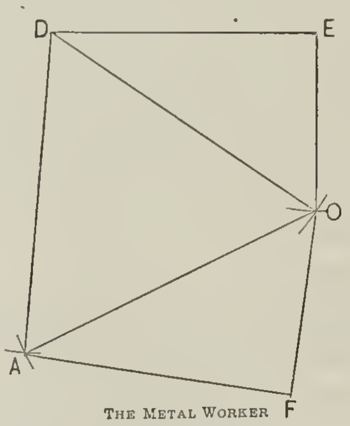

Fig. 3.—The Half Pattern Shape.

To make a pattern of a half cover draw the line D E in Fig. 3 equal to D E in Fig. 1. Then from E in Fig. 3 as a center and with a radius equal to O″ E′ in Fig. 1 strike an arc. Intersect this arc with an arc struck from

D in Fig. 3 as the center with a radius equal to O'' D' in Fig. 2. The point of intersection is shown at O. Draw the lines E O and D O. From D in Fig. 3 as the center and with a radius equal to D A' in Fig. 1 strike an arc, which interesect with an arc struck from O in Fig. 3 as the center with a radius equal to O'' D' in Fig. 2. The point of intersection is shown at A in Fig. 3. Draw the lines D A and O A. Again from O in Fig. 3 as the center and with a radius equal to O'' E' in Fig. 2 strike an arc, which intersect by an arc struck from A in Fig. 3 having a radius of A' F in Fig. 1. The point of intersection is shown at F in Fig. 3. Draw the lines O F and A F. Then E D A F will be the pattern for half the cover, the bends being made along the lines D O and A O.

THE LIFT OF A PUMP

From P. B., 497 Franklin avenue, Brooklyn, N. Y.—We would like to know from what depth water can be drawn by a pump.

Answer.—At the sea level the air pressure is about 14¾ pounds to the square inch, which is equivalent to a water column about 34 feet high. In other words, a pump piston creating a vacuum with no leakage will raise water about 34 feet. Our correspondent knows, however, that the imperfections in pump construction render it only practicable to pump water a shorter distance than this, and 25 feet is about the limit of a successful and easy operating pump. On the other hand, as we ascend the air pressure becomes less and less, as a barometer will indicate. For instance, at a distance from the sea level of ½ mile the pressure is only 13.3 pounds per square inch, and a pump, therefore, would only raise water at that hight 30.7 feet. At the hight of a mile the pressure is further reduced to 12 pounds per square inch, which would permit suction pumping from a depth of but 27.6 feet.

National Manufacturers' Association

The seventh annual convention of the National Association of Manufacturers opened at Indianapolis, Ind., on Tuesday, April 15, with a considerable attendance of delegates from all parts of the country. President Theodore C. Search of Philadelphia, in his annual report, called attention to the declining exports of American manufactured products and urged manufacturers not to neglect their foreign customers in this era of extraordinary home demand, lest in times of depression they should find their foreign trade destroyed and no outlet for the surplus of an overstocked home market. Among the subjects touched upon by Mr. Search were: Reciprocity with Cuba, the proposed new Federal Bureau of Commerce, the Nicaragua Canal, the consular service, the Eight-Hour bill and commercial education. Mr. Search announced that he would not be a candidate for re-election to the presidency, which he has filled with conspicuous ability for six years.

George H. Barbour of Detroit, Mich., chairman of the Committee on Rules and Order, made a report offering a few simple, practical rules for the guidance of delegates, which were adopted by the convention.

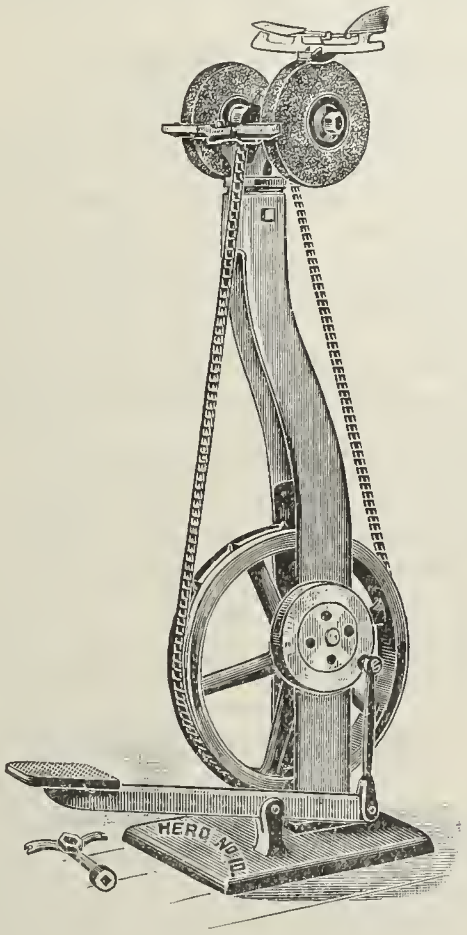
On motion of Mr. Barbour the president was instructed to telegraph to the Ways and Means Committee of the House of Representatives to ask them whether they would entertain a large committee from the National Manufacturers' Association in favor of the bill creating a department of commerce. Much interest was displayed in the bill providing for the compulsory use of the metric system, on which considerable division of opinion was developed.

Among the delegates to the convention were the following: P. A. Myers of F. E. Myers & Bro., Ashland, Ohio; Henry W. Avery of the Avery Stamping Company, Cleveland, Ohio; George H. Barbour of the Michigan Stove Company, Detroit, Mich.; James Powell of the William Powell Company, Cincinnati, Ohio; Thomas Devlin of the Thomas Devlin Company, Philadelphia; Oberlin Smith of the Ferracute Machine Company, Bridgeton, N. J.; George T. Coppins of the Walworth Mfg. Company, Boston, Mass., and James A. Coe of James Coe & Co., Newark, N. J.

On Thursday D. M. Parry of Indianapolis was elected president of the association, E. H. Sanborn of Philadelphia, secretary, and Hamilton Carhart of Detroit, treasurer. New Orleans was selected as the next convention city.

Hero Emery Grinder No. 10.

Robertson Mfg. Company, 38 Greenwood place, Buffalo, N. Y., manufacturers of patented hardware specialties, special machinery, tools, &c., have just brought out the No. 10 Hero emery grinder, here illustrated. It is referred to as a strong, practical machine with great speed and power. It has a special steel chain belt, running on toothed wheels, giving a positive drive with very little friction. The balance wheel is heavy, with a hardened steel shaft and a new anti-friction bearing. The column is curved, giving the operator a much better position in which to work than with a straight column, at the same time increasing the leverage on the treadle. The base, column and head are three distinct castings, so made that duplicate parts can be furnished if necessary. The ⅝-inch steel spindle runs in large bearings milled from the solid metal to an accurate fit and is geared 19 to 1 of the treadle. The head is adjustable in the column to take up any slack in the chain as it occurs from constant use. The hight of the machine is 40 inches and it is furnished with two emery wheels 6 x ¾ inches. With each machine is also supplied a special holder for grinding skates, knives, shears, &c., together with a wrench fitting all screws. This device is especially suited to the use of repair men, blacksmiths, plumbers and others having tools to grind.



Hero Emery Grinder No. 10.

United States Consul Worman writes from Munich, Germany, to the State Department at Washington that a Hamburg chemist is reported to have discovered a fluid which, when added to ordinary water, produces a liquid that cannot be distinguished from petroleum. It can be used for lighting as well as for heating purposes. When burned in a lamp with an ordinary wick, it gives an extraordinary white light of double the strength of a petroleum flame. The fluid is not explosive. A company, it is said, has been formed in London for the exploitation of this discovery.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is about 1c. higher, and firm but quiet.

Copper is quiet but somewhat firmer.

Pig Lead remains quiet and without change.

Spelter is firm but dull.

Antimony is unchanged.

Nickel is active at former price.

Aluminum is active and unchanged.

Tin Plates are quiet and prices firm.

Sheets continue in active demand, with heavy gauges scarce; prices are strong.

Foundry Iron is higher for spot and scarce.

Sheet Copper is in good demand and firm.

Sheet Zinc is without change.

Old Metals are not active, with prices rather weak.

Hardware is in large demand and prices are strong.

Builders' Hardware was advanced 20 per cent. in price.

Sad Irons have been advanced ¼c. per lb.

Plumbers' Supplies are in large demand, with prices firm.

Sanitary Earthen Ware prices are steadily maintained.

Wrought Iron Pipe is very stiff in price, and in good demand.

Roofing Felts have been advanced 20 per cent.

Wire Nails are firm, and in active demand.

Cut Nails are moving freely at former prices.

Window Glass was advanced 5 per cent. by jobbers.

White Lead is firm and unchanged.

Linseed Oil is quiet and firm.

Spirits Turpentine is ½c. higher and strong.

METAL MARKET.

New York, April 19, 1902.

Pig Tin.—Operations of a speculative character have continued in the London Pig Tin market. The manipulators have managed to hold the market up, as they did last week, and have sent prices still higher. Quotations at the close of the week ruled at about 1c. a lb. above those given in our last report, Straits Pig in small lots being quoted by jobbers at about 29½c. to 29¾c. per lb. The market was very inactive, however, as consumers are holding out just as long as they possibly can. Shipments from the Straits were very small during the first half of the month. The market closed strong with upward tendency, and a fair amount of business, which was confined to the supplying of current needs.

Copper.—Tuesday marked the inauguration of trading under the Standard Copper contract at the New York Metal Exchange. The trade showed an active interest in this movement and a comparatively lively business was transacted. The smaller consumers have been buying from hand to mouth, while the larger buyers are understood to have covered their wants for some time to come. It is said that the supply of Lake Ingot for immediate delivery is rather light, and this has tended to stiffen the market a trifle. Retail prices are without change. Lake Ingot in small lots being quoted at about 13¼c. to 13¾c. per lb., and Casting Copper 13c. to 13¼c. Exports have been very large, amounting to nearly 8000 tons in the first half of this month.

Sheet Copper.—A steady demand for Sheet Copper continues, with prospects of a considerable consumption of this material from now on. Prices are steady on the basis of 18c. per lb. for small lots from store.

Pig Lead.—This metal is dull and uninteresting, without any change in prices, which are very firm. Buying is on a very moderate scale. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report a fair demand and inquiry in the market for Pig Lead with prices showing little change since the date of last report.

Spelter.—The Spelter market is rather confused. The shortage of Ores a week ago resulted in two of the large concerns bidding against each other, with the result of sending prices upward. This competition has now stopped and consumers have not as yet come in for their regular supplies, consequently it is a waiting game to see whether a fresh demand keeps prices up, or whether the consumers can wait to see prices recede. The market continues firm. Small lots of good Western brands rule at about 4.60c. to 4.70c. per lb. St. Louis advices report the demand for Spelter in that market to have quieted down considerably, while prices have receded somewhat.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions. Prices are unchanged at 6¾c. per lb. for 600-lb. lots and 7c. to 7¼c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S., 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—The situation in regard to this metal is unchanged. Small lots are quoted at 55c. per lb.

Aluminum.—Demand continues good and prices unchanged from their former level. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market is unchanged and without interesting developments of any kind. The mills are understood to be running to full capacity, and shipping their product as fast as made in fulfillment of old contracts. New business is said to be rather light, however, the heavy spring and early summer trade not having yet opened. A slight revival in the demand from the smaller consumers was noted this week, due to the improvement in the weather. Prices are without change. American Bessemer Coke Plates, IC, 14 x 20, are quoted at about $4.85 to $4.95 per box for small lots delivered at New York or corresponding points.

Sheets.—The Sheet trade is said to be in a very satisfactory condition, the demand keeping up in heavy volume for both Black and Galvanized Sheets. Prices, however, are on a very profitable basis, and jobbers report that better deliveries can be obtained on the lighter gauges of Black Sheets than on the heavier gauges and on Galvanized. Retail prices are firm and unchanged. Jobers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at about 3.85c. to 3.90c., and Galvanized Sheets at 70 to 70 and 2½ per cent. off the list. A new departure has just been made by the American Sheet Steel Company. The company announced that from April 1 they would make their quotations on Galvanized Sheets to jobbers and large consumers at net prices instead of naming a discount off the list. For many years past Galvanized Sheets have been sold from a list which has always been far above the actual prices which have ruled on this material. The change is regarded with approval by the trade generally. The jobbers and dealers generally have not yet made a change in their methods of quoting Galvanizd Sheets to their customers, but it is likely that they all will in time follow the practice of the manufacturers in this matter. It was at one time found advantageous to have a list price for Galvanized Sheets, as the values fluctuated materially, especially when there was more competition than there has been since the American Sheet Steel Company absorbed the majority of the mills making this line of goods. But prices of late have ranged within such comparatively small limits that the convenience of having a list from which discounts could be quoted was no longer felt. The change in practice made by the American Sheet Steel Company will probably commend itself to both the wholesale and the retail trade, as well as to consumers, as tending toward greater simplicity and definiteness in quotations.

Chicago advices are as follows: The demand is excellent, an increase in orders being particularly noticeable in Black Sheets. Heavy gauges are still hard to get, the mills being from six to ten weeks behind on deliveries, and prices of Nos. 10 to 16 are strong, with an upward tendency. Galvanized Sheets are now quoted at net prices, small lots from store being held at 4.70c. to 4.75c. for No. 27, Chicago.

Old Metals.—The demand for Scrap Metals of all kinds is not active and prices are rather weak. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10 c.
Light and Tinned Copper	per lb. 8¾c.
Heavy Brass	per lb. 8 c.
Light Brass	per lb. 6½c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3⅜c.
Zinc	per lb. 3 c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 16½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	9.00 to 9.50
Burnt Iron, per gross ton	7.00 to 7.50

THE PIG IRON MARKET.

New York.—The market continues quiet, but exceedingly strong, and prices for prompt Iron are advancing. In fact, the market is stiffening for later deliveries. We quote for forward delivery, Northern Irons: No. 1, $20.50 to $21; No. 2 X, $19.25 to $19.75; No. 2 Plain, $18.75 to $19.50, at tidewater. Tennessee and Alabama brands are as follows: No. 1 Foundry, $16.75, the official quotation for early delivery, $19.50 to $20.50; No. 2 Foundry, $15.75, the official quotation for early delivery, $18.75 to $19.

Chicago.—Current orders for Pig Iron form a fair aggregate, but the business is by no means as large as that prevailing last month. The leading consumers have pretty well covered their requirements for the last half of the year, although there are still some who are taking their chances of being able to purchase at better prices a few weeks or months hence. It is difficult to quote prices at present, as a wide range prevails between schedule prices and those realized on prompt shipments, or even on such Iron as can be purchased for future delivery. The schedule of the leading Southern companies have not been changed from $12, Birmingham, for No. 2 Foundry, but contracts are being placed at $3 higher by some of the outside companies. Prices on local Iron are also normal and unchanged, but sales for early shipments are made at higher rates. Our quotations must, therefore, be considered largely nominal. We quote as follows:

Lake Superior Charcoal	$21.50 to $22.25
Local Coke Foundry, No. 1	19.00 to 19.50
Local Coke Foundry, No. 2	18.50 to 19.00
Local Coke Foundry, No. 3	18.00 to 18.50
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	20.10 to 20.35
Southern Silvery, according to Silicon	16.90 to 19.15
Southern Coke, No. 1	16.40 to 18.65
Southern Coke, No. 2	15.65 to 18.15
Southern Coke, No. 3	15.15 to 17.65
Southern Coke, No. 1 Soft	16.40 to 18.65
Southern Coke, No. 2 Soft	15.65 to 18.15

Philadelphia.—The volume of business has diminished considerably during the past few days. Large consumers appear to be well covered for some time to come, so that the immediate demand is from small buyers, or those who have been disappointed, and are compelled to buy to tide over an emergency. There is a good deal of business of this kind. Sales have been within the limits named herewith. Occasional lots, due to special emergencies, have sold as high as $21 for No. 2 Foundry, but ordinarily about $1 less would be a fair average. Present prices will be about as follows for Philadelphia and nearby points:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$20.50 to $21.50	$20.00 to $21.00
No. 2 X Foundry	19.75 to 20.50	18.50 to 19.00
No. 2, Plain	18.75 to 19.00	17.50 to 18.00

Pittsburgh.—No large lots of Pig Iron are being sold, mainly for the reason that the Iron cannot be had. Prices on Pig Iron are steadily advancing, and heavy premiums are being paid for Foundry Iron. The foundries are being held responsible for the advance in prices on Pig Iron, as it is said they are buying in excess of their actual requirements. No. 2 Foundry for reasonably prompt delivery, is about $21, Pittsburgh.

St. Louis.—No new features came up this week in the Pig Iron situation. Sales and inquiry are now said to be running on a light scale. Spot Iron brings all sorts of figures. No. 1 Foundry is said to have sold recently at prices ranging from $18.50 to $19, and figures proportionately as high are being paid for other grades. Iron is very scarce and will continue so for a while, as the furnaces, with but few exceptions, are sold for July, and are not authorizing heavy bookings for that month. We quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $19.00
Southern, No. 2 Foundry	15.25 to 18.25
Southern, No. 3 Foundry	14.75 to 17.75
Southern, No. 4 Foundry	14.25 to 17.25
No. 1 Soft	15.75 to 18.75
No. 2 Soft	15.25 to 18.75

CHICAGO REPORT.

Scrap Iron and Steel.—The demand has fallen off considerably, while the supply seems to be increasing. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 8.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Business is quiet. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.60c.
Tea Lead	3.25c.
Zinc	2.75c.
Tin Foil	18 c.
Pewter, No. 1	15 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—Dealers report trade light and stocks plentiful. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6⅛c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—The supply is still in excess of the demand. Good Country Mixed Rags, Chicago delivery, 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—Trade is very brisk, buyers taking advantage of the low price to cover their wants for next winter. A discount of 50c. is allowed on the following schedule for all coal shipped in April:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

Paxton Hardware Mfg. Company, Paxton, Ill., are sending out a catalogue and price-list of Kitchen and House Furnishing Hardware, comprising Paxton Roaster and Baker, Prairie State Roaster and Baker, Lebanon Cake Cutter, Magnet Broom Holder, Lebanon Broiler, Combination Holder, Egg Beater and Potato Masher, Campers' or Portable Oven, Abell Coffee Pot, Combined Grater and Slaw Cutter, Enameled Repair Knob, Automatic Rope Attachment, Oriental Coffee Pot, Automatic Fire Proof Flue Stopper, Ventilating Stove Pipe Collar and Thimble combined, Fruit Jar Wrench, Paxton Poacher and Steamer, &c.

THE HARDWARE TRADE.

Reports indicate that trade throughout the country is in excellent condition and large volume. It is, however, feeling to some extent the effect of the spring activities. Travelers agree in reporting that labor throughout the country is so well employed and new enterprises are being so liberally projected that the stores generally are doing a large and profitable business. It is evident, too, that building during the season will be active. Prices on practically all lines of Hardware are firmly maintained, and in many departments there is an upward tendency. This condition is illustrated by the advance made during the past week in the price of Builders' Hardware. The difficulty experienced in obtaining many goods as promptly as the demands of the trade require gives additional firmness to values. The matter of jobbing consolidation has naturally been the subject of much discussion, and the different departments of the trade are canvassing it in the light of their individual interests. Export business is in very satisfactory shape, and the receipt of large and varied orders from foreign buyers is reported. In some lines the relatively high prices ruling in the home market have the effect of diminishing the amount of export business, but on the whole there is an increasing volume and an enlarging variety of Hardware and metal products going abroad. There is comparatively little complaint in regard to collections, and the financial situation of the trade in general is regarded as eminently satisfactory. It seems probable that the excellent record made by the opening months of the year will be continued, and the trade are looking forward to a large and profitable business during the remainder of the year.

NOTES ON PRICES.

Plumbers' Supplies.—New York jobbers say that the demand for Plumbing Supplies from the out of town trade has been exceptionally strong up to the present time. It is feared the journeymen in the outside districts are about to inaugurate a system of strikes which will harass the trade as it was never troubled heretofore. Already the towns along the Jersey shore are suffering from the strikes, and unless matters are promptly adjusted the business in that section will be spoilt for this spring and summer. It is to anticipate this trouble that the season's sales have been so voluminous at this early date. The business transacted so far this year is much greater than that of any previous year up to this time.

Sanitary Earthen Ware.—The Sanitary Potters' Association, according to all reports, have at last succeeded in bringing the trade into a profitable and stable position. This was done despite the fact that three manufacturing plants kept outside the association. The members of the association refuse to sell any of their wares to jobbing houses who persist in taking any of the products of the outside potteries. One large jobbing house in Pennsylvania have been taking the output of one of the outside plants, but as the supply house have a very large line of high grade and special pattern Closets, they were recently put to considerable annoyance by being refused further shipments of these special goods, which are made entirely by members of the Sanitary Potters' Association, who insist upon the jobbing house taking their entire wants from the association members alone. Prices of Sanitary Ware are very firm.

Wrought Iron Pipe.—Dealers in the entire metropolitan section are holding the prices of Wrought Iron and Steel Pipe very stiff.

Roofing Materials.—In another column we give details of the recent combination of the manufacturers of Coal Tar Products under the name of the Coal Tar Products Association of the United States of America, who have joined forces to regulate and advance prices in this line of goods. As the result, an average increase of approximately 20 per cent. has been made on Tarred Felts and Roofing Materials of this character.

Joseph T. Ryerson & Son, Chicago, are sending out what they term a "Bargain Bulletin," giving a list of odd sizes and lots of Black and Galvanized Sheets, Plates and Rivets, Boiler Tubes, &c., which they are closing out at reduced prices, to make room for regular stock.

Wire Nails.—The Wire Nail market continues in excellent condition. The volume of business is large and is expected to continue so for some time to come. There is some scarcity in the local market, owing to delays in deliveries, and dealers' assortments are somewhat broken. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—Notwithstanding the fact that the price of Cut Nails is substantially the same as that of Wire Nails, there is a good demand for the former, and the mills, in fact, are unable to make prompt shipments. The trade in New York and territory is now in a very satisfactory condition, and with the large amount of building in progress and projected an active demand for Nails is likely to continue. Small lots of Cut Nails from store are quoted at $2.25 to $2.30 per keg.

Window Glass.—Following the conference between the National Window Glass Jobbers' Association, the American Window Glass Company and the Federation Window Glass Company, an advance of about 5 per cent. was made in the price of Window Glass by jobbers, which was considerably below the advance made to the jobbers by the manufacturers, which amounted to an average of about 13½ per cent. It was deemed best, however, by the jobbers to make only a moderate advance at this time, and to raise prices gradually as conditions would warrant.

White Lead.—No extensive movement in the way of new orders for White Lead in Oil has taken place during the week. With settled weather an increase in the daily consumption is expected to follow, and the outlook is favorable for an active season. Prices are firm and without change, small quantities being sold at 6½ to 6¾ cents per pound.

Linseed Oil.—The demand for Linseed Oil is restricted to comparatively small lots for immediate delivery, and the market appears firm at present prices, as sellers decline to make concessions to secure business. Small lots of City Raw are quoted at 64 to 64½ cents per gallon. Boiled Oil is 2 cents advance on Raw.

Spirits Turpentine.—A stronger market for Turpentine is reported from the South, as a result of surplus stocks being reduced and light receipts. At this point a fair business is doing in small lots, with a larger demand anticipated. Small lots of Turpentine are quoted about ½ cent higher than a week ago—viz., at 46½ to 47 cents per gallon.

Sad Irons.—Manufacturers of Sad Irons have advanced prices on these goods ⅛ cent a pound.

Builders' Hardware.—At a meeting last week the manufacturers of Builders' Hardware made a general advance of 20 per cent. On some goods, however, such as common Door Locks and Sliding Door Sets, the advance was not as heavy as on the general line. There is a disposition on the part of the manufacturers to maintain the new prices firmly, and the market on this class of goods is regarded as on the whole in excellent condition. The volume of business is large and the manufacturers are behind their orders.

TRADE NOTES.

The General Foundry Company is the title of a new concern at Gardner, Mass., in which Gustave Hoglund, for many years connected with the Central Oil Gas Stove Company, and several of the stockholders in the Simplex Time Recorder Company are interested. The company will build a foundry, 40 x 80 feet, electricity being used for power purposes.

The Ohio Iron & Metal Company have been incorporated at Chicago, with a capital stock of $50,000. The incorporators are Moses Dreyfus, Samuel Deutsch and Albert S. Lour. This is the incorporation of an established business in Old Material which has been conducted by the same parties in the Stock Exchange Building, Chicago, for several years.

The Osborn Mfg. Company, Cleveland, Ohio, have just issued a new catalogue, No. 90, covering Steel Wire, Bristle and Fiber Brushes and Brooms, Foundry Supplies and Hardware Specialties. It contains more than 100 pages, most of which are devoted to the very extensive line of Brushes and Brooms which they manufacture.

Strain & Hill have succeeded J. O. Strain in the Hardware, Stove and Farm Implement business in Jamestown, Kan.

New Incandescent Bulb.

E. E. Rines, an electrician, of Indianapolis, Ind., has invented an incandescent bulb by which the degree of illumination may be varied. Mr. Rines has been working on this device for a number of years, and claims to have now produced a lamp that is a perfect success. The invention is specially designed for dwellings, hotels and hospitals. It consists of an ordinary 16 candle power globe so arranged that it may be turned to use 8, 4 or 2 candle power, which is accomplished by using connections that are different from the old style and two filaments. By turning the globe a little the light may be reduced from 16 to 8 candle power; a further turn reduces it to 4, and still further to 2. Then, if it is desired to have 16 candle power again, a turn back makes the light bright again. Mr. Rines is a graduate of Cooper Institute and Columbia University, New York, and has been employed for a number of years with Thomas A. Edison.

An Acetylene Insect Trap.

M. Noël, director of the entymological laboratory at Rouen, France, is the inventor of a simple acetylene trap for catching all varieties of winged insects and moths, which, flying by night, do much damage, in their larval state, to agriculture. At a position in a field or orchard where the insects mostly congregate, a stand consisting of four posts driven into the ground, is erected in such a way as to support a barrel about 3 feet above the earth. The head of the barrel is knocked out, and the inside of the bottom coated with tin foil. It is laid on its side with the bunghole open and pointing upward. In the inside is placed a small acetylene lamp, the top of the lamp chimney being covered with metal gauze to prevent the moths getting in and perhaps extinguishing the light. A small acetylene burner is placed inside the cask, with the generator arranged somewhere underneath. Toward evening the interior surface of the cask is painted with molasses, and at dusk the lamp is lighted. The open bunghole allows the heat to escape, and the tin foil on the bottom acts as a reflector. The moths are attracted by the light, and are immediately caught by the sticky sides of the barrel. Each morning the apparatus can be cleaned out ready for use another day. This trap is employed from about the middle of May to the middle of June, at which time the destructive insects are most in evidence.

A telegram received by the American School of Correspondence, Boston, Mass., from the superintendent of an electric plant in one of the sections affected by the recent flood, requested information regarding the treatment of dynamos that have been submerged. An immediate reply was sent by wire, followed by fuller details by mail, so that, by the time the water had subsided enough to permit work, the superintendent was placed in possession of information as to what should be done. The American School of Correspondence has a special inquiry department for answering practical engineering questions such as this.

We have received from the Hampton Normal and Agricultural Institute of Hampton, Va., an invitation to be present at the thirty-fourth anniversary exercises of the institute, to be held in the gymnasium on Wednesday, April 23, when an address will be delivered by Governor A. J. Montague of Virginia. On Tuesday, April 22, a conference on "Southern Education" will be held at the institute, at which addresses are to be made by Rev. Paul R. Frothingham, Dr. Felix Adler, Dr. Albert Shaw, Dr. L. H. Bailey, Dr. Hamilton W. Mabie, Dr. Talcott Williams and other distinguished speakers.

The New York district of the National Foundrymen's Association, at a special meeting, held in New York City on Monday, decided to refuse the demand of the union iron molders for a nine-hour day. About 6000 workmen are affected.

MEURER'S METAL SPANISH TILE

Made of Tin Plate, Galvanized Iron, Aluminum Coated Steel, and Copper.

WHY—Metal Tile are better than Terra Cotta.

BECAUSE—They make a lighter roof, allow for contraction and expansion, are fireproof, cannot become loosened and fall, and resemble them so closely in appearance that no one can tell the difference.

WHY—*MEURER'S METAL SPANISH TILE* are the best made.

BECAUSE—They are the only Tile with a secure lock that cannot spring apart.

Ceiling Truths

To **The Berger Manufacturing Company** belongs, exclusively, the honor of originating and placing upon the market complete classified designs of Metal Ceilings. Each classified design follows a definite and established form of architectural or decorative art, and each individual detail, whether of field plate, border, cove, filler, side wall, or wainscot is fully in accord with the artistic motive selected.

Now, that the meritorious features of

BERGER'S "Classik" CEILINGS

BERGER'S Classik TRADE MARK METAL CEILINGS

have pushed them to the front and up-to-date merchants give them preference, it is evident to all observing readers that our predictions of the past are being verified, and competing manufacturers, recognizing the advantage of **"Berger's Classik Metal Ceilings,"** are bringing out a few more-or-less classical designs in a vain endeavor to follow our footsteps.

We will still be found heading the procession. Our line is not only by far the most complete and comprehensive, but we are steadily adding to it, thus further increasing the already safe distance by which we lead.

If you want information about Metal Ceilings, ask us—we can tell you.

The Berger Manufacturing Company,

CANTON, OHIO.

New York Office: 210 East 23rd St., New York, N.Y.

LITTLEFORD BROTHERS,
453-55-57 Pearl Street, - CINCINNATI, O.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER
THE DOUBLE TRUSS CORNICE BRAKE CO.

New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

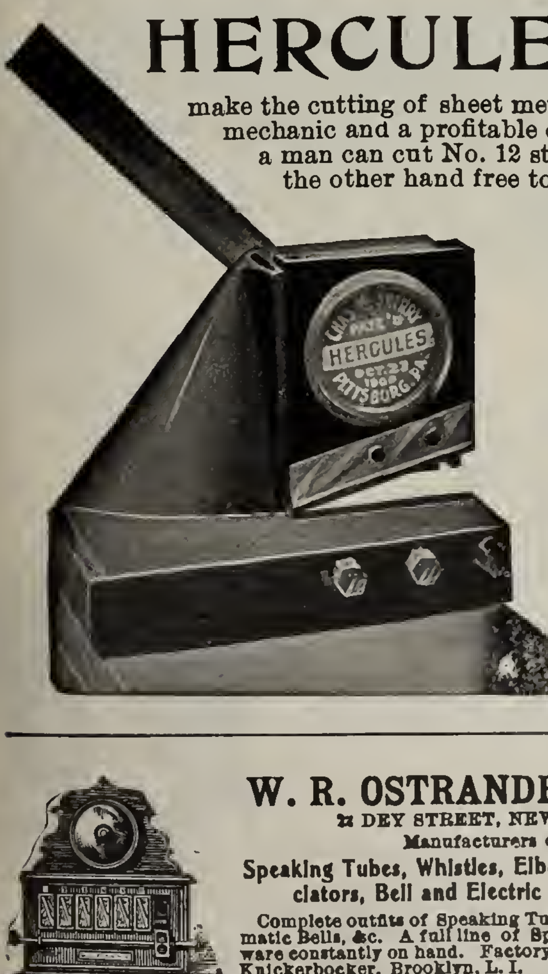
HERCULES SHEARS



make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

Front Rank Hot Air Furnaces
are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

Moore's QUICK OVEN Stoves

HUSTLES HIM TO WASH HIS FACE

Mr. B. J. Norby of Cassville, Mo., writes as follows:

> "One of the Steel Stoves recently ordered was for Editor Charles Ray. He is very much pleased with it. Mrs. Ray thinks that there is no other worth having. She says it bakes so quickly that her husband hardly has time to wash his face before breakfast is ready."

The kind of satisfaction shown in this letter is the kind that counts big for future business. It reaches the neighbors and friends, and in the end makes many sales.

MOORE'S QUICK OVEN STEEL STOVES give this kind of satisfaction in abundance. That's what makes them

"The Easy Line to Sell."

The Best Test

Of a furnace, with reference to its heating power, is the amount of space it will heat with a given amount of fuel under a proper state of combustion. We make the distinct claim for our

Magee Cottage Furnace

of superiority in this respect over any and all furnaces where a high grade furnace at a low price is desired. It is not offered in competition with inferior grades, designed especially for the cheapest class of work, but is a construction from which the greatest amount of heat can be obtained from the least amount of fuel, and at the same time add to your reputation.

Send for Catalogue.

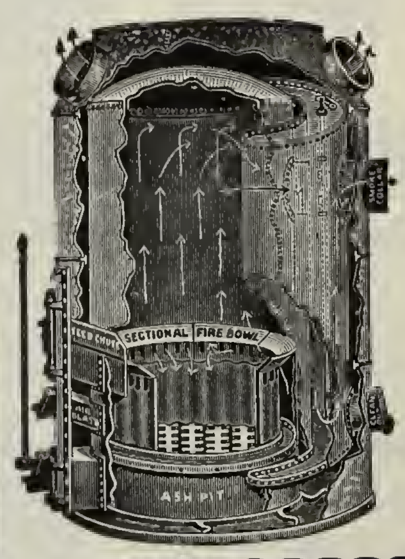
The Torrid Zone Furnace



is a trade winner because it has points of merit peculiar to itself that can be found in no other steel furnace. Our new catalogue is now ready to mail and a description of our Hot Air and Hot Water Combination Furnace can be seen in it. We furnish either the cast iron lining or the fire brick at the same price. Our Wood Furnace is called a powerful heater by those who use it.

The Climax
RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2⅛ in. die, $10.00.

No 2 threads 1 to 2 in. pipe, takes 2⅛, 3 and 4 in. die, $17.00

Index to Reading Matter....Page 56

A Problem of Business.

An old adage has it that "Competition is the life of trade," and under some modern conditions it might well be added, "and death to tradesmen." Where competition is sharp the profits are naturally small and dangerous, particularly to such as are engaged in those branches of the building trades which flourish best in special seasons, and which have their dull seasons. In these trades, a sufficient profit must be made during the active season to tide the business over the dull season. There is such sharpness in modern competition that the profits are often pared below the margin of safety. This affects the large manufacturer who markets his products through the jobber, as well as the conservative tradesman, who has to compete with those who, through lack of business experience, are apt to underestimate the cost and bid too low on work. Those who bid too low on work often use the pretext of quick sales and small profits. There are some branches of business that cannot be conducted along these lines, and those who attempt it are a menace to all concerned in these trades. These men demoralize the local buyers by establishing lower prices and creating a demand for these low prices which cannot be met by men who conduct their business properly, pay their bills, and desire to live in such a manner as a substantial tradesman has the right to live. It is a matter of common knowledge in the business world that those who bid too low invariably secure larger credit than should be extended to them, and their slowness in paying bills is a great hardship to the jobber. This class of trade not only demoralizes its local competitors, but from it many jobbers have received financial blows from which it has taken them years to recover. And instances are not wanting where jobbers who have catered to this class of trade have made failures, bringing home to the manufacturer losses which were felt by the small dealer first. Wherever the interests of the trade as a whole do not suffer the utmost freedom in the conduct of trade is to be commended. On the other hand, wherever local competition is of a character that interferes with the conservative tradesman who pays his bills regularly and does first-class work, there must be little objection to such restrictions in the extension of credit and other details of trading as will protect the local tradesmen. This is the character of trade protection which is maintained by the most reliable houses in all branches of business. The success of a business house depends on securing a reasonable profit from its sales, so that through the various mazes of the trade, from the smallest dealer to the largest manufacturer, all bills may be paid and ultimate failures in any branch be avoided.

B. Frank Hooper.

In the death of B. Frank Hooper the business world, in which he was a prominent figure, suffers a loss that it can ill afford. The position held by Mr. Hooper was unique in that he enjoyed the perfect confidence not only of his *confrères* and competitors in the trade, but also of his customers. His acquaintance was not confined to any section. He was well known and held in high esteem wherever the problems of the plumbing trade were discussed, either by manufacturers, dealers or plumbers. This feeling of perfect confidence in the man was largely due to his efforts to better the condition of all tradesmen with whom he came in contact and his utter freedom from selfish or ambitious motives. He was possessed of a generous, frank, open character, and had the happy faculty of seeing a satisfactory way out of the most intricate trade complications, in which different interests seemed to clash. He took a broad view of things, and had the capacity for handling large interests successfully and in a manner which inspired great confidence in his business judgment, a confidence that was always justified. Much of his success in preserving harmony in trade councils was due to his ability to induce those interested to take a liberal and common sense view of the conditions, and to secure their willingness to make such concessions as he judged necessary to the furtherance of their mutual interests. Those who knew Frank Hooper best feel that his removal leaves vacant a place that will be exceedingly difficult to fill. A study of the characteristics which marked his career should be an incentive to their adoption by those who remain, so that the results of his labors may be continued. His record should influence all branches of the trade to approach perplexing questions in the same unselfish, common sense spirit that was customary with him, and to endeavor to adjust them in a spirit of fairness to all concerned. No better tribute to his memory can be paid by the interests which he represented than to follow the example which he set.

The Sanitary Improvement of Havana.

The sanitary regeneration of Havana seems to be going on most satisfactorily under the guidance of the Military Governor, General Leonard Wood, and the active management of Major Gorgas, the chief sanitary officer. A report recently issued shows that in the three years of American occupation the city of Havana has been transformed from a hot bed of disease and death into a municipality which, in its sanitary aspects, compares favorably with any large city of the United States. The figures supplied by Major Gorgas are really remarkable. In the last year of Spanish occupation there were 21,252 deaths in Havana, a rate of 91.03 per thousand. In 1899, the first year of American occupation, the death rate had fallen to 33.67 per thousand. So successful has been the conflict with disease and death in subsequent years that the deaths for February last indicated an annual rate of only 17.06 per thousand. This is a smaller death rate than that of New York, Baltimore or London, England. A further remarkable proof of the change that has come over the sanitary character of Havana is the statement that in the past six months there has not been a single case of yellow fever in that city, which lends substance to the expressed belief of the American sanitary authorities that that scourge has been eradicated from Havana, which in former years was one of its strongholds.

An Age Limit for Labor?

A short time since the question of an age limit for labor was brought up at a meeting of the Chicago branch of the American Federation of Labor, resulting in an active discussion, in the course of which considerable heat was developed. The assertion was made by several members that it was becoming a practice with many employers of labor not only to decline to take on men of, or past, middle age, but to discharge such employees as had reached 45 years, or thereabouts, for the purpose of filling their places with younger men. Some of those present said that they had been obliged to dye their hair when it was turning gray, to cut off their whitening beards and discard their spectacles, when seeking work, so as to make themselves look young enough to secure employment. Otherwise, they claimed, they could have no hope of getting a job. Probably there is some basis of truth in this assertion. Some employers may think it good policy to rid themselves of the older men, for the purpose of taking on young men. But it is doubtful whether such action is at all widely followed, because it is not in line with the hard headed common sense which usually characterizes the American employer. Leaving all sentiment out of the account, we believe that few employers will be found willing to discard old and experienced workmen, who are competent to perform their duties, in favor of untried youths. A workman who is worth his wages will seldom find it hard to secure employment in this country, no matter what may be his age. A possible explanation of the thing is that, after reaching middle age, some workmen lose much of their energy and ability, and, being without ambition, are content to settle down into a dull routine, which inevitably results in a deterioration of the quality of their work. Notwithstanding the fact that there is a large demand for young men to-day in all lines of effort, it is hard to believe that the older men, who are competent to do their work, are being displaced to make room for younger men, simply for the reason that the other men are younger. It goes without saying that the experience gained in any line of business or industry, which comes only after years of service, must be regarded by all intelligent employers of labor as one of the most valuable assets of their employees.

The Controversy Over Wireless Telegraphy.

Thus early in its history wireless telegraphy is encountering opposition from rival claimants for its ownership, or priority of discovery. Marconi—the present only commercially successful operator—is declared to have usurped the plans of Dr. Slaby, who institutes an interference. But Prof. Sylvanus Thompson has published an article in the *Saturday Review* of London in which he asserts that neither Marconi nor Slaby have any rights of discovery in wireless telegraphy, as they cannot send a message across the Atlantic without using an apparatus known as a coherer to relay the Hertzian waves, and both employ an automatic tapper. Prof. Oliver Lodge of England, is declared to be the inventor of these devices, and both Marconi and Slaby are said to have appropriated them. Professor Lodge, principal of the University of Birmingham, England, first expounded the basic principles of wireless telegraphy in 1894, and is ignored by both of the other contestants for the ownership, but he is master of the situation, says Professor Thompson, from the fact that he holds foundation patents in this country for the details essential to success. Without meaning to traverse Professor Thompson's opinion, it is well known that priority of discovery as regards inventions is one of the most difficult things to establish. History is full of examples where the first person to establish any device and put it to commercial use has been protected and rewarded, while the alleged real inventor has reaped no reward. Ericsson was not the original discoverer of the revolving turrent, neither was Fulton the first person to make a vessel travel by steam power; George Stephenson was not the inventor of the link motion which is in universal use to-day and bearing his name, and it would not be at all remarkable if Marconi is declared to be the owner of practical wireless telegraphy. If litigation ensues experts in patent law will be in great demand for a few years.

The South American Market.

There is little doubt that there is an opportunity for American manufacturers to secure a better position in South American markets. This is a field in which less effort has been made than the importance of the market justifies. It is, indeed, undoubtedly true that even the great markets of the Old World and the Colonies have not been cultivated with as much care as they deserved, but to South America there has been accorded a larger measure of neglect. As a result the percentage of our business in these markets is proportionately smaller than in other quarters. It is true that in South America there is less willingness to take hold of new lines of goods than in many other fields, and it is consequently a matter of some labor to introduce them. When the trade, however, is established it is difficult to displace. There are some foreign fields which have something of the American spirit, in which change and novelties are regarded with favor, and there is a constant looking for something better. One of the fixed traits of the Spanish character is that if he finds an article suited to his needs he continues to call for it. Hence, trademarks and brands which find a place in such markets are valuable properties. If the trade of these countries is found difficult to obtain, there is, in view of this fact, a permanence in it when once secured which justifies vigorous and patient efforts on the part of our manufacturers to obtain a foothold and establish relations which promise to be not only permanent but large and profitable.

At the present rate of Italian immigration it would seem as if their country would soon be depopulated. In 1899 100,000 Italian immigrants landed in this country; last year this was increased to 140,000, and this year the number will amount to 200,000 at the present record. No effort has been made by the Italian Government to deport its surplus population, they come of their own accord, as the result of reports spread by those of their countrymen already here, and some who have returned to Italy. Within a decade the population of small cities near New York has been largely increased by Italians. As a rule, they are hard working, law abiding citizens in the rough, after they learn that liberty is not license.

WHAT A STOVE MAN SHOULD KNOW.

BY GRATE BAR.

I have read the very interesting articles in *The Metal Worker*, in reference to what furnacemen should know and what the furnace manufacturer should know, and feel satisfied that both should know more. My reflections on the information that should be possessed by my colleagues led me to select the title, " What a Stove Man Should Know," for the further diversion of the readers of *The Metal Worker*. It is not my intention to treat this subject exhaustively, for my modesty forces me to admit that I do not know it all, and I hope that others will supply what my contribution may lack.

A stove man should know, first of all, that to be successful he must maintain his reputation, both with his community and with the stove manufacturers. To do this the stoves he sells must be sold at a reasonable profit and only to people who will pay for them in cash and within a reasonable time. A reasonable profit does not mean 25 per cent. on the price given in the bill received from the manufacturer. There are other things to be added to that cost before the selling price can be determined. Every man should sit down and figure up what it costs him for rent, clerk hire, horse feed, postage stamps, light, heat and many other things during the year, and everything that he sells should bear its proportion of this expense. I am satisfied, from some of the competition that I am forced to meet, that some of my competitors do not know this. A stove man should surely know it. He should further know that so far as coal stoves are concerned the trade in them is limited to a comparatively few months, and that any stock which he carries over is money locked up, just as effectually as the pennies are in a youngster's savings bank, when he does not know how to open it. A stove man should know enough to select stock that will sell quickly and also not to buy more than he can dispose of in one season. He will not lose many sales if he is quick in paying his bills, uses the telegraph and telephone to advantage, and makes the stoves that he has sold to other people serve as samples to sell from. If, however, he loses the chance to sell three or four stoves on which he might make a profit of from $12 to $16 or $17, it is better to do so than to carry over a couple of hundred dollars' worth of stoves and lose in interest on the money, as well as the use of the money from having it tied up.

Many of the men who sell stoves in this country have occasion to repair them themselves in the latter part of the winter, when they cannot afford to keep all the help that they have had in the fall. This should lead them to select stoves so constructed that a new grate can readily be put into the stove, or a new fire pot, if it is a heating stove, or new fire bricks, fire back and oven plates, if it is a cooking stove. People do not expect to pay too much money for repairs, and if the stove man does not know enough to select stoves that can be repaired easily and quickly he will find his best customers his worst enemies and his own bad judgment a menace to the trade as well as to his profits.

The stove man should know enough to refuse to connect a good stove with a poor chimney. If the chimney is wrong insist that it shall be remedied before a new stove is connected with it. Otherwise a stove that is a winner may receive a black eye, and his competitor have the run on the stove trade that he has been enjoying. He should know better than to be economical in the size of the stove pipe. Use big pipe. Then the stoves will operate freely and there will be no trouble about selling a lot of dampers to regulate the drafts, and the owners of the stoves will have no complaint to make on account of poor operation.

The stove man should also know that the way iron is melted in the foundries is to mix the iron and coal in a cupola. This arrangement surrounds the pig iron with fire and the result is that it melts. If he thoroughly grasps this fact when somebody comes in and states that a grate was made of poor iron he can point out in a pleasant manner that the grate was made of as good iron as is ordinarily found in stove castings, and that it has been melted by exactly the same process that it was melted by in the first place when it was poured into the mold forming the grate. He can further explain that this condition in the stove was brought about by allowing the ashes to accumulate under the grate. Then when the fire is cleaned there are hot coals below and above the grate bar, and the draft makes it hot, yea, verily, exceedingly hot, for the grate bar, even to melting it.

◆

OPPOSED TO "ROTATING THE AIR."

That benefit is derived from a free discussion of the practice and methods followed in any line of work is unquestionable, and *The Metal Worker* is always glad to open its columns to the views of experienced men in regard to questions in which its readers are interested. While the interest in these views is intensified by their difference, it is better that the discussions be confined to practical explanations of what are considered defects, rather than to broad condemnation of them. The practice of rotating the air in furnace heating systems is too general to be stopped by denunciation alone, and notwithstanding that a strong tendency exists toward the enactment of laws providing for compulsory ventilation in public buildings, it is improbable that such laws will be made to govern dwellings, at least for many years. This is due to the opinion entertained by many well qualified persons that, in view of the large volume of air in dwellings in proportion to the occupants, it is not absolutely necessary to take air from the outside, owing to the freshening of the air inside through window crevices and the opening of doors. In most instances where the rotary system is used provision is also made for taking fresh air from out of doors when the temperature is not too low for economy and comfort. We present these suggestions for the consideration of those who read the communication from a Minneapolis correspondent given below, hoping that our suggestion as to the character of future discussion will be met in the spirit in which it is advanced. We shall be glad to present the practical article which our correspondent mentions. Our correspondent's letter is as follows:

When I awoke this morning early and heard the song of the robin, one of the harbingers of spring, it made my heart leap for joy to think that the time for the singing of birds had come. While it should have made me feel at peace with all the world, yet I could not forget the little item by " F. B. K." I read in *The Metal Worker* of April 5 in regard to the rotary system of heating, and the most annoying thing to me was that he was an Ohio man. I was an Ohio man for 35 years or more, and it hurt me to think that so many Ohioans had been imposed upon in this way.

I shall never forget the remark of an old furnace dealer, whose business has now become national and who knows how to do things to perfection, when he said to me some three years ago that his experience and observation convinced him that eight out of every ten furnacemen ought to be in the penitentiary. He meant those men particularly who gave instructions and those who did the work. The State has no law governing such cases, else, I am afraid, our friend would have found himself caged in. I am glad to know that Ohio claims such a man as Isaac D. Smead, whose ideas on heating and ventilating have revolutionized the whole country, and many others I know. It would pay our rotary man to take a course of instruction at the feet of some of these men.

It is one thing to install a system correctly and another thing to run it. Public buildings, and churches particularly, spend thousands of dollars in putting in excellent systems of heating and ventilating. Then they hire the cheapest janitor they can get and wonder why the system does not work. Again, look through the list of furnace makers and see what a variety there is. As every one of these manufacturers not only claims the best but wants agents in every place of importance and size, it can readily be seen that with the limited number of men who really know anything about heating, and especially ventilating, they must pick up a vast number of novices and inexperienced men to carry out their plans. The real care that many seem to have is to get years that the deaths for February last indicated an annual rate of only 17.06 per thousand. This is a smaller death rate than that of New York, Baltimore or London, England. A further remarkable proof of the change that has come over the sanitary character of Havana is the statement that in the past six months there has not been a single case of yellow fever in that city, which lends substance to the expressed belief of the American sanitary authorities that that scourge has been eradicated from Havana, which in former years was one of its strongholds.

An Age Limit for Labor?

A short time since the question of an age limit for labor was brought up at a meeting of the Chicago branch of the American Federation of Labor, resulting in an active discussion, in the course of which considerable heat was developed. The assertion was made by several members that it was becoming a practice with many employers of labor not only to decline to take on men of, or past, middle age, but to discharge such employees as had reached 45 years, or thereabouts, for the purpose of filling their places with younger men. Some of those present said that they had been obliged to dye their hair when it was turning gray, to cut off their whitening beards and discard their spectacles, when seeking work, so as to make themselves look young enough to secure employment. Otherwise, they claimed, they could have no hope of getting a job. Probably there is some basis of truth in this assertion. Some employers may think it good policy to rid themselves of the older men, for the purpose of taking on young men. But it is doubtful whether such action is at all widely followed, because it is not in line with the hard headed common sense which usually characterizes the American employer. Leaving all sentiment out of the account, we believe that few employers will be found willing to discard old and experienced workmen, who are competent to perform their duties, in favor of untried youths. A workman who is worth his wages will seldom find it hard to secure employment in this country, no matter what may be his age. A possible explanation of the thing is that, after reaching middle age, some workmen lose much of their energy and ability, and, being without ambition, are content to settle down into a dull routine, which inevitably results in a deterioration of the quality of their work. Notwithstanding the fact that there is a large demand for young men to-day in all lines of effort, it is hard to believe that the older men, who are competent to do their work, are being displaced to make room for younger men, simply for the reason that the other men are younger. It goes without saying that the experience gained in any line of business or industry, which comes only after years of service, must be regarded by all intelligent employers of labor as one of the most valuable assets of their employees.

The Controversy Over Wireless Telegraphy.

Thus early in its history wireless telegraphy is encountering opposition from rival claimants for its ownership, or priority of discovery. Marconi—the present only commercially successful operator—is declared to have usurped the plans of Dr. Slaby, who institutes an interference. But Prof. Sylvanus Thompson has published an article in the *Saturday Review* of London in which he asserts that neither Marconi nor Slaby have any rights of discovery in wireless telegraphy, as they cannot send a message across the Atlantic without using an apparatus known as a coherer to relay the Hertzian waves, and both employ an automatic tapper. Prof. Oliver Lodge of England, is declared to be the inventor of these devices, and both Marconi and Slaby are said to have appropriated them. Professor Lodge, principal of the University of Birmingham, England, first expounded the basic principles of wireless telegraphy in 1894, and is ignored by both of the other contestants for the ownership, but he is master of the situation, says Professor Thompson, from the fact that he holds foundation patents in this country for the details essential to success. Without meaning to traverse Professor Thompson's opinion, it is well known that priority of discovery as regards inventions is one of the most difficult things to establish. History is full of examples where the first person to establish any device and put it to commercial use has been protected and rewarded, while the alleged real inventor has reaped no reward. Ericsson was not the original discoverer of the revolving turrent, neither was Fulton the first person to make a vessel travel by steam power; George Stephenson was not the inventor of the link motion which is in universal use to-day and bearing his name, and it would not be at all remarkable if Marconi is declared to be the owner of practical wireless telegraphy. If litigation ensues experts in patent law will be in great demand for a few years.

The South American Market.

There is little doubt that there is an opportunity for American manufacturers to secure a better position in South American markets. This is a field in which less effort has been made than the importance of the market justifies. It is, indeed, undoubtedly true that even the great markets of the Old World and the Colonies have not been cultivated with as much care as they deserved, but to South America there has been accorded a larger measure of neglect. As a result the percentage of our business in these markets is proportionately smaller than in other quarters. It is true that in South America there is less willingness to take hold of new lines of goods than in many other fields, and it is consequently a matter of some labor to introduce them. When the trade, however, is established it is difficult to displace. There are some foreign fields which have something of the American spirit, in which change and novelties are regarded with favor, and there is a constant looking for something better. One of the fixed traits of the Spanish character is that if he finds an article suited to his needs he continues to call for it. Hence, trademarks and brands which find a place in such markets are valuable properties. If the trade of these countries is found difficult to obtain, there is, in view of this fact, a permanence in it when once secured which justifies vigorous and patient efforts on the part of our manufacturers to obtain a foothold and establish relations which promise to be not only permanent but large and profitable.

At the present rate of Italian immigration it would seem as if their country would soon be depopulated. In 1899 100,000 Italian immigrants landed in this country; last year this was increased to 140,000, and this year the number will amount to 200,000 at the present record. No effort has been made by the Italian Government to deport its surplus population, they come of their own accord, as the result of reports spread by those of their countrymen already here, and some who have returned to Italy. Then the stoves will operate freely and there will be no trouble about selling a lot of dampers to regulate the drafts, and the owners of the stoves will have no complaint to make on account of poor operation.

The stove man should also know that the way iron is melted in the foundries is to mix the iron and coal in a cupola. This arrangement surrounds the pig iron with fire and the result is that it melts. If he thoroughly grasps this fact when somebody comes in and states that a grate was made of poor iron he can point out in a pleasant manner that the grate was made of as good iron as is ordinarily found in stove castings, and that it has been melted by exactly the same process that it was melted by in the first place when it was poured into the mold forming the grate. He can further explain that this condition in the stove was brought about by allowing the ashes to accumulate under the grate. Then when the fire is cleaned there are hot coals below and above the grate bar, and the draft makes it hot, yea, verily, exceedingly hot, for the grate bar, even to melting it.

OPPOSED TO "ROTATING THE AIR."

That benefit is derived from a free discussion of the practice and methods followed in any line of work is unquestionable, and *The Metal Worker* is always glad to open its columns to the views of experienced men in regard to questions in which its readers are interested. While the interest in these views is intensified by their difference, it is better that the discussions be confined to practical explanations of what are considered defects, rather than to broad condemnation of them. The practice of rotating the air in furnace heating systems is too general to be stopped by denunciation alone, and notwithstanding that a strong tendency exists toward the enactment of laws providing for compulsory ventilation in public buildings, it is improbable that such laws will be made to govern dwellings, at least for many years. This is due to the opinion entertained by many well qualified persons that, in view of the large volume of air in dwellings in proportion to the occupants, it is not absolutely necessary to take air from the outside, owing to the freshening of the air inside through window crevices and the opening of doors. In most instances where the rotary system is used provision is also made for taking fresh air from out of doors when the temperature is not too low for economy and comfort. We present these suggestions for the consideration of those who read the communication from a Minneapolis correspondent given below, hoping that our suggestion as to the character of future discussion will be met in the spirit in which it is advanced. We shall be glad to present the practical article which our correspondent mentions. Our correspondent's letter is as follows:

When I awoke this morning early and heard the song of the robin, one of the harbingers of spring, it made my heart leap for joy to think that the time for the singing of birds had come. While it should have made me feel at peace with all the world, yet I could not forget the little item by "F. B. K." I read in *The Metal Worker* of April 5 in regard to the rotary system of heating, and the most annoying thing to me was that he was an Ohio man. I was an Ohio man for 35 years or more, and it hurt me to think that so many Ohioans had been imposed upon in this way.

I shall never forget the remark of an old furnace dealer, whose business has now become national and who knows how to do things to perfection, when he said to me some three years ago that his experience and observation convinced him that eight out of every ten furnacemen ought to be in the penitentiary. He meant those men particularly who gave instructions and those who did the work. The State has no law governing such cases, else, I am afraid, our friend would have found himself caged in. I am glad to know that Ohio claims such a man as Isaac D. Smead, whose ideas on heating and ventilating have revolutionized the whole country, and many others I know. It would pay our rotary man to take a course of instruction at the feet of some of these men.

It is one thing to install a system correctly and another thing to run it. Public buildings, and churches particularly, spend thousands of dollars in putting in excellent systems of heating and ventilating. Then they hire the cheapest janitor they can get and wonder why the system does not work. Again, look through the list of furnace makers and see what a variety there is. As every one of these manufacturers not only claims the best but wants agents in every place of importance and size, it can readily be seen that with the limited number of men who really know anything about heating, and especially ventilating, they must pick up a vast number of novices and inexperienced men to carry out their plans. The real care that many seem to have is to get rid of furnaces. To the average man a furnace is a furnace, and the cheapest generally goes.

"Confidential" of this city has a good level head, and opening your columns to a few more men of good ideas, even though it crosses the path of the rotary man, will make *The Metal Worker* more sought after than ever before. I have had experience in heating of which I might give you an instance, but this is already long enough. If agreeable to you I will give it in a later issue. I am for good, fresh air, first, last and all the time.

The Furnace Work Record.

Additional interest will attend the study of the data contained in the Furnace Work Record presented in this issue from the fact that the information given is of plants in the extreme East and West, and in one of which gas fuel has been used entirely. The wide interest that has been taken in the study of the data presented by the Record would appear to sufficiently demonstrate its value. It is through the Furnace Work Record that our readers are enabled to enjoy the excellent article on furnace heating presented in this issue by James A. Harding, who is well known to many in the furnace trade and a writer whose articles were read with close attention when presented in *The Metal Worker* several years ago.

The attention that has been given to the articles on furnace work which have appeared in *The Metal Worker* during the past few months is evidence that the furnace trade at large are deeply interested in the development of some method of figuring their work that will give more positive assurance of satisfactory results than those which have been employed in the past. That experienced men avoid errors is true, but it is not fair nor in keeping with the progress in other branches of the heating trade that the public who support furnace heating should be called upon to pay for the errors that are made by men in acquiring an experience which will enable the completion of successful work.

It may surprise many of our readers to know that the suggestion has been made that such articles as we have presented are liable to prove a disadvantage to the furnace trade, by impressing those who might otherwise engage in it with the idea that it is too complicated for them to understand, and that they would be apt to hesitate about taking up this branch of business, the sale of furnaces being thereby reduced. We cannot but feel that this is an illy considered opinion. Nothing could increase the popularity of furnace heating throughout the country more than a reduced percentage of unsatisfactory furnace systems.

Probably one of the best methods of securing a larger percentage of successful plants is to present the well formulated methods of procedure followed by men of long experience and successful practice. Under the old system a man without either was unable to design a furnace heating system, or he had to follow such advice as was available and abide by the results. Should it be possible to formulate a system of laying out furnace work with such rules as can be applied by any careful, practical business man, not only will a great gain be made, but much benefit should accrue to all who are interested in furnace heating.

It has been claimed that it is not necessary to consider some of the small details which have been taken into consideration in some of the articles, and that furnacemen will not enter upon such a laborious task. If success is to attend their practice these things must be considered by the furnacemen. It has been the experience of experts sent out by furnace manufacturers and of experts who are carrying on the furnace heating business that the majority of the failures that come to their attention are due to the neglect to take into account the various small items, or details which are considered laborious, which, if they had received proper attention when the plant was designed and installed, would have obviated the expense to the manufacturer, the owner and the furnace contractor of righting the errors made.

It often seems as if the expert gave no consideration to these little things, but it may be safely relied on that the careful and laborious consideration of these little details gave him the mastery of his business that makes the work which he designs successful. It is only after such study and training that he is enabled to reduce his methods to a simple system.

We hope that the use to which the columns of *The Metal Worker* have been put, and to which they are open, will result eventually in the formulation of a simple system that will enable all who are engaged in furnace setting to avoid the errors which have in many instances brought into disfavor this excellent method of heating houses.

FURNACE RULES AND CALCULATIONS.

BY JAMES A. HARDING.

While it is some time since I have written anything for publication, the subject presented in *The Metal Worker* Record of Furnace Work is of such general interest that I have felt constrained to devote a few hours to its consideration. I have noted upon a blank certain data under the various headings concerning a furnace plant installed last summer in a country house in the vicinity of Boston and present it herewith.

The desirability of a formula for determining the various proportions of a warm air furnace plant for a dwelling has often appealed to me, and I see no reason why such a formula, equally as accurate and satisfactory as those employed in steam and hot water heating, cannot be arrived at along the same lines of calculation.

The real basis of such calculations is the number of heat units available in the fuel. Each pound of good anthracite coal contains from 13,000 to 14,000 heat units; and in its consumption in a good steam or hot water heater it is generally proved that from each pound there will be 10,000 units of heat utilized—*i. e.*, disseminated in the apartments to be warmed.

I am of the opinion, based upon an experience of some years with the three types of heaters, that a good warm air furnace will assure the utilization of as large a proportion of the fuel consumed as a good steam or hot water heater—*i. e.*, 10,000 heat units per pound of coal. It thus becomes obvious that if we can determine the total heat units required for warming a house for a given period of time we can easily calculate the weight of coal required for that period.

Referring to the accompanying blank, you will note that the house in question, which is of the ordinary frame (wood) construction, contains 26,200 cubic feet of space, 2140 square feet of exposed wall surface and 573 square feet of glass surface. It has a cold air box 16 x 24 inches, and this box has been open to an extent of 12 x 16 inches, or 1 1-3 square feet, during the past winter. The velocity of the air entering the box has been, under average conditions, 5 feet per second.

We will assume that the usual contract was made to warm the house to 70 degrees in zero weather, therefore the furnace should be adequate to properly meet this condition for an extended period of time.

For a performance of 24 hours we will assume the average temperature of the whole house to be 65 degrees for 12 hours and 55 degrees for 12 hours, or 60 degrees for the whole 24 hours. One square foot of glass will dissipate 1 heat unit per hour per degree difference of temperature. Four square feet of exposed wall surface are equivalent to 1 square foot of glass, and the heating of 55 cubic feet of air is equivalent to 1 square foot of glass.

The glass and wall surfaces being known, we have to calculate the volume of air to be heated. It is determined to a very close approximation by many proved calculations and much experience that with the ordinary type of dwelling one and a half times its whole interior space in cubic feet of air per hour will find ingress through the incidental and accidental openings and crevices. This house contains 26,200 cubic feet of space, hence the air thus admitted will be 39,300 cubic feet per hour.

A cold air box of 1 1-3 square feet cross sectional area with an air velocity of 5 feet per second will admit 24,000 additional cubic feet of air per hour. Hence

THE METAL WORKER RECORD OF FURNACE WORK.

If this blank is filled out as shown by the example given below, it will serve as a valuable guide in planning other furnace jobs.

Building Heated.	Grate Surface.		Heating Surface.	Type of Furnace.	Coal Burned per Season.	Space Heated.	Outside Dimensions and Character of Building.	Wall Surface.	Number and Size of Windows. the total amount of air admitted will be 39,300 + 24,000 = 63,300 cubic feet per hour.

The average difference in temperature, as above, is 60 — 0 = 60 degrees.

	Square feet.
Glass surface.. =	573
Glass surface equivalent in exposed walls $\frac{2,140}{4}$........=	535
Glass surface equivalent in air admitted $\frac{63,300}{55}$..........=	1,151
Total equivalent glass surface or heat units dissipated per degree difference in temperature............=	2,259

2.259 × 60° = 135,540 total heat units required per hour.

$\frac{135,540}{10,000}$ = 13½ pounds of coal required per hour.

13½ × 24 = 324 pounds of coal required for 24 hours.

Having determined that 324 pounds of coal will be burned in 24 hours in zero weather, we are now in a position to determine the size of the fire pot (*i. e.*, the furnace). At this point I will venture the opinion that when even the best kind of furnace requires to be coaled oftener than three times in 24 hours, as this office is usually performed, it is working under the adverse condition of too rapid combustion, wastes coal and will not utilize 10,000 heat units per pound burned.

Let us assume three firings in 24 hours, or 108 pounds at each time, for a basis. A cubic foot of anthracite coal weighs about 50 pounds, hence $\frac{108}{50}$ = 2 1-6 cubic feet of space in fire pot required at each firing. The fire pot should be half full of coal after the grate is shaken each time; hence it should have 2 1-6 × 2 = 4 1-3 cubic feet capacity.

The average depth of furnace fire pots is about 1 foot, hence $\frac{4\ 1\text{-}3}{1}$ = 4 1-3 square feet (624 square inches) area, or 28 + inches diameter, or, with the usual shape of cast iron fire pot, say a 26-inch grate and 30-inch top diameter.

From the foregoing we establish a rule for determining the size of furnace (fire pot) required, as follows, viz.: Multiply the total glass surface equivalent by the average difference of temperature (indoors and out) and divide this product by 10,000. The result will be in pounds of coal per hour. Then divide the number of pounds required for eight hours by 50, double the quotient, and the result will be the cubic feet of space required in the fire pot.

I have purposely omitted consideration of several matters affecting the general result, such as north and west exposures, fire places, &c., with a view to confining myself to the observation of general principles; therefore to some extent the above rule will require correction.

I had purposed to take up the matter of pipes and registers, but will postpone its treatment as a special subject for a future paper.

STOVE ASSOCIATION NEWS.

The Southern Association of Stove Manufacturers are holding a meeting at Chattanooga, Tenn., this week, and it is expected that they will advance the prices of stoves 5 per cent.

The Ohio Valley Association of Stove Manufacturers met at Columbus, Ohio, on the 22d inst. and resolved to make an additional advance of 5 per cent. on cast stoves and ranges, having made one advance of 5 per cent. in March.

The New York stove manufacturers are quite generally advancing the prices of their goods where the margin of profit has been too small. The approach of the National Convention is occupying the attention of the local stove men, notwithstanding that the members, at the last convention, stated that they invited themselves to New York this year and expected no such generous entertainment as was dispensed two years ago.

The Gate City Stove Works of Catlettsburg, Ky., have increased their capital stock from $2000 to $10,000.

ODD PLATES.

The Shelby Stove Company of Shelby, Ohio, have received one order for 10,000 Stoves, and another for 2500. They are now producing Stoves at the rate of 100 a day, and are employing a large force of workmen.

The Carbon Stove Works are to be removed from Weissport to Lehighton, Pa., the Board of Trade of that place having offered a financial inducement.

The H. Adler Mfg. Company of Pittsburgh, Pa., have bought 5 acres of ground at West Carnegie, Pa., upon which they will erect a plant for the manufacture of Gas Stoves and Ranges. The new works will embrace seven buildings, including a foundry, 70 x 260 feet; construction room, 60 x 200 feet; warehouse, 60 x 200 feet; machine shop, packing room and press room, 50 x 100 feet. It is expected that the buildings will be completed by July.

The Great Western Stove Company, Leavenworth, Kan., have prepared plans for the erection of a six-story warehouse building at Omaha, Neb.

The Humbert Stove Company of Lower Turkeyfoot Township, Somerset County, Pa., have been incorporated with a capital stock of $10,000 by Irvin T. Huff, John C. Forsyth, F. A. Walker, Rufus King, Jr., and W. L. Brinton.

The Stamford Gas Stove Company of New York City have been incorporated with a capital of $60,000. The directors are W. Stewart Horner, Pittsburgh, Pa.; Warren Collins, College Point, N. Y., and Franklin Wardwell of Stamford, Conn.

The Stove trade will learn with regret of the death, on April 19, at his residence in Troy, N. Y., of A. Gould Millard, at the age of 57 years. Mr. Millard represented Rathbone, Sard & Co. of Albany, N. Y., on the road for 21 years, but at the time of his death he was connected with the Taunton Iron Works of Taunton, Mass. He was a member of the Masonic fraternity and several other societies. He is survived by his wife and two daughters.

J. M. Litchfield, manager of the New York branch of the Mt. Penn Stove Works of Reading, Pa., has secured the services of W. E. Russell, formerly with the Lehigh Stove Mfg. Company of Lehighton, Pa., to look after the interests of the Queen Esther and Penn Esther Stoves and Ranges in New England.

Lazard Kahn of F. & L. Kahn & Bros., Hamilton, Ohio, was a recent visitor among the Stove trade of New York. Naturally, from the frequent use of his name in the daily press in connection with the proposed consolidation of Stove manufacturers, Mr. Kahn had to answer many questions in reference to the consolidation scheme, which many expect to hear announced when the National Association of Stove Manufacturers meets in New York City on May 14.

After being out a week, the striking foundrymen at the Charleston Stove Company's plant at Charleston, Ill., resumed work this week, the company having conceded their demand for a 5 per cent. advance in wages. Seventy-five molders went out last week, causing the shut down of the plant.

Gruenhagen Brothers, St. Paul, Minn., are about to erect a new building for the manufacture of Stoves and for storage purposes on Dudley avenue, adjoining their present building. The new structure will be 66 x 100 feet, and will have three stories and basement. The cost will approximate $6000.

John B. Butler, a well-known business man of Troy, N. Y., died on April 6, at his home in that city, aged 64 years. He was born in Schagticoke, N. Y., and went to Troy when 19 years of age, shortly after which he engaged in the retail Stove business as a member of the firm of Williamson & Butler. Later Mr. Butler conducted a Stove and House Furnishing Goods store at 401 River street. He was a member of the Fifth Avenue Baptist Church, and was a man of sterling character, held in high esteem in business circles. He is survived by a widow, one son and two daughters.

National and Nesco Oil Cans.

The National Enameling & Stamping Company are now making, at their Baltimore factory, the National corrugated oil can, of which illustrations are given herewith. Fig. 1 represents the National oil can with stamped, fluted breasts, large screw caps of brass and a spout. These spouts are double seamed in the breasts and cannot be knocked off or staved in, which often happens with the old method of putting on spouts. The manufacturers state that these cans are made of the best quality of sheet steel and are galvanized after being put together. The corrugations of the bodies and breasts makes the cans much stronger and more durable than the plain ones. Fig. 2 shows the same can finished with an angle faucet instead of a spout. These cans are made of 1, 2, 3, 5 and 10 gallon capacity.

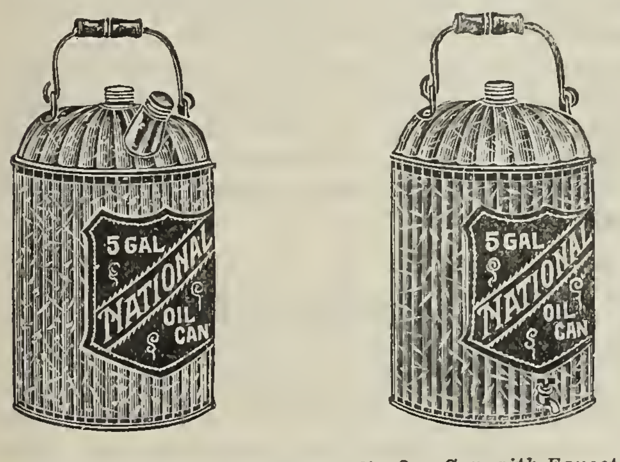

Fig. 1.—Can with Spout. *Fig. 2.—Can with Faucet.*

National Corrugated Oil Cans.

In Fig. 3 is shown the Nesco pump oil can, made of sheet steel, galvanized and corrugated. It is provided with an improved removable suction pump, with long spout made of one piece, which can be adjusted to fill any ordinary lamp. The general construction is similar to that of the National cans. Special attention is directed to the fact that the pump is jointless and admits of a continuous flow of oil. When the can is not in use, all the exposed parts are completely covered by a hinged dome cap. This style of can is made of 5 gallons capacity.

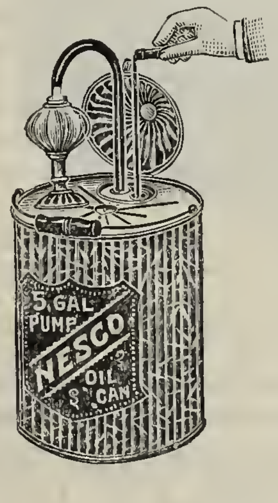

Fig. 3.—Nesco Pump Oil Can.

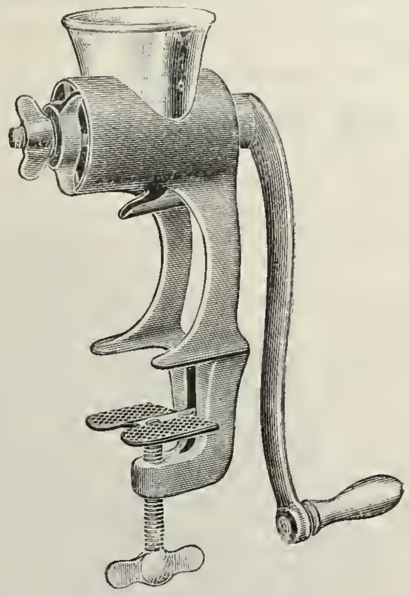
Compressed Air Washing Machine.

The Brooks Compressed Air Washer Company of Redwood Falls, Minn., will shortly move their entire plant and business to Minneapolis, where they will engage in the manufacture of their patent washing machines on a more extensive scale than ever before. For this purpose the owners of the machine have incorporated a company under the above title. The officers of the company are: J. W. Elliott, president; A. Clark, vice-president; M. E. Baum, treasurer; A. H. Nelson, secretary, and Dan Clark, manager. The company's washer differs from those now on the market, being based on a principle in which compressed air is used. Air and water are forced through the clothing, which process, the manufacturers claim, will clean the clothes in less time and more thoroughly than with the ordinary machine.

Classic Food Chopper.

The Griswold Mfg. Company, Erie, Pa., are putting on the market the new patent Classic food chopper, an illustration of which is given herewith. Two special points of excellence in this article are the drip spout, which carries the juice from the back of the cutter to the front into the dish, and the particularly effective table clamp with which the chopper is equipped. This is claimed to be a great improvement over the old round clamp, which chews the table and is very hard to make hold firmly. These choppers are made in two sizes, with a capacity of 2 pounds and 2½ pounds of meat per minute respectively. In designing the Classic chopper the company state that they endeavored to make as near perfect a machine as possible, embodying the best features found in others, with several valuable improvements. The face of the chopper being convex and the knife machined to exact fit, always seats the knife in the right place, giving a fine, clean cut. In cutting juicy fruits in the ordinary chopper, there is always some leak in the back end on to the floor. This is avoided by the patent drip spout attachment. All parts are made strictly interchangeable, and the castings are smooth and well tinned. The manufacturers claim that this machine does not mash or choke up, but cuts cleanly. It is adapted for use with all kinds of vegetables and fruits. Each chopper is furnished with three cutters—coarse, medium and fine. The weight of the No. 1 chopper is 4½ pounds, and of the No. 2, 5 pounds. They are furnished packed six in a case.



Classic Food Chopper.

Retail Hardware, Implement and Vehicle Association of the Indian Territory.

The third annual meeting of the Retail Hardware, Implement and Vehicle Association of the Indian Territory will be held at Vinita on Tuesday, May 13. In a circular issued by Sam R. Frazee, Vinita, secretary-treasurer of the association, urging dealers to attend the meeting, attention is called to the evils confronting the hardware, implement and vehicle trade in that section of the country, and the necessity for co-operation on the part of dealers in removing them. It is intimated that the association will this year affiliate with the National Retail Hardware Dealers' Association, thus putting them in a better position to correct the abuses from which they are suffering. Mr. Frazee states that a good programme has been prepared for the meeting, and that visitors, whether members or not, will find the occasion interesting and instructive.

New York State Retail Hardware Association.

The movement for the formation of a retail hardware association in New York State has taken definite shape, and a call for a meeting to form such an organization has just been issued by John R. Taylor of Little Falls, to whom great credit is due for the difficult and arduous preliminary work. The meeting for formal organization will be held at the Hotel Yates, Syracuse, on Monday and Tuesday, April 28 and 29. It is expected that M. L. Corey, the energetic and popular secretary of the National Retail Hardware Dealers' Association, will be present. Mr. Corey will be in a position to render effective service in connection with the work of organization. Over 200 retail hardware concerns in all parts of the State have signified their intention of joining the association, and some 40 more have expressed their approval of the project. While a preliminary meeting for general discussion will be held on Monday afternoon, the real work of the meeting will be done on Tuesday. It is therefore suggested that those who find it inconvenient or impossible to be present at both sessions will not remain away entirely on that account, but will attend on Tuesday.

Stove and Hardware Dealers.

Fred. W. Eberly, a member of the firm of Eberly's Sons, Stove dealers in Washington, D. C., died on April 11 at his home in that city. He leaves a widow and two children.

The Blacklock Foundry, South Pittsburgh, Tenn., have adopted a method for packing their goods which has met with generous approval from the trade. Most of their goods, having a more or less polished finish, are apt to rust. In order to avoid this and guard against loss to the dealer, the company wrap the small articles, such as Sad Irons, &c., in wax paper, over which is put the regular hardware paper. This prevents rusting and enables the dealer to handle them without loss.

The tin shop and Stove store of Jacob Otto, at 643 Penn street, Reading, Pa. was considerably damaged by fire last week.

Snider Bros. & Allen have succeeded Snider Bros. in the Hardware, Stove, Agricultural Implement, Sporting Goods and Furniture business, at Kalona, Iowa. They have a new wareroom, 32 x 50 feet.

August F. Mueller is successor to Huff & Mueller in the Hardware, Stove and Heating and Plumbing business in Webster City, Iowa.

W. S. Long has lately acquired the Hardware and Stove business formerly carried on by Haman & Neptune, Marquette, Neb.

H. G. King has sold his Hardware, Stove, Agricultural Implement and Buggy and Wagon business, at Mt. Union, Iowa, to Hillyard & Cornic.

Phil Scharf has succeeded Scharf & Morrison in the Hardware, Stove and Sporting Goods business in Newton, Iowa.

Harkins & Willis, Ann Arbor, Mich., are manufacturing Jim's Wire Cone Toaster, for toasting bread on a gas or gasoline stove. The device has a wire cone, which becomes red hot when placed over the flame. By laying the bread on the cone it can then be toaster quickly and evenly without smoke or smell. The manufacturers advise us that the demand for this Toaster has been very gratifying, both domestic and foreign, quite a number of them having been exported to England, Australia, Holland, Canada and other countries.

Peter Burger has just opened a new store in Madison, Wis., handling Shelf and Heavy Hardware, Tinware, Sporting Goods, Furnaces, &c. Mr. Burger will also conduct a repair shop.

Edward H. Kinney has recently been elected secretary of the Rochester Lamp Company, 38 Park place, New York, and is now in charge of the sales at this point. Mr. Kinney will be very favorably remembered by the Hardware and allied trades from his connection with the Iron Clad Mfg. Company up to two years ago, for a period of 20 years. The Rochester Lamp Company, under the direction of those now controlling their interests, have just established a new factory for the manufacture of their goods at Twenty-fifth street and Tenth avenue, New York. They will make in connection with the Rochester and New Rochester Lamps a complete line of staple Lamp goods as well as other metal specialties. The company have a new catalogue nearly ready for distribution, which will include new styles and lines of goods for the season of 1902.

Wm. H. Dolson, Fishkill Landing, N. Y., has just opened up in the Hardware and Stove business. Mr. Dolson would be pleased to have manufacturers send him copies of their catalogues, price-lists, &c.

Flintstone Hardware Company, Cumberland, Md., are a new concern handling Hardware, Farming Implements, Harness, Roofing, &c., at wholesale and retail. They would be pleased to receive catalogues, quotations, &c., pertaining to lines handled by Hardware merchants.

Silverman Bros., Altoona, Pa., who are dealers in Tin and Enameled Ware, Glass, notions, &c., would be glad to receive catalogues and price-lists pertaining to General Hardware.

S. J. Stebbins Company, Hardware and Stove merchants, with temporary quarters at 16 Custom House Place, Chicago, Ill., lost all their catalogues and price-lists in the fire which destroyed their store on the 13th inst. The firm will therefore be glad to receive copies of the latest printed matter issued by concerns making the line of goods in which they are interested.

The Enterprise Mfg. Company, Philadelphia, Pa., have issued a new catalogue of their patented Hardware place, Chicago, Ill., lost all their catalogues and price-variety of goods is shown, including Meat and Food Choppers, Measuring and Paint Faucets, Fruit, Wine and Jelly Presses, Sad Irons, Lawn Mowers and Sprinklers, Grinding Mills, Cherry Stoners, Raisin Seeders, Beef Shavers, Sausage Stuffers, Molasses Gates, Self Priming and Measuring Pumps, &c.

Flavin & Watson, who conduct at Mount Sidney, Va., a tinning, roofing, spouting and lightning rod business, and who sell Tinware, Pumps, &c., have opened a branch of their business at 15 North Augusta street, Staunton, Va., where they will carry on the same line of business, adding hot air furnace work and Cast and Steel Ranges. They will be glad to receive from manufacturers catalogues and price-lists of goods in these lines.

A letter from C. G. Delzell, Damascus, Ohio, informs us that he has leased quarters in the I. O. O. F. Building in that city for the purpose of enlarging his business and giving him facilities for handling his new lines, which are Stoves, Ranges, Tinware and Hardware. He will be glad to receive catalogues and price-lists from manufacturers and dealers in these goods.

An item in our last issue to the effect that the Lalance & Grosjean Mfg. Company of New York had installed representatives in two of the city stores to conduct demonstrations of their Agate Enameled Ware was incorrect. We are advised that these demonstrations were undertaken entirely on the part of the owners of the department stores referred to, and were not initiated by the manufacturers named. The company are making shipments of their Agate Enameled Ware to a number of foreign countries, including large orders for Tokyo, Japan, and Buenos Ayres.

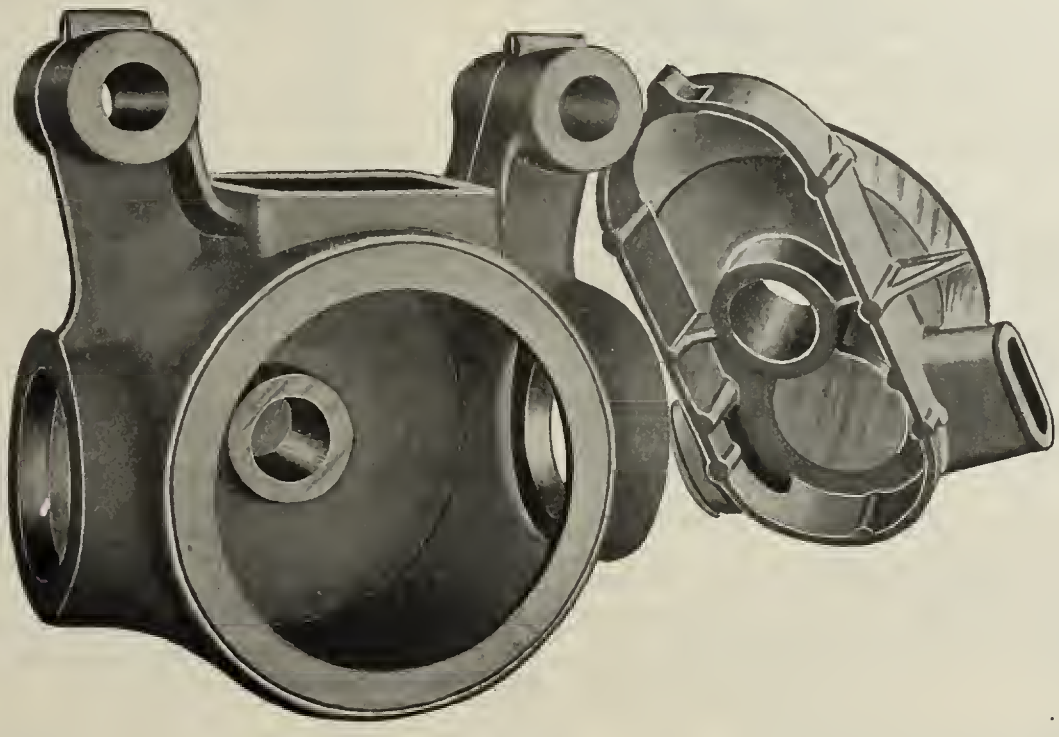
Black Silk Stove Polish Works, Lewis D. Wynn, proprietor, Sterling, Ill., have recently completed a new mixer and two automatic filling machines which have more than doubled their capacity. Trade during the first two months of 1902 is referred to as showing an increase of more than 100 per cent. as compared with last year. As to foreign trade, the concern advise us that they made their first shipment of goods to Brussels, Belgium, on the 14th ult. The different Polishes made by Mr. Wynn are being put up in new packages, which will present a much more attractive appearance than those heretofore used.

A Boston Trade Exposition.

The twenty-first triennal exhibition of the Massachusetts Charitable Mechanic Association will open in Mechanics' Building, Boston, on September 22 and close November 1, 1902. The managers of the association extend a cordial invitation to all mechanics and manufacturers having processes which can be shown, or wares which they desire to submit to the inspection of the people of New England, to contribute the same to this exhibition. It is the desire of the management to make this exhibition educational and valuable to the visitors, giving them an opportunity, under the most favorable conditions, to witness mechanical processes produced by the most skillful mechanics. The officers of the Massachusetts Charitable Mechanic Association, now in its one hundred and eighth year, consist of William N. Young, president; Edmund Hewins, vice-president; Newton Talbot, treasurer, and Alfred Bicknell, secretary.

A Difficult Aluminum Casting.

A large and difficult casting recently made by the U. S. Aluminum Castings Company of Cincinnati, Ohio, is here illustrated. It measures 15 x 18 x 11 inches, and is a crank case for a 16 horse-power double cylinder automobile engine. Castings of this description are hard to make, because of the size, the numerous openings and the tendency of the metal to shrink and draw.



A Difficult Aluminum Casting.

Utilizing Scrap Rubber.

The utilization of rubber scrap, says the *Electrical Review*, is of very great importance, for anything that can be added to new rubber to decrease its cost and increase supplies must be welcome, providing that the compound is serviceable. The scraps are sorted according to their composition, and then cleaned by boiling, which removes dirt and absorbs any adhering acids and free sulphur; but attempts to desulphurize vulcanized rubber have not been successful yet. The waste is ground between rollers and reduced to powder in emery grinders with automatic feeding, and in many cases the resultant material can be added at once to the new rubber mixture; but generally it is treated chemically by being boiled in a caustic soda solution or sulphuric or hydrochloric acid, and then steamed for about 24 hours at a pressure of four atmospheres. In another method, the ground scraps are steamed with soda lye under pressure, thoroughly washed twice to remove the lye, and then dried in vacuum. Then they are mixed between cold rollers with from 5 to 10 per cent. of benzol or mineral oil and steamed for several hours, at the same pressure as above. After either of these processes the product is rolled into plates and then added to the rubber dough.

The Molders' Wages.

There was a conference in New York City on Tuesday between representatives of the National Founders' Association and of the Iron Molders' Union of North America.

The National Founders' Association was represented by President W. D. Sargent, F. F. Towne, vice-president, of Stamford, Conn.; A. C. Pessano of the George V. Cresson Company of Philadelphia, R. D. Reed of the H. B. Smith Company of Westfield, Mass., and John A. Penton, secretary. The union was represented by Joseph F. Valentine, first vice-president, of Cincinnati, Ohio; M. J. Keough, second vice-president, of Troy, N. Y.; David Black, editor of the *Iron Molders' Journal;* William A. Perrine, business agent of the Iron Molders' Conference Board, New York, and James Flanigan of Elizabeth, N. J.

The conference was called to discuss demands made by the union as to wages and shop conditions and a demand for the nine-hour work day, ten hours being the present work day in the foundries. The question of wages and shop rules was discussed, and a joint committee was appointed to collect statistics from the various foundries as to rules and rates of wages. This committee will report at another conference on May 1.

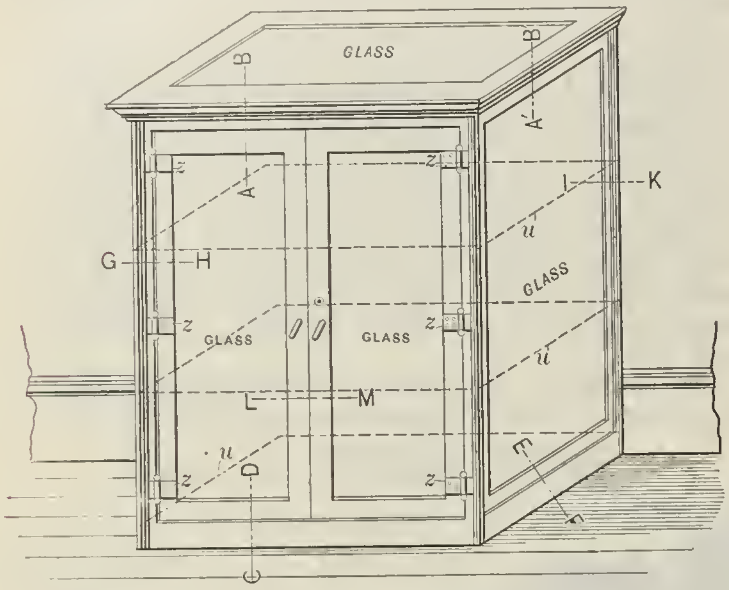
A series which should have been named "The Enchantments of Our Modern Aladdins," if considered solely from the point of view of romance, is begun in the May *Cosmopolitan*. But these sketches possess as well a business interest equally for clerk and capitalist, for manufacturer, farmer and merchant. The man who would understand the drift of our news in finance and business should read these lives, so full of incident, of chance, of hard labor and marvelous success. As it is the series receives only the commonplace name of "Captains of Industry." Each character is treated by a writer familiar with his subject.

The consolidation of a number of crane building interests under the name of the United States Crane Company is announced. The capital stock of the new company which will include firms located in New York, Cleveland, Muskegon, Mich., and other places, is placed at $100,000, which it is proposed ultimately to increase to $25,000,000.

A FIRE PROOF DOCUMENT CASE.

BY H. M. S.

In the preservation of papers and documents and other objects subject to public inspection in various institutions safety from fire is an important consideration. One of the recent improvements designed to afford greater protection is the replacing of the glass cases having wooden frames with cases having the framework made of sheet metal and for which sheet steel has many advantages.



A Fire Proof Document Case.—Fig. 1.—An Isometric View.

It is not generally known that hundreds of these glass cases are used as receptacles for china and valuable relics, which are on constant exhibition at such places as the Natural History rooms in New York and many similar places in all our cities. These relics are increasing in numbers as the years roll on, and as they are designed to be placed on exhibition for the general public, in such a manner as to be seen but not to be handled or touched, they are wisely locked within glass cases.

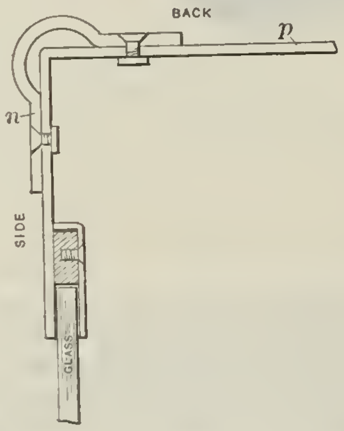


Fig. 2.—Back Corner Section.

Heretofore the frame work of these cases has been made of wood, but their rapid increase in numbers is awakening park commissioners, librarians and other public custodians to the necessity for the greater security and protection of these valuable relics and mementos, not alone from vandalism by placing them in glass cases to be seen and not handled, but by replacing the wood frame work with a material that shall be fire proof in construction. It was, partly at least, in view of this fact that the writer was recently asked to design a fire proof case of this character, with a view of its submission to the Park Commissioners of New York, where there was need for about 150 such cases in one of the park buildings.

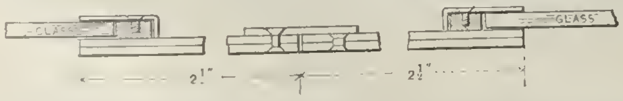

Fig. 3.—Section of Metal Door Frame.

As it opens up a phase of development of the sheet metal trade which, perhaps, is not altogether new, it may prove of interest to the readers of *The Metal Worker* to give a description of these metal cases.

An isometric view of the case is presented in Fig. 1, showing glass doors in front and glass ends and top.

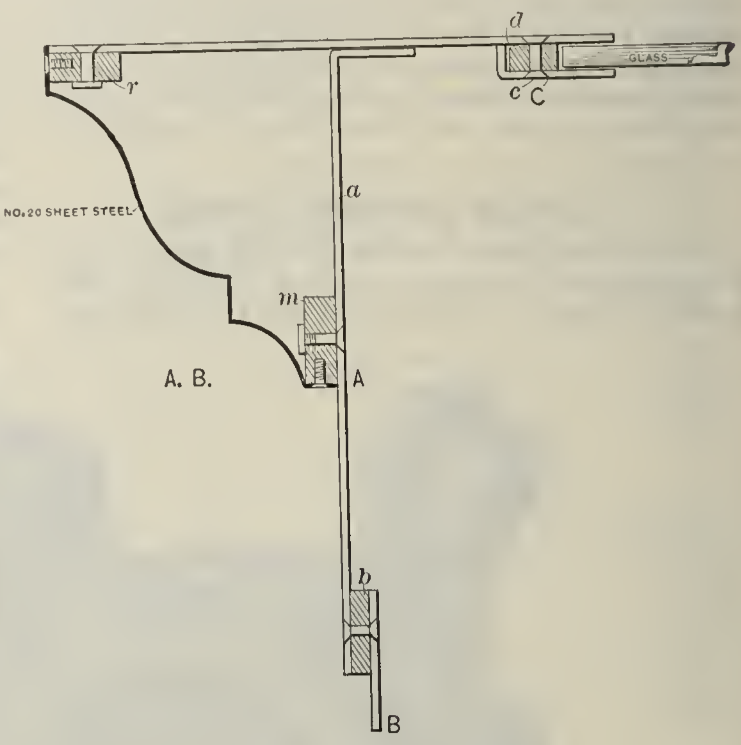

Fig. 4.—Front Top Section.

The size of the case is 6 feet wide, 8 feet high and 2 feet deep. Dotted lines, *u u u*, show the position of the shelves and *z z z z z z* show the position of the hinges for the doors. A section of the metal frame of the case is given in Fig. 2, at point I K in Fig. 1, in which *p* represents the back plate and *n* the corner bead. In like manner Fig. 3 shows a sectional view of the metal door frame at point L M in Fig. 1.

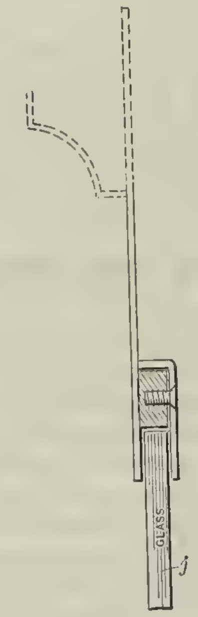

Fig. 5.—Section of End Below Crown Mold.

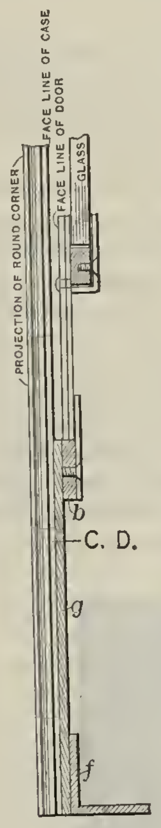
A section of the metal frame of the case at point A B in Fig. 1 is shown in Fig. 4. It will be noted that Fig. 4 shows a flat bar, ¼ x ½ inch, riveted to plate *a*, to which the bottom of the cornice is securely fastened. On the under side and at the front edge of the top plate is another ¼ x ½ inch flat bar, *r*, to which the top front of the cornice is fastened. At *d* another ¼ x ½ inch flat bar is riveted to the top plate, which, together with the sheet plate *c*, made out of No. 18 gauge sheet steel, forms a construction for holding the glass in position.



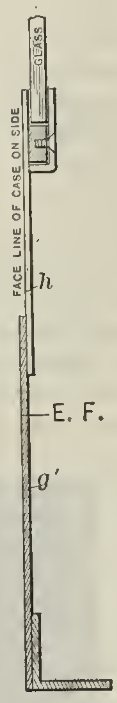


Fig. 6.—Section of Front Bottom. *Fig. 7.—Section of Side Bottom.*

The plate *c* is screwed onto the bar *d*, so as to be easily removed in case at any time the glass should crack or break, making it an easy matter to replace a broken glass.

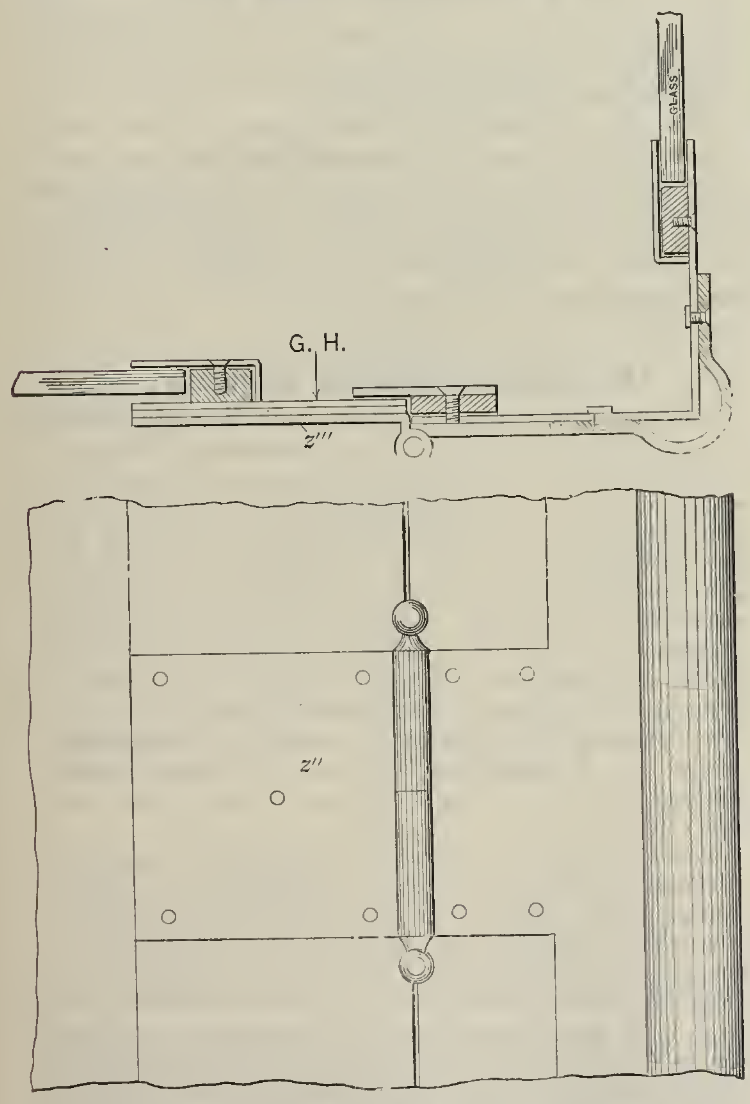

Fig. 8.—Section and Elevation Showing Corner Finish and Hinge.

All methods of holding the glass in position in the various parts of the case are of the same construction, as shown by bar *d* and plate *c*. The pattern for one is a pattern for all as regards size and form. At *b* a 3-16 x ¾ inch flat bar is placed in position between the two No. 16 steel plates, as shown, in order to give the desired recess for the reception of the door at the top and at the same time show a border of ⅛ inch outside the door when closed.

A sectional view of the metal finish on the two ends below the crown mold is given in Fig. 5, as shown from A′ to B′ in Fig. 1, and a section of the metal finish at the bottom of the case in front, as shown by C D in Fig. 1, is given in Fig. 6. The bar *b′* is ⅛ x ¾ inch, and *g* is the base plate, made of No. 10 sheet steel, with an angle iron, *f*, riveted on the inside at the bottom.

The base finish for the two ends is shown in Fig. 7, with the number of steel plate and the same size angle iron as in the front base shown by Fig. 6.

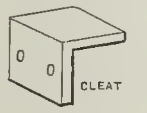

Fig. 9.—Shelf Support Cleat.

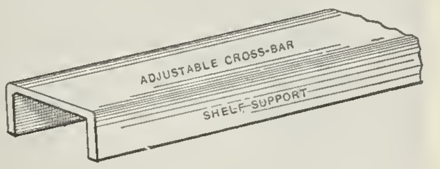

Fig. 10.—Shelf Support Bar.

The sectional view, Fig. 8, shows the frame construction at G H in Fig. 1, with extra heavy bead extending from the crown mold to the floor. In the elevation given in Fig. 8 *z″* shows the face of the hinge, and *z‴* in the sectional view its form and thickness. The cleat shown in Fig. 9 is riveted to the front and back of case at each side, and upon which the cross bar, as shown in Fig. 10, rests to hold the shelves.

A sectional view of shelf and its support is given in Fig. 11. The cleat being the only part of the shelf support that is fastened to the case, the cross bars and shelves can be easily adjusted and taken out when desired. The frames for the doors are made of two thicknesses of sheet steel, No. 10 and No. 16, the No. 10 steel being put on the outside.

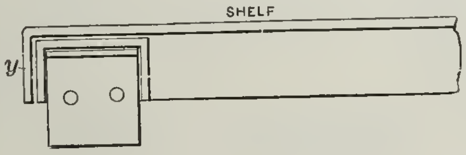

Fig. 11.—Section of Shelf, Support and Cleat.

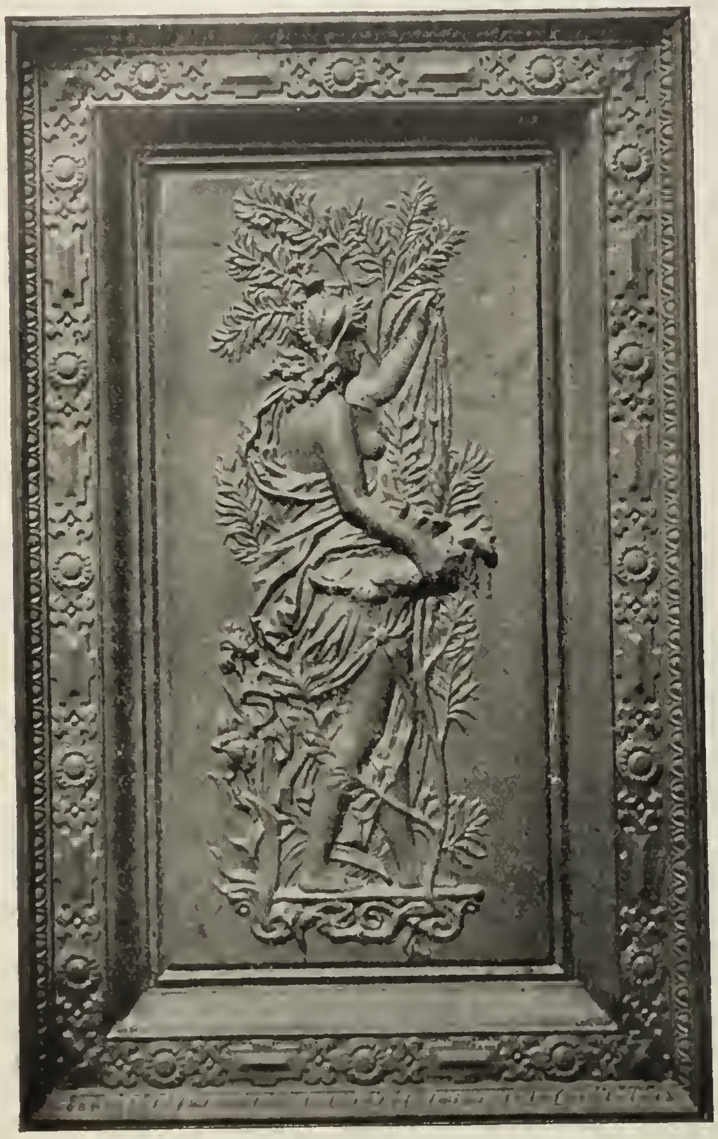
A New Metal Ceiling Catalogue.

W. J. Burton & Co., Detroit, Mich., are distributing their new catalogue "N," covering the line of metal ceilings and side walls, which they are offering in a much larger variety of designs than heretofore. The catalogue is a 112-page publication, 10 x 13½ inches in size, profusely illustrated with excellent half-tone engravings. At the beginning a brief introduction dwells upon the merits of steel ceilings and side walls as a modern substitute for wood and plaster, their durability, fire, water and dust proof and sanitary qualities, combined with their architectural beauty, being cited among the recommendations of this class of goods. Full instructions are given for ordering ceilings, together with directions for applying the same. Among the goods shown are many handsome designs in Romanesque, German Renaissance, Rococo, Colonial, Empire and Gothic styles. The illustrations show ceiling and side wall panels, borders, friezes, moldings, cornice, cornice blocks, wainscoting plates, &c. Some full page views are presented of buildings and halls covered with the company's sheet metal ceilings and side walls. Accompanying the catalogue is a price-list, dated April 11, 1902, covering all the goods shown in the larger publication.

ONE of the new Sheet mills at the Laughlin Nail Company's plant, at Martin's Ferry, Ohio, was started up this week. A second mill will be ready for operation next week.

Decorative Art Metal Plates.

The Penn Metal Ceiling & Roofing Company, Limited, of Hamilton and Twenty-third streets, Philadelphia, Pa., and 14 Harcourt street, Boston, Mass., have just issued an exceptionally handsome catalogue of 172 pages covering their long line of Sagendorph's patent metal sectional ceiling and side wall decorations, suitable for churches, halls, hospitals, asylums, schools, theaters, stores and dwellings of all classes. The present is the twenty-eighth catalogue issued by the firm, each one being more elaborate than its predecessor. It is of a size, 10 x 14 inches, sufficient to effectively show large half-tones of ceilings and side walls in place in a variety of rooms, halls, stores, &c., giving an excellent idea of the decorative possibilities of these materials. The company state in the preface that it is their preference to put up their ceilings in Philadelphia, New York, Boston and vicinity, although they are prepared to furnish competent mechanics and artists to put up their work in any section of the United States when desired.



Decorative Art Metal Plates.—Fig. 1.—Bas Relief Plate. Nymph.

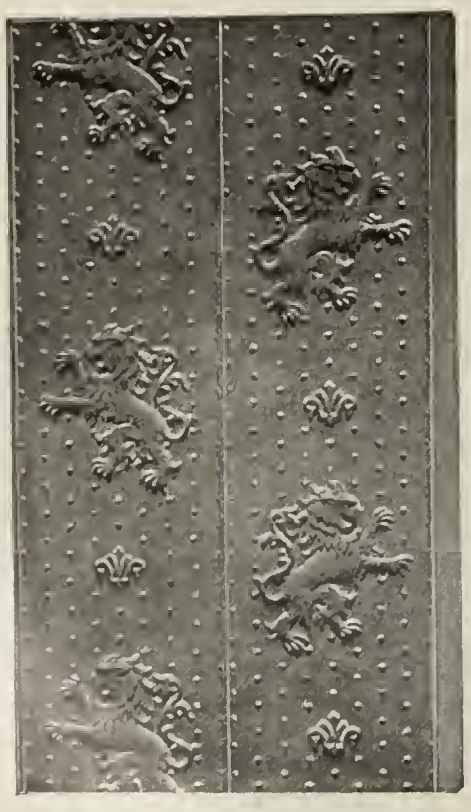


Fig. 2.—Gothic Side Wall Decoration.

At the beginning of the book detailed instructions are given for putting up the steel ceilings and side walls, as well as directions for decorating them, accompanied by diagrams showing the method of application. An immense number of fine half-tone illustrations show the great variety of handsome patterns turned out by the concern, including continuous ceiling or side wall plates, shallow and deep ceiling plates, ceilings and borders in German Renaissance, Empire, Rococo, Colonial, Italian Renaissance and Elizabethan styles, together with borders, friezes, center pieces, wainscoting, coves, moldings, drop blocks. bottom pieces, bases, cornices, brackets, zinc stamped ornaments, ventilating centers and Dado plates. One section of the catalogue is devoted to special *bas relief* plates and frames, many of which are of an exceedingly elaborate character.

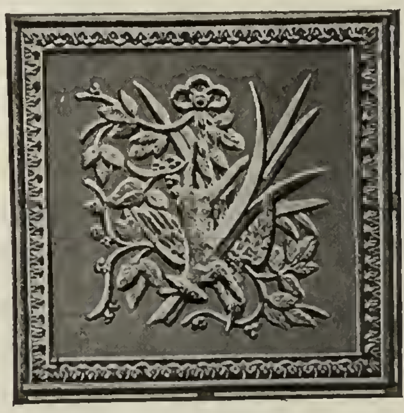

Fig. 3.—Ceiling Plate for Dining Room.

We present herewith a few examples of the company's decorative art metal work. Fig. 1 is a *bas relief* plate representing a nymph, specially designed for the decoration of large halls, hotels, or public buildings. Fig. 2 gives an example of the company's Gothic side wall decoration, and Fig. 3 is shown a specimen of one of their ceiling plates for dining rooms.

The Vulcan Detinning Company.

Announcement is made of the acquisition by a syndicate of the Vulcan Metal Refining Company of Sewaren, N. J., and the Vulcan Western Company of Streetor, Ill., which concerns are engaged in the recovery of tin plate scrap and its conversion into steel scrap and pig tin. The syndicate which has been formed by G. Sidenberg & Kraus, bankers of New York City, will form a new corporation under the name of the Vulcan Detinning Company, under the laws of New Jersey, with a paid up capital of $3,500,000. They will operate the plants at Sewaren and Streator. The Board of Directors of the new company will consist of Samuel R. Beardsley, Joseph B. Bloomingdale, Lyman G. Bloomingdale, Stephen A. Ginna, Meyer Hecht, Adolph Kern and Harry Kraus.

The Vulcan Metal Refining Company were organized in October, 1898, with a capital of $180,000 to utilize a process for the reduction of scrap tin plate that had been successfully employed in similar works in Germany. The process, while covered by patents, of which the American rights were acquired by the Vulcan Company, is in part a secret one. It is electrolytic and similar, in a general way, to the process used for separating copper and other metals. The Sewaren works has a capacity to handle 10,000 tons of scrap a year. A year later, in 1899, a similar reduction plant was erected at Streator, Ill., by the same interests, and a company were incorporated with a capital of $300,000, under the name of the Vulcan Western Company. Both plants have since been operated with entire success.

The American Can Company.

The balance sheet of the American Can Company of Jersey City as of March 31 shows:

Assets.

Plant, real estate, patents, &c.		$75,256,379
Improvements		366,869
Other investment items		1,009,439
Cash		1,075,789
Bills and accounts receivable		1,487,024
Merchandise inventoried at cost		5,841,885
Total		$85,037,385

Liabilities.

Preferred stock	$41,233,300	
Common stock	41,233,300	
		$82,466,600
Mortgages assumed		119,000
Accounts payable		676,221
Surplus		1,775,564
Total		$85,037,385

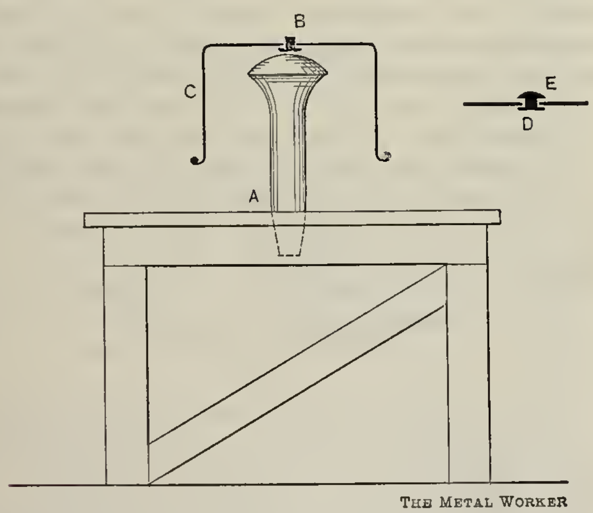
At the stockholders' meeting the following directors were nominated for five years: Warner M. Leeds, George G. McMurtry, L. H. Landon and W. F. Dutton. Vice-President Akin in his report for the year says: "The company have suffered during the past year from the general shortage of crops and particularly from the shortage of the fruit crop. In spite of these unfavorable conditions the company have not only held their trade, but have even increased the volume of business. The contracts and orders now on hand indicate a much larger business than for the past year. The great problem before the company is the concentration of their plants. Much of this has already been done. When these changes have all been made the company can operate at a much less cost than now. The treasurer's report shows the inventory of merchandise at cost, which is conservative. The cost of dismantling plants has been charged direct to the operating expenses." The officers elected at the meeting of the Board of Directors are as follows: President, F. A. Assmann; first vice-president and chairman of the Executive Committee, H. F. Akin; second vice-president, T. G. Cranwell; secretary and assistant treasurer, L. H. Landon; treasurer and auditor, F. S. Wheeler; assistant secretary, W. F. Dutton; second assistant treasurer, R. A. Burger.

HINTS FOR THE TIN SHOP.

The following three hints may prove of some value to the tinsmith who runs a general jobbing shop:

REPAIRING ENAMELED WARE.

In Fig. 1 is shown the method of repairing enameled ware. A leak in this ware is difficult to solder. It may be repaired, however, by opening the leak hole with a small reamer to the size of a 1-pound soft tinned rivet. Then place a rivet, B, on the round headed stake A, and put the vessel C over the rivet where required. The rivet should then be spread with the hammer, as shown by D, setting it down well with the rivet set, as at E. If a soft rivet is used the opening in the vessel will become perfectly tight without any soldering.



Hints for the Tin Shop.—Fig. 1.—Repairing Enameled Ware.

A SOLDERING TROUGH.

In Fig. 2 is shown a wooden trough used for soldering leaders or pipes. This trough is made of ¾ x 6 inch stuff, 10 feet long, with standards fastened or nailed to the bottom, as shown by A, B and C. It is used as follows: When the pipes are all grooved or riveted together in 24, 30 or 36 inch long joints, one end of each joint is crimped, and the joints put together in one length of 10 feet. The joints are first tacked with solder on both sides, then the trough is raised a little higher on one end to allow the solder to flow when soldering. In diagram D is shown the leader E in position.

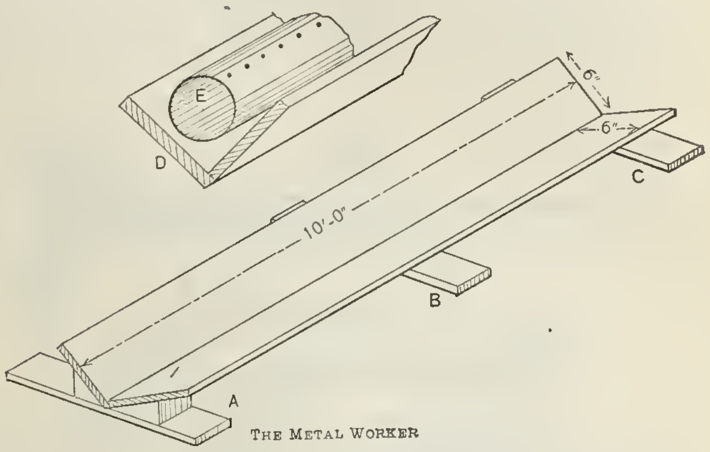


Fig. 2.—Trough for Soldering Leaders or Pipes.

FIRE POTS.

No doubt many tinners have experienced trouble while working on new jobs by having hot coals fall out of their fire pot when taking out a soldering copper. This is very apt to occur in the ordinary fire pot shown in Fig. 3, where, as above mentioned, when taking the coppers out at A hot coals fall onto the wood sheathing, and if no precaution is taken on a windy day are apt to cause some expensive damage. This can be avoided by putting a safety pan under the soldering copper support C in Fig. 4, as shown by A, with a ledge bent around the three sides, as shown by B. Then if any hot coals should fall out they will be caught in the pan A and much danger and trouble avoided.

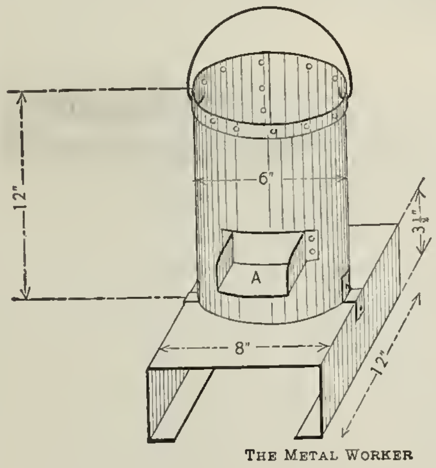

Fig. 3.—The Ordinary Fire Pot.

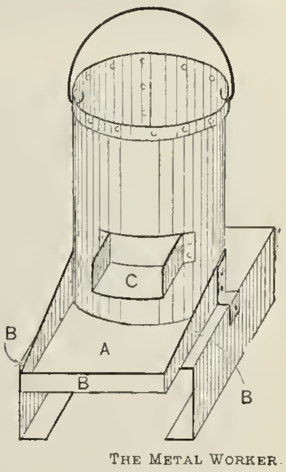

Fig. 4.—Pot with Safety Pan.

Amalgamated Association Wage Committees.

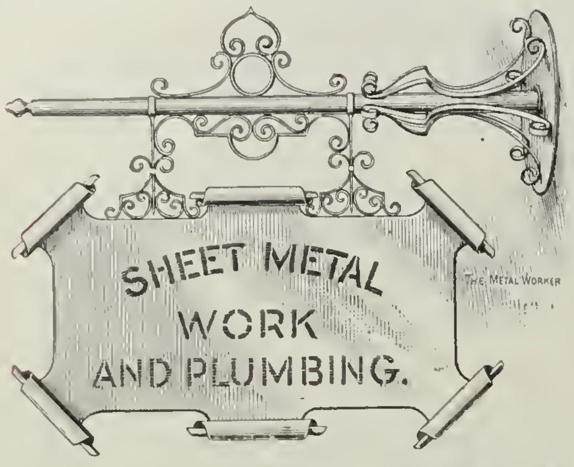
The following Wage Committees of the Amalgamated Association of Iron, Steel and Tin Workers were appointed last week by President Shaffer, at the convention of the association, at Wheeling, W. Va.:

Tin Plate: John Chappell, James Sadler, New Castle, Pa.; W. G. Price, New Kensington, Pa.; Walter Larkin, T. J. Davies, Martins Ferry, Ohio; Clem Jarvis, Anderson, Ind.; John Quinn, Granite City, Ill.; Wm. O'Brien, Elmwood, Ind.; Chas. Williams, Waynesburg, Pa.; W. H. Evans, Jr., Middletown, Ind.; John Owens, New Castle, Pa.

Sheet: John Ridd, Newport, Ky.; John G. Hagan, Piqua, Ohio; Otto Sellers. Muncie, Ind.; Charles James, H. J. Cecil, Martins Ferry, Ohio; Thomas Fox, Wheeling, W. Va.; H. J. Carson, Canton, Ohio; George W. Davis, Cambridge, Ohio.

MAKING SCROLL SIGNS.

In working out sheet metal signs, as is shown in Fig. 1, a neat effect is obtained by placing scrolls at the top, bottom and corners. The scroll must be laid out in the flat correctly so that, when rolled up, it will have the proper appearance. In Fig. 2 is shown how this can be accomplished. Let A B C D represent the flat surface of one corner of the sign on which a scroll is desired, as shown in Fig. 1. In practice, the section is first laid out, from which the elevation is projected as follows: In its proper position draw the desired section of the scroll, as shown by the small figures 1 to 12 in the elevation in Fig. 2. Directly in line with the elevation draw a duplicate of A B C D, as shown by A^1 B^1 C^1 D^1. Now divide the section of the scroll into any number of desired spaces, as shown from 1 to 12, the spaces from points 8 to 12 being smaller, because the curve is also smaller. At right angles to A^1 B^1 draw the line F G, upon which, starting from the line A^1 B^1, place the stretchout of the scroll, as shown from points 1′ to 12′. At right angles to F G draw the line 12′ I and 12′ H, equal to the desired width at the end of the scroll. Then from I and H draw free hand curves to B^1 and A^1 respectively, as shown. Then will H I B^1 A^1 be the pattern for the corner scroll.



Making Scroll Signs.—Fig. 1.—A Finished Sign.

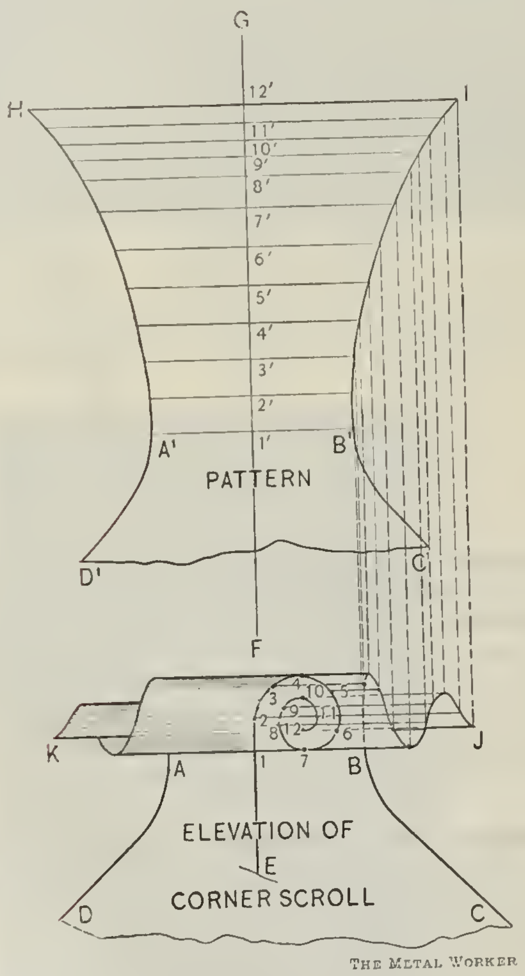


Fig. 2.—Elevation and Pattern.

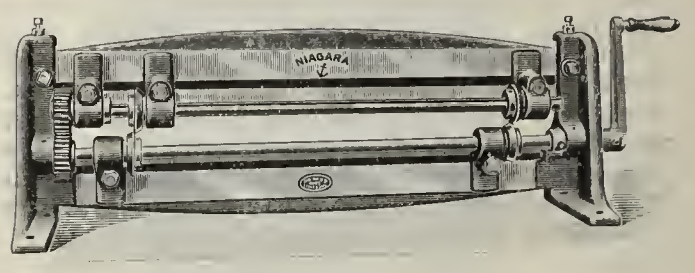
If it is desired to know how this scroll will look when rolled up, then, at right angles to F G and through the intersections 1′ to 12′, draw lines intersecting the curves I B^1 and A^1 H. From these intersections, shown on one side only, drop lines intersecting similar numbered lines drawn from the intersections in the profile of the scroll in elevation parallel to A B. Trace a line through the points thus obtained, as shown by B J and A K, which gives the projections at the ends of the scroll when rolled up.

Duplex Rotary Slitting Shears.

In the accompanying illustration is shown the new Duplex rotary slitting shears, manufactured by the Niagara Machine & Tool Works, Buffalo, N. Y. This machine is intended for cutting apart sheets of any length, of No. 24 gauge and lighter and up to 30 inches wide. The cutters are carried by holders that are fastened to the upper and lower part of the frame, independent of the shafts. The distance between the cutters can be adjusted from 3½ to 30½ inches. The machine will answer for trimming sheets up to 30 inches wide, or for dividing a sheet into two or three strips. The cross head for carrying the upper cutters can be lowered to permit of taking up wear on the cutters. This machine is intended to be sunk into a bench with the upper surface of the lower cutter flush with the surface of the bench. At right angles to the machine gauges can be provided according to the work in hand.



Duplex Rotary Slitting Shears.

FLASHINGS.

A SIXTH MILL has been added to the Carnahan Tin Plate & Sheet Company's plant, at Canton, Ohio. About 400 men are now employed in the various departments of the Carnahan plant, and the number will be increased before long to 600.

GEORGE C. KEENE & Co. of Cincinnati, Ohio, manufacturers of Sheet Metal Working Machinery, who have been for many years located in what is known as the "Bottoms" district of the city, have been compelled, owing to their rapidly increasing business, to seek larger quarters; and have secured a piece of ground adjoining the old power house of the Walnut Hills cable road, upon which they will at once begin the erection of a new plant, 80 x 70 x 88 feet, part one story and part two stories. The new building will be provided with the latest and most improved machines and equipment, including traveling cranes, &c. A gas engine will supply power for the machinery. The new works will be completed within 90 days.

Two more Sheet mills are to be added to the Falcon plant of the American Sheet Steel Company, at Niles, Ohio.

IN a recent number of *Finance* of Cleveland, Ohio, is presented a full description, with illustrations, of the large plant of the Berger Mfg. Company, at Canton, Ohio, together with a history of the concern showing their remarkable growth, since their establishment in a modest way in 1886, until the attainment of their present position as one of the leading industrial enterprises of Canton.

THE UNITED STATES COLD ROLLED STEEL & MFG. COMPANY, with principal office at 800 Broad street, Newark, N. J., have been incorporated with a capital of $100,000 by Theo. Wagner, Geo. G. Aeschbach and Otto Aeschbach. The object of the company is the rolling of Metals.

The American Tin Plate Company have placed an order with the Bass Foundry & Machine Company of Fort Wayne, Ind., for the installation of a 2500 horsepower Corliss engine at their plant at Elwood, Ind. The engine will have a fly wheel weighing nearly 70 tons.

The American Tin Plate Company have obtained a temporary injunction in the United States Court at Covington, Ky., against the Licking Rolling Mill Company of that city, restraining them from using the letters "M. F. H." on certain brands of Tin Roofing. The plaintiff claimed that the use of these letter constituted an infringement upon their property rights. The case will come up for argument at the next term of court.

F. H. Dawson, Williamson, W. Va., is desirous of learning the present whereabouts of F. M. Duley, a tinner and cornice maker.

The third annual meeting, election of officers and banquet of the Master Tin Roofers' and Metal Workers' Association of Troy, N. Y., will be held on Wednesday evening, May 7, at 273 River street, Troy. The committee in charge, consisting of David White, chairman; Leo Rivers, James M. McCoubrey, Harry Packard and F. T. Ham, have made arrangements which promise that this will be one of the most enjoyable affairs the association has yet had. It is hoped and expected that every member will be present. James Hamil is president of the association and Fred. T. Ham the secretary.

The business with South Africa has been picking up. During the first three months of the current year 16,000 tons of Galvanized Sheets were exported from Great Britain, against 4000 tons during the corresponding period of last year.

Some extensive improvements are to be made at the Old Meadow works of the American Sheet Steel Company at Scottdale, Pa. The improvements consist in labor saving devices and an increased output. Electric power is to be introduced in many of the departments where steam has been used, and the plant is to be modernized.

The citizens of Worthington, Ind., are actively at work planning to secure new manufacturing enterprises. They have in view a Tin Plate and Sheet Steel plant, the projectors of which are seeking a location. A fund is being raised for the payment of bonuses on this and other projects.

The Lalance & Grosjean Mfg. Company of New York City are sending to their customers a pair of pictures neatly framed in black wood, giving views of their rolling mills at Harrisburg, Pa., and their large factory at Woodhaven, L. I. These pictures convey a good idea of the magnitude of the plants owned and operated by the company.

The Conklin Tin Plate & Metal Company of Atlanta, Ga., have been incorporated with a capital stock of $60,000 by J. T. Pendleton, Charles A. Conklin and John N. Goddard.

The Southern Roofing Company of Louisville, Ky., have been incorporated with a capital stock of $1500 by C. A. Monks, C. H. Carter and John C. Zulauf.

Trade School of the Massachusetts Charitable Mechanic Association.

The trade school established in October, 1900, by the Executive Committee of the Massachusetts Charitable Mechanic Association has just completed its second term. The school opened on October 14, 1901, and closed on April 11, 1902. During that time classes were held in bricklaying, plumbing and carpentry, on every Monday, Wednesday and Friday evening of the week, from 7.30 to 9.30 o'clock. We are advised by Secretary Alfred Bicknell that the classes in bricklaying and plumbing were fully attended, but the class in carpentry did not secure a full list of pupils. Many of the plumbing class were already plumbers' helpers. A number of the pupils have been graduated, receiving diplomas of competence after proper examination. The good progress made by the students during the term gives the committee the assurance that in a school of this kind a young man in good health, with perseverance, determination and good personal habits, can become possessed of a competent working knowledge of a trade.

Pupils who desire to enter must be over 16 years old, and must bring recommendation of their being of good habits and behavior. No one is admitted except for the full term. The tuition fee is $15, of which $8 must be paid in advance, and the balance on January 1. Blank forms for admission will be sent on application to Alfred Bicknell, secretary, Mechanics' Building, 111 Huntington street, Boston, Mass. The Executive Committee contemplate the gradual addition to the school of certain other trades until they have a full course of instruction in all the building trades, with possibly some others. The charge for tuition brings in about half of the cost of light, heat, materials and instructors.

The Waggoner Watchman Clock.

An improved electric clock for the purpose of recording the visit of a watchman to the different parts of the premises is manufactured by the Waggoner Watchman Clock Company, Grand Rapids, Mich. This clock has been on the market for a comparatively short time, but a large number are now in use. It has a unique method of registration. It prints the record on the back of the dial by means of a vibrator actuated by an electric current. Ordinary push buttons are used to make the contact, thus avoiding the use of keys, which may be lost or tampered with. The registration is entirely secret, the vibrators printing on the back of the dial by means of a typewriter ribbon. The time of the registration can be clearly seen when the dial is held to the light. The dial cannot be stopped through any manipulation of the wires or push buttons, and if the clock is short circuited a black line is printed on the back of the dial, showing the time and at what station the wires were tampered with.

The secret registration on the back of the dial is claimed to be a positive protection against the manipulation of the clock, for the reason that the arrangement of the stations cannot be ascertained except by reading the dial after its removal. Further than this, the arrangement of the stations can be easily altered by shifting the connections of the various vibrators should such a change be desired for any reason. Should an attempt be made to open the door of the clock with a duplicate key, a knife arrangement in the top of the clock cuts the edge of the dial and shows that the clock has been opened by some unauthorized person. The clock door may even be left unlocked, as the fact of this being opened will be shown on the dial. While the dials used are special, as regards the quality of the paper, any dial of the proper size and quality may be used. They are simple in design, and one can be ruled up with a lead pencil, if necessary, or in case of the shortage of dials one could stay on the clock a week and the watchman not know it.

An addition to the service of a clock of this kind is in the alarm adjustment which is furnished only in the Waggoner clock. If the watchman does not register within ten minutes of the time for starting his rounds an auxiliary connection moving with the dial closes the circuit and rings a gong in the building to be watched, at the same time sounding an alarm in the house of an official residing near the factory or building. The alarm will ring until the clock is registered. This attachment is entirely automatic. Another feature which can be added to the protective service of the clock is a fire alarm to be operated by thermostats placed at any desired point about the buildings. The alarm being sounded gives the watchman prompt notice of a fire. These clocks are made in three regular sizes, No. 1 being intended for four stations or less, No. 2 up to ten stations and No. 3 up to 14 stations.

According to the Treasury Department report the amount of money in circulation in the United States on April 1 was $2,252,047,357, making a per capita circulation of $28.59 for each man, woman and child in the country.

DEATH OF B. FRANK HOOPER.

The death of B. Frank Hooper, president of the Colwell Lead Company of 63 Centre street, New York, which occurred suddenly at 11 o'clock on Sunday evening, April 20, was a severe shock to his many friends and business associates in and outside of the plumbing supply trade. He was one of the best known and best liked men in the business and, owing to the various interests with which he was connected, was acquainted with the members of the plumbing supply trade all over the United States and Canada.

Mr. Hooper's death was entirely unexpected. He had been ailing for some time past, and had suffered considerably with an affection of his left foot, but his illness was not of sufficient importance at any time to keep him away from his office, or from transacting business on behalf of the various associations with which he was connected.

B. FRANK HOOPER.

On Friday of last week he attended several important meetings, and was at his office until 6 p.m. On Saturday morning he was indisposed, and did not go to his office, but, acting on the advice of his physician, he went driving in the afternoon. On Sunday afternoon he had been out walking, and was, apparently, in very good health. That night he felt sufficiently well to dine with an aunt, who he was anxious to see before his departure for Europe, returning to his home about 9 o'clock. About 10 o'clock he complained of feeling unwell, and told his wife that something he had eaten had disagreed with him. After preparing himself to retire, during which time he had a severe fit of coughing, which left him very weak, he sat upon the side of his bed, His wife, thinking he needed help, went to him and placed her arms about his shoulders. She spoke to him, only to receive no answer. Immediately divining that something must be wrong with him, she felt his pulse to find that life was extinct. Thus passed away one of the best known and most highly esteemed representatives of the business interests of New York City.

Benjamin Franklin Hooper was born in New York City on June 30, 1857. He was a son of John and Angelina H. Hooper. His father, who preceded him as president of the Colwell Lead Company, and who died in 1889, was an old stockholder of the New York *Tribune* and a business associate of Horace Greeley. He attended West Point in the class with Jackson and Beauregard. Later he held office in several important corporations, and was a member of the New York Board of Education and founder of the North River Savings Bank of New York. Upon his death he presented two fountains to the city, and bequeathed $150,000 to various charities. His paternal grandmother was a daughter of John Horton, in whose house General Putnam slept just previous to being chased by the Hessians, from whom he escaped by making his famous leap.

B. Frank Hooper received his early education in New York private schools, where he was fitted for college, and in 1878 was graduated from the College of the City of New York with high honors. In September of the same year he entered the Colwell Lead Company, of which his father was the president, and steadily advanced in position until, in 1889, upon the death of his father, he was elected president. This office he held until the time of his death. Mr. Hooper was also president of the Independent Foundry Company of Port Chester, N. Y.; president of the Manufacturers' and Dealers' Protective Association; vice-president of the Association of Manufacturers and Jobbers of Plumbers' Supplies, and treasurer of the National Committee of the Confederated Supply Associations, and also held the leading interest in the American Sanitary Company of Elizabeth, N. J. He was a member of the Colonial, Hardware, Fulton, New York Athletic and City College clubs, the Chamber of Commerce, the New England Society, St. John's Lodge, F. & A. M., and the American Yacht, Larchmont Yacht, West Side Republican and National Arts clubs, besides being upon various Advisory and Executive committees in the different associations with which he was connected. He was a director of the Central Park Improvement Company.

In 1888 Mr. Hooper married Edith May, daughter of Alva S. Walker, who is vice-president of the Colwell Lead Company, and proprietor of the Hotel Beresford, New York City. Mr. Hooper leaves a widow and four children, Stanley, Walker, Emily May and Grace Duncan.

The funeral service was held in the Church of the Divine Paternity, Seventy-sixth street and Central Park West, on Wednesday evening. The Rev. Dr. Clark of Boston, Mass., who officiated when Mr. and Mrs. Hooper were married 14 years ago, delivered the eulogy and pronounced the benediction. Handsome floral pieces were sent by the National Committee of the Confederated Supply Associations, the Association of Manufacturers and Jobbers of the United States, the officers and employees of the Colwell Lead Company and of the Independent Foundry Company, George L. Knox, Francis J. Torrance and many others.

Among those in the trade who were present at the services were Carleton W. Nason and Frank A. Bucknam of the Nason Mfg. Company; Frank Knox of Hartford, Conn.; Mr. Bampton of the Chadwick-Boston Lead Company, Boston, Mass.; Wm. B. Maddock of John Maddock & Sons, Trenton, N. J.; G. C. Ainslee of Chambers & Ainslee, Newark, N. J.; John H. Meuller of Port Chester, N. Y.; Wm. Trageser of the John Trageser Steam Copper Works, Martin D. Fink and Otis K. Dimock of Dimock & Fink Company, Erastus E. Haff and Mr. Blauvelt of the F. N. Du Bois Company, Clarence H. Rose, Henry Stein, Fred D. Hussey of W. H. Hussey & Son, H. P. Read and Clifton Driggs of the H. P. Read Lead Works, John A. Murray, Wm. Murray, Harry M. Smith of C. S. Locke & Smith, William McShane, Thomas G. Knight, Rudolph Eggelstrom, R. E. Carey, James F. Conran of the Standard Sanitary Mfg. Company, Chas. W. Woodward of the National Committee of the Confederated Supply Associations, Leffert Lefferts, Louis F. Merlan of Mayor, Lane & Co., John A. Lefferts of the American Sanitary Company, W. E. Campbell of the Campbell Supply Company, Thomas Leahy and

Frank Reynolds of M. Reynolds Plumbing Supply Company, Wm. Naylor, W. R. Campbell, Robert H. Hoile, Daniel L. Daub, Oscar A. Knapp, John J. Carroll, R. McWilliams, C. C. Tracy, Wm. Tracy, Frank P. Richardson, A. M. Drake and upward of 50 other employees of the Colwell Lead Company. The interment was made on Thursday morning in the family plot in Greenwood Cemetery, Brooklyn, the services at the grave being of a Masonic character.

Gorton Boilers in the Yale Club Building.

Architects, heating engineers and others will be interested in the heating plant of the Yale Club Building, 30-32 West Forty-fourth street, New York City. Aside from the very satisfactory results that have been obtained since its installation something over a year ago, the equipment is of interest from the fact that steam is furnished to cook with in the club kitchen as well as to heat the large 11-story building, the temperature of which has been maintained at 70 degrees, even during the severely cold days of the past winter. The boiler room is situated below the sidewalk and is equipped with a battery of three Gorton side feed steam boilers of the latest pattern, manufactured by the Gorton & Lidgerwood Company of New York City, consisting of one No. 36 and two No. 38 boilers.

The building is an imposing structure and of the highest class of construction throughout. Tracy & Swartwout of New York City are the architects. It is heated by two-pipe system, which was put in by Baker, Smith & Co. of New York City, after plans of A. R. Wolff, consulting engineer. The two No. 38 boilers have been found more than sufficient for heating the building. Steam will circulate under 3 pounds pressure, and only on the coldest nights has it been necessary to carry more than this.

The boilers furnish steam for 168 radiators and 18 coils, aggregating 5470 square feet of radiating surface, distributed throughout the 11 stories, including basement and roof. Two tanks, holding together about 10,000 gallons of water, used for various purposes throughout the building, are kept from freezing by steam from the heating boilers, which is supplied to coils suspended along one side of the room under the roof in which the tanks are located.

The kitchen, which is on the top floor, is supplied with steam for the cooking kettles from the No. 36 boiler, carrying about 40 pounds. This boiler is licensed to carry 75 pounds, being tested up to 125 pounds water pressure by the Fidelity & Casualty Company. Steam is also furnished by this boiler to the pantry for warming dishes, making coffee, &c., and keeping soups and various other foods warm. The experience with the system for nearly two years in which it has been in use has been highly satisfactory.

The engineer in charge of the plant reports the Gorton side feed boilers as very economical and exceptionally rapid steamers. Even on the coldest days no difficulty has been experienced in getting steam up to 40 pounds in 17 minutes, and it has only been necessary to coal up twice in 24 hours. Ease of management is a noticeable characteristic of the Gorton boilers. They require very little attention. When it is considered that the engineer in charge of the three boilers at the Yale Club has also to care for the entire electrical plant and other power equipment of the building, as well as the plumbing, it will be seen that but little time can, of necessity, be given to attending the heating plant.

To sum up, the experience of nearly two years has shown that the system of heating employed at the Yale Club Building is very economical in the use of fuel, extremely easy to care for and most satisfactory in every way in results obtained. It is suggested as a most satisfactory equipment for hotels, club houses and restaurants where cooking by steam is desirable in connection with the usual heating of the premises. We are advised that a number of Gorton side feed boilers have been used for such purposes with entire satisfaction.

T. P. Frantz will receive bids until May 1 for a steam heating plant for St. John's Reformed Church, at Lebanon, Pa.

AN INTERESTING INCIDENT IN THE PITTSBURGH PLUMBING TRADE.

Commendable efforts to prevent their trade from suffering the evil of competition endured by the grocers and some other tradesmen are being earnestly made by the master plumbers in different sections, and various plans have been devised for perfecting the excellent protection which this trade now enjoys. It is not surprising that all the methods adopted fail to meet the approval of their supply brethren, but if honest effort is made to reach an agreement that will be at least practicable and equally beneficial to all interests the spirit of the effort will prevail, even should the details be radically changed.

There are certain lines within which all trade agreements must be kept if the provisions of the statutes for the public protection are to be avoided, and both parties to an agreement must take cognizance of this before a lasting arrangement can be effected. The character of some of the papers prepared by master plumbers for the consideration of the supply trade is reflected in the correspondence recently exchanged in the Pittsburgh trade. Under date of April 9 the Master Plumbers' Association of Pittsburgh, Pa., sent the following letter to the supply trade:

Gentlemen: Your attention is respectfully called to the following resolutions:

Resolved, That all names appearing on the official list presented by the Master Plumbers' Association are the only ones recognized as regularly engaged in the plumbing business.

Resolved, That in the event of any person or persons, firm or corporation desiring to purchase goods or engage in the plumbing business from a jobber or supply dealer, that the secretary of the Master Plumbers' Association be notified, and that an answer be furnished to the said jobber or supply dealer within one week from the day of notification, whether said person or persons, firm or corporation be added to the official list, a notification to be sent at the same time to the secretary of the Pittsburgh Credit Bureau.

Resolved, That the Master Plumbers' Association reserve the right to revise the official list as circumstances may warrant.

After giving due consideration to the resolutions the manufacturers and supply houses were a unit in their opposition to a favorable consideration, and instructed their secretary to send the following letter:

Secretary of the Master Plumbers' Association.

Dear Sir: Answering yours of the 9th instant, I am authorized by the members of the Pittsburgh Credit Bureau to notify you that we will not be governed by your resolutions, as we are now working under the Chicago Resolutions, a copy of which is herewith inclosed.

This correspondence was completed previous to the annual convention of the Pennsylvania Master Plumbers' Association, which expressed by vote approval of the Cleveland Resolutions.

The National Supply Company.

The National Supply Company, Baltimore, Md., have recently added a brass goods department to their plant. A preliminary list which they issue represents principally the season goods which they are starting on, such as National spray hose nozzles, polished hose nozzles, hose couplings and compression bibs, and stops for iron pipe. In this line the company are expecting to add from time to time large assortments of such goods as will be in demand by hardware and plumbers' supply houses. They also call attention to the Murphy improved trucks for all purposes, which they manufacture, and the Protector woven steel covered hose, which they handle, as lines in which they are doing not only a large domestic business, but also exporting in good quantities. The company also make a line of furniture casters, and are, of course, old manufacturers of bolts, nuts and rivets, having succeeded the Maryland Bolt & Nut Company some years since. They state that business in all their departments for the past year or more has exceeded their capacity, and that they keep their plant right up to date by constantly adding labor saving devices, by which they cheapen the cost of their products while at the same time maintaining their quality.

Sewer Connections to Cesspools.

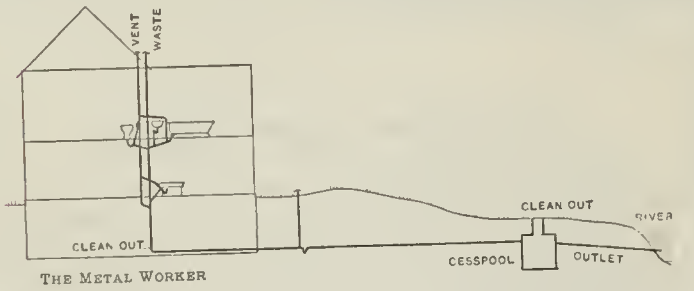
In certain sections of this country cesspools, surface drainage and streams are still used to dispose of the waste from plumbing systems installed in buildings. With a view to learning something of the arrangement of a house drainage system under such conditions, inquiries were made which elicited the following communications from members of the plumbing trade:

A correspondent at Hoquiam, Wash., says:

"There are no regular sewers in this city, which is built on a tide flat. The sewage is carried off in wooden boxes or troughs to the river. A number of such box troughs run through the town site. Originally the main street had a surface sewer with plank sides but without any bottom, and it can readily be imagined what kind of a sewer this made. It has recently been replaced with a closed box. My own residence has a perfect system of plumbing, which drains into a cesspool with an overflow to a nearby stream or slough, as shown in Fig. 1. The intercepting trap with fresh air inlet is located outside of the building and shuts off the odor from the cesspool. It is fixed in such a manner that if the soil pipe, which receives the waste from two closets, one sink, a bathtub, a lavatory and a slop hopper, should at any time become stopped up through accumulation of grease or other matter, it can be cleared from the fresh air inlet by simply working an old style plunger up and down in a short piece of pipe which is calked into the trap. The fresh air inlet has a removable, ventilating cap. This system has been in use for nearly ten years without causing me any trouble, while providing satisfactory ventilation. All of the fixtures of the building are vented through the roof and all the vent and drain pipes arranged in the most approved manner. All of the workmanship has been carefully made perfect, and there is not the slightest odor from any of the fixtures or the piping. My house is the only house in Hoquiam that has a ventilating system and a running trap."

A correspondent at Perry, Ia., writes:

"Unfortunately we have no system of sewerage and are compelled to use private drains and cesspools, and the first question that confronts us is the outlet and the amount of fall which we can secure. After this is obtained we have a basis to work on. To obtain the fall I have a long, accurate level and I use it to sight between the high and low points for distances less than 40 feet with the most gratifying results. The standard pitch for house drains here is ½ inch to the foot. I always try to secure that much and would prefer it to either more or less, even should I be compelled at the end to make a vertical drop. However, I recall one job where I laid 100 feet of 4-inch extra heavy cast iron soil pipe, calked with lead, at a pitch of ¼ inch per foot, that has been in use for five or six years and has never given any trouble. Cast iron pipe is easier laid than glazed terra cotta sewer pipe, particularly when the fall is slight, but I believe that glazed terra cotta sewer pipe is just as good for the outside of buildings, and more durable, at a less cost. I never use anything but extra heavy cast iron soil pipe in, under or nearer to a building than 3 feet from the wall.



Sewer Connections to Cesspools.—Fig. 1.—A Pacific Coast System.

"As to the use of the intercepting trap, I have no fixed rule. With that, like a good many other things in the plumbing business, the location should be governed by good judgment, influenced by the location of the building and the use to which the building is put by the persons occupying it. Sometimes it is located on the inside of the wall, but more often on the outside (as shown in Fig. 2), with the fresh air inlet extending 3 feet above the ground. This arrangement protects the seal of the intercepting trap when it is used, and allows a free circulation of air through the house drainage system. There is no danger of the trap losing its seal from evaporation, as the condensation of the moisture in the air when the building is not used, or the frequent flow of water through it when it is in use, keeps the trap well sealed. If this trap is found empty, a plumber should be called in to see what the trouble is and apply a remedy. I am of the opinion that where an owner refuses to make repairs to a plumbing system in a building, and the defects might have effect on the health of the occupants, the city authorities should order the repairs made and pay for them, charging the expense against the building, to be collected by the proper authorities. If the wall through which the house drain pipe passes is a substantial one there need be no fear about settling at the point where it passes through, though I have seen some walls that it would be dangerous to cut through, and if they should settle and break the pipe, the fault should be traced to its proper source."

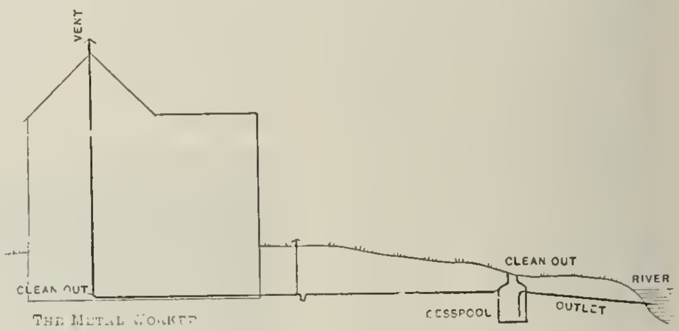


Fig. 2.—An Iowa System.

A New Orleans correspondent states:

"We are now having a system of sewers and drainage canals laid out in our city to drain to a low point, where pumping stations are to be located to throw it where it will eventually find its way to the Gulf. It has been customary, where a plumbing system was used in a building, to allow the refuse to pass to cesspools and vaults for closets and urinals, and the waste from lavatories, bathtubs, kitchen sinks, &c., was allowed to run to the gutter or drain pipe laid on each side of the street. These drain to the suburbs and the refuse is carried to canals outside of the city and thence into the lake. This, however, is to be done away with, owing to the detrimental effect upon the public health.

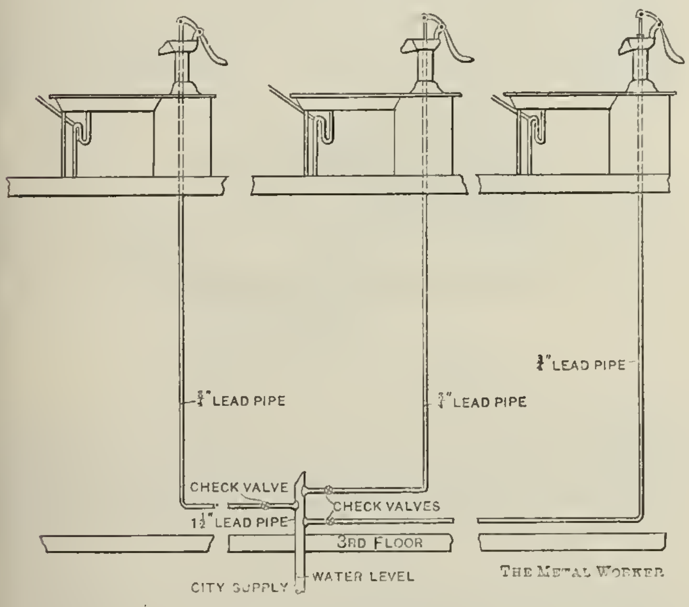
"When the new system of sewers is ready for use, I shall recommend my customers to use the intercepting trap and connect the house drain with the sewer at a point fully 1 foot above the ordinary water level in the sewer. A fresh air inlet and a vent line to the top of the house should be provided, and these should be large enough to allow air to blow in freely from the roof to fill the space behind a rushing slug of water discharging through the waste pipe from some fixture and to flow freely out of the fresh air inlet ahead of this slug of water; otherwise a tendency toward vacuum will siphon some trap or a pressure will force the seal of another. The vent pipe should be carried high enough above the building so that the air which rises through it will be incapable of harm by dilution before it can enter the building. I favor the use of extra heavy cast iron soil pipe, calked with oakum and then lead. If terra cotta pipe is to be used it should be glazed pipe by all means, and it should be laid with a pitch of at least ¼ inch to the foot, but should never be used inside of the building or nearer to it than 3 feet at least.

THOSE manufacturers who make Stoves and Ranges using water backs requiring brass couplings are invited by Rollin C. Wilson, 116 Nassau street, New York, to correspond with him in reference to a special line of these goods which he is offering. These goods are made of high grade metal, and are of neat design and of sufficient weight to stand all the strain of making these connections.

A MULTIPLE PUMP CONNECTION.

BY D. F. N.

The owner of a large private dwelling in New York finding difficulty in getting a tenant for his property, owing to the large office buildings and apartment hotels being built up in the neighborhood, remodeled his building, dividing it up into bachelor quarters of one or two rooms. This required some change in the plumbing, and he put a sink in each set of apartments. When this was done he found that during the day time the water pressure in the street main was not sufficient to raise water above the third story. This was due to the large pumps in the new buildings reducing the pressure in the street mains. Not wishing to go to the expense of a tank on the roof or a pump in the basement, he called upon his plumber to devise some method of supplying water. The plumber suggested putting a hand pitcher pump at each sink and cutting off the 1½-inch lead riser at the third floor, where the water was always found. The end of the 1½-inch pipe was closed and ¾-inch branches were taken from it, as shown in the sketch herewith, to serve as suction pipes for the pumps. After charging each of the pumps and the valves becoming soaked they worked for a short time, but soon began to give trouble. Now and then a small supply of water could be secured; then the supply would stop, when the plumber was again sent for. One of the pumps was set in brisk operation and he discovered that the pump in action was drawing air from the other two pumps. He explained this to the owner and stated that it would be necessary to cut each suction pipe and locate a check valve, as shown in the sketch. When this was done there was no difficulty in securing all the water necessary with very little exertion. The reason that this arrangement has proved satisfactory is that there is always a body of water above the check valve to keep it closed, and the operation of any of the pumps has the effect of pulling the check valve closed tighter, and preventing any air from entering to break the action of the pump.



A Multiple Pump Connection.

The Bartlett Sanitary Boiler.

Charles F. Bartlett, Tenth and Filbert streets, Philadelphia, has sent us a circular showing the London Kitchener range, which is of the steel construction type and equipped with all the modern conveniences. A feature of the circular to which our attention is especially called is the Bartlett sanitary boiler, made with an inverted cone bottom below the line of circulation, so that it becomes a settling place for mud or other deposits, and prevents the water back becoming filled with mud or other substances. At the bottom of the cone is a large blow off opening, through which the contents may be drawn off and the interior thoroughly cleaned. Another feature is that both the connections for the water back pipes are in the side of the boiler, one just above the inverted cone, and the other about a foot higher. Those who have read the article in the Letter Box on "Improvements in Boiler Connections" will be interested in the Bartlett sanitary boiler.

◆

Court Decision on Damage by Electrolysis.

The Court of Common Pleas has found against the City Railway Company of Dayton, Ohio, in an action brought against them for damage done to the water pipes of the city by electrolysis. The decision is as follows:

This Court has no authority in law to compel a change in the system from the single trolley to the double trolley, and, if the same were warranted by the law, the facts would not justify such a change. The defendant has been and is operating its road in a negligent manner, causing continual damage to the water pipes of the plaintiff, for which the plaintiff has no adequate remedy at law, and cannot by any practical method prevent such damage.

It is no excuse in law, and the facts would not justify the defense, that other electric lines in Dayton are contributing to this or doing like damage. It is, therefore, the duty of the Court to enjoin the defendant from so operating its railway and to compel it, within a reasonable time, to introduce such improvements in the system, in order that the operation of the single trolley system authorized by the franchise and contract will be in accordance with the present standard of the art of operating single trolley roads. The plaintiff shall co-operate to that end. All matters of detail can be arranged between counsel and the Court in the final order. The costs will be adjudged against the defendant.

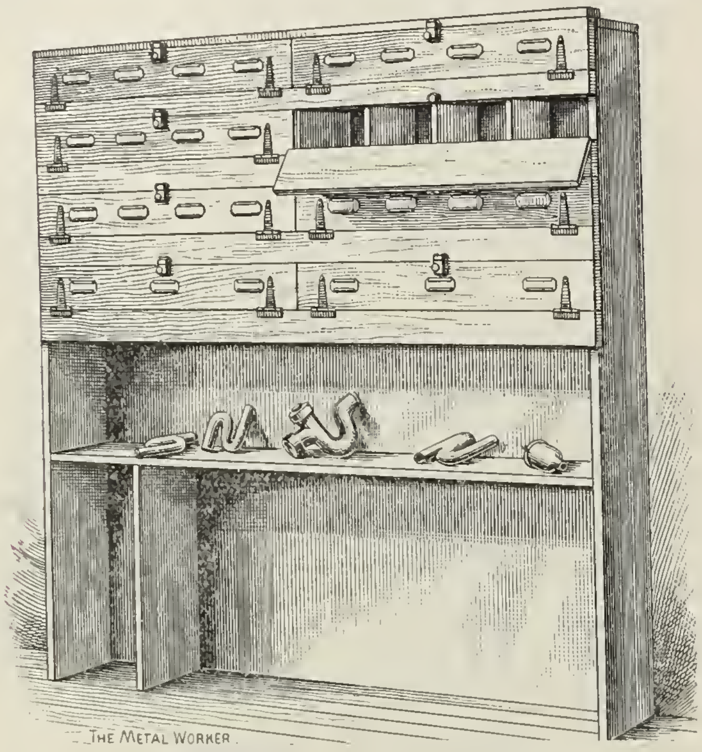
A New Pump Catalogue.

Rumsey & Co., Limited, of Seneca Falls, N. Y., and 35 Dey street, New York City, are sending out the fifty-third edition of their illustrated catalogue of power pumps and hydraulic pumping machinery for all purposes for 1902. It consists of 256 pages, bound in red cloth and provided with a well arranged index. General views are given of the company's plants at Seneca Falls and St. Louis, together with pictures of their branch houses and distributing agencies. The first section of the catalogue includes cistern pumps of the standard open top style, pitcher pumps and round spout pitcher pumps. These are followed by the Maltese Cross anti-freezing cistern and well pumps. A great variety of hand and wind mill lift and force pumps are shown, adapted for attaching to a platform or for fastening to a side wall. The series of wind mill pumps are followed by wind mill stuffing box heads, artesian well working heads and other specialties. Another section is devoted to hand and power pumps for deep well use with heavy balance wheels and pulley fly wheels, with the iron and brass lined cylinders used in such pumps. Drive well pumps, sucker rods, foot valves and strainers, and house pumps, either for attaching to a platform or to a side wall of a building, are followed by similar pumps designed to be operated by a belt from an engine, as well as hand lever oscillating force pumps.

Soda water pressure pumps, double acting ship pumps and pumps of a similar type mounted on platforms with wheels are followed by heavy duty pumps, to be operated by power. Another pump shown is designed for contractors who have to lift large quantities of water from cellars, trenches, &c., containing more or less gravel, mud or other foreign matter. The next 75 pages are devoted to power pumps for lifting water, oil or other liquids under a heavy pressure, and for engine room purposes, together with a complete line of rotary pumps and centrifugal pumps to be operated by steam or gas engines. Several pages are occupied by hydraulic rams, with information in reference to setting them. Plumbers' suction and force pumps and testing pumps are followed by spray pumps for farmers' use, street hydrants, curb boxes and fittings, cast iron sinks, hydrant cesspools, sewer traps and similar fixtures, jack screws, pipe tongs, pipe cutters and stocks and dies. The last section of the catalogue is devoted to garden pumps and small engines for either garden or fire purposes. Several pages give useful information in regard to the company's line of goods and the catalogue closes with a price-list and a code index.

CABINET FOR FITTINGS.

One of two cabinets for holding fittings used in the store of James Wilson, Stamford, Conn., is illustrated in Fig. 1. This cabinet, which stands 7 feet 4 inches high, is 7 feet 2 inches long and is made of 1-inch boards and finished in cherry stain. The upper part of the cabinet is divided into 30 compartments. Across the front and at the bottom of these are run 3-inch strips, the entire length of the cabinet, making small bins. Above each of these strips are hinged two 6-inch boards, 3 feet 7 inches long, which serve as doors for the bins, and are held closed by spring catches. On the front of these doors are nailed pieces of tin for holding the card labels that describe the goods in the bins. These card holders, shown in Fig. 2, are 4½ inches long and 1½ inches high, and are made of ordinary tin plate bent into the shape shown. Fig. 3 indicates the arrangement of the compartments in the cabinet, of which there are 30. Fig. 4 shows the arrangement of the compartments in the other fittings cabinet in the store. The numbers on both Figs. 3 and 4 refer to the articles kept in each compartment, as indicated by the labels on the doors, which are as follows:



Cabinet for Fittings.—Fig. 1.—General View.

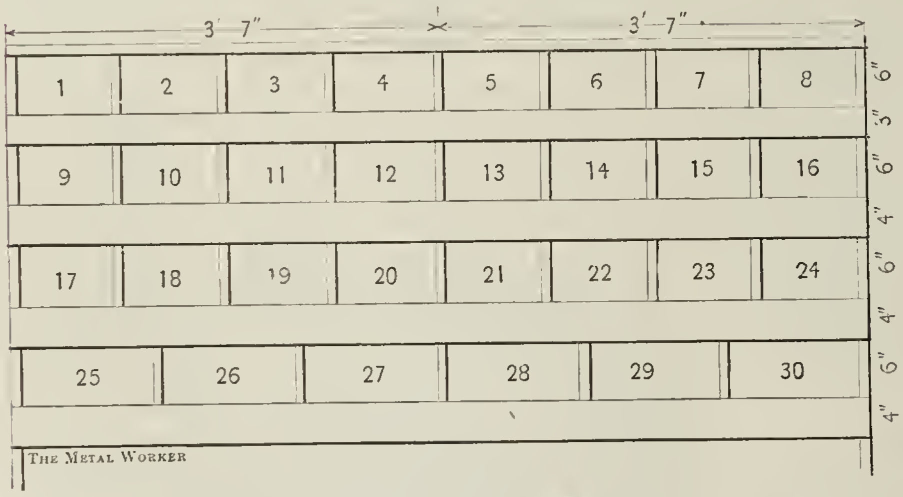


Fig. 3.—Compartments in Large Cabinet.

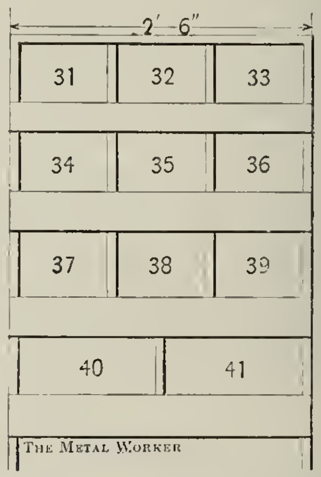

Fig. 4.—Compartments in Small Cabinet.

1. ½-inch stop cocks.
2. ¾-inch stop cocks.
3. 1-inch stop cocks.
4. 1¼-inch stock cocks and check valves.
5. ½-inch stop cocks.
6. ¾ W. B. couplings for iron pipe—male and female threads.
7. ¾ W. B. couplings for lead pipe—female threads.
8. Ball cocks.
9. ½-inch brass soldering nipples.
10. ¾-inch brass soldering nipples.
11. 1-inch brass soldering nipples.
12. 1-inch brass soldering nipples.
13. Wash tray cocks, I. P.
14. Wash tray cocks, S. P. Hamilton.
15. Wash tray cocks with stuffing box for B. N. lead pipe.
16. Copper balls.
17. Basin clamps.
18. Basin plugs and chain stays.
19. ¾-inch draw cocks, I. P.
20. ½-inch draw cocks, I. P.
21. ½-inch draw cocks, I. P.
22. Nickel sill cocks.
23. ⅝-inch Hamilton sink cocks for lead pipes.
24. Hydrant fixtures.
25. Meter cocks.
26. Flange and thimble cocks; meter cocks.
27. Flange and thimble cocks.
28. Boiler spuds.
29. Basin cocks.
30. Brass ferrules.
31. ½-inch Jenkins valves.
32. ¾-inch Jenkins valves.
33. 1-inch Jenkins valves.
34. 1-inch rod valves.
35. 1¼-inch rod valves.
36. 1-inch Jenkins valves.
37. ¾-inch rod valves.
38. 1-inch and 1¼-inch hot water valves.
39. 2-inch globe valves.
40. Patent closet connections; long rubber coupling; straight rubber coupling.
41. Ball cocks.

Long Distance Heating in Germany.

United States Consul-General Richard Guenther of Frankfort reports to the State Department the completion at Dresden, Germany, of the largest long distance heating plant in Europe. From a central station, says the Consul-General, many public buildings on the left bank of the River Elbe, including the theater, the museum, the castle, the royal kitchen, the Custom House, &c., are heated. The greatest distance over which heat is transmitted is ¾ mile. The total heat consumption per hour is 15,200,000 heat units. The usual steam pressure is 2 atmospheres. Ten of the 14 boilers are used, and to guard against accidents two main lines of pipes have been provided. The loss of heat in transmission is from 4 to 4½ per cent. The pipes are protected by two layers of tin, the inner layer being perforated and the outer one covered with silk. The largest pipes have a diameter of 216 mm. (8.51 inches).

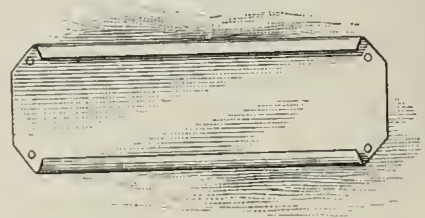

Fig. 2.—Tin for Holding Labels.

FRED. GAMACHE has been granted a license as a plumber at Adams, Mass. He took the examination in Pittsfield, securing an examination average of 100 per cent. He was informed that his work of wiping tank seams was the best passed upon in the past 17 examinations.

Moistening Air.

The process of contributing moisture, in quantities desired, to the moving air which is supplied to the modern public school houses in Rochester, N. Y., says the *Press* of that city, is claimed to contribute materially to the comfort and health of the teachers and pupils an dis warmly approved by physicians. Under the new system the water is evaporated in the boilers and supplied to the moving air in the form of vapor, under conditions which insure automatic regulation. Standards differ somewhat but the ideal English system is said to be air at a temperature of 50 degrees F., with 55 per cent. moisture. The temperature of school rooms in Rochester varies from 60 to 65 degrees F., and the percentage of moisture is somewhat lower than in English practice. When the temperature is at 70, or above, the plentiful supply of moisture is said to make the atmosphere in the school rooms oppressively humid. Under modern conditions this humidity is under absolute control.

It is stated that 15,000,000 cubic feet of air is driven through the rooms and halls of the new No. 6 school building daily. To supply the desirable moisture requires as much horse-power as is required for supplying the pure air. It is held by physicians that the addition of moisture to the air supplied to the school rooms is absolutely necessary, in order to avoid catarrhal and other similar difficulties. The affinity of the air for moisture is so great that absorption of moisture from the system goes on very rapidly, with the bad effects referred to. So great is the amount of water added to the air furnished to the school rooms, that it is stated that the effect is equivalent to that of hanging cloth, saturated wih water, on all of the walls and ceilings. When properly supplied, and not in excessive quantities, the moisture is said to materially improve conditions.

New York City Notes.

Henry Beig, a pioneer in the manufacture of crockery washtubs in this vicinity, whose pottery was on Wallabout street, between Kent and Classon avenues, Brooklyn, died last week after a lingering illness. The funeral services took place on the 20th inst.

* * *

The many friends throughout the country of George F. McQuillen, late plumbing director of the Wells & Newton Company of New York, will regret to learn of his sudden death, which took place on Tuesday. Many members of the Master Plumbers' Association, of which he was an active member, attended his funeral from St. Joseph's Church Friday.

* * *

The Board of Education is trying to keep up its school capacity in proportion with the growing population. James Fay of Manhattan is plumbing two Brooklyn schools situated at Quincy street and Lewis avenue and Sixtieth street and Fourth avenue, and one in Queens on Greenpoint avenue, near Calvary Cemetery. James Harley of Brooklyn is rapidly completing the plumbing in the Girls' High School, at 114th and 115th streets and Seventh avenue, Manhattan.

* * *

D. J. Deady is finishing the overhauling of the plumbing in the Casino in Central Park and expects to start work at once in the new Children's Court House, at Third avenue and Eleventh street.

* * *

The friends of Edward Macdonald, the Brooklyn representative on the Examining Board of Plumbers, presented him last Monday with a large floral horseshoe, expressing the sentiment " Good Luck."

* * *

The George C. Edgar Company recently sold two of the houses on Fifth avenue and Eighty-eighth street where the plumbing is being done by Malcolm & Taylor to Charles P. Huntington of the Southern Pacific Railroad for about $500,000. These houses are the most costly speculative private dwellings erected in the city.

Among the changes recently made by Police Commissioner Partridge was the abolishing of the repair squad and incidentally of the services of the four plumbers employed on it. This will put the police work again in the market, where it rightfully belongs.

Peculiar Example of the Deterioration of Wrought Iron Pipe.

In a communication to the *Proceedings* of the British Institution of Civil Engineers, William Wark reports an unusual experience with wrought iron pipe buried in light sandy soil at Hay, New South Wales. In the year 1885 the gas works were built, and the usual course was adopted of laying the consumers' services of ordinary black wrought iron pipe. The conditions of climate appeared to warrant the expectation that precautions such as are usual in the humid climate of the United Kingdom would not require the same consideration in New South Wales. It was assumed that the dryness of the climate would constitute a factor in the preservation of all iron work, and this has proved to be so, but only in the case of iron not in contact with the soil.

After the lapse of 11 years attention was drawn to a steady increase in the amount of gas unaccounted for, and examination led to the discovery that the pipes had completely perished and exposure to the air had caused them in some instances to crumble to pieces, while in others the granulated appearance of the external surface suggested galvanic action between the metallic base of the soil and the wrought iron. The suggestion that the action of coal gas was in any measure accountable for the corrosion was not upheld by any facts elicited during the investigation. The interior of the pipes may, through the action of impurities in the gas, scale and become filled with rust, but the evidence in case strongly supported the assumption that the injury was due principally to external causes, and this theory is partially borne out by the fact that wrought iron water service pipes, in the town, have a life of only seven years.

The influence of soil in contact with the metal has been held responsible for the structural alteration of its character, but it has not been proved that the deterioration is due to the constituents of the soil, to dampness or to the alterations of moisture and dryness, and it is probable that, owing to the light character of the soil, the great variations of temperature throughout the seasons exercised some influence. Analysis of the soil disclosed the presence of large quantities of common salt and magnesium chloride, in addition to iron, alumina, silica, lime and phosphates. Owing to the dryness, heat and length of the summer season, it is customary to water the streets frequently, and, as they are uniformly level and without any system of drainage, the subsoil is continuously damp. It is conjectured that, as the result of this periodical and frequent street watering, the combination of carbonic acid with the moisture so readily absorbed by the porous earth formed the basis of chemical action, and the alternate moisture and dryness no doubt greatly facilitated the process of deterioration. To all appearance the trouble is confined to wrought iron, the cast mains not showing any signs of unusual injury. Experience in other parts of the colony is quite at variance with that at Hay. In Bathurst, where the soil is of a rotten granite nature, services are still in use, and apparently quite sound, after a life of 27 years.

In relaying the Hay services the preservative measures adopted consisted in applying heat to the pipe and then coating it with boiling coal tar, with a little lime added to neutralize the carbonic acid before application, and in imbedding the pipe in a layer of asphalt. Raw tar is not well suited for coating iron. Instances have been known of damage resulting from its use, the injurious action arising from the presence of carbonic acid. Exception has been taken to the inference that lime exerts a protective influence over wrought iron, since from its hygroscopic character it must act as the vehicle for conveying the very element which it should be the aim to exclude. Where clay is obtainable, puddle is recommended for the envelopment of pipes as a preventive against injury by corrosion.

Painting Hot Water Tank of Iron in Imitation of Copper.

The following instructions are given by the *Painters' Magazine* to a correspondent who asks how to give an iron hot water tank a copper appearance by painting the same and wants to know whether the same will be durable:

We would say that two coats of paint, composed of a first-class baking varnish and pigment, each coat baked on the iron by heat, would be fairly serviceable. If the color is to be a mere approach to copper, a mixture of a bright red with yellow and black, ground in and thinned with high grade baking varnish, would serve the purpose. Or a good copper bronze, such as is used on steam radiators or pipes, mixed with such a varnish as described, might be even better. In this case, when the first coat has been baked on by the heat generated from the hot water in the tank, a second coat, before it has fully set, could be dry bronzed to enhance the brightness of the job. Still another but more troublesome plan is to take the solution of any salt of copper, such as blue stone (blue vitriol), for instance, and place in this pieces of scrap iron, which precipitates the metallic copper. This is collected on a filter, dried and mixed with a high grade baking varnish and applied as suggested in the other methods.

Pipe Joint Paste.

The Wisconsin Graphite Company, Pittsburgh, Pa., manufacturers of Wisconsin graphite pipe joint paste, have appointed the following firms distributing agents for their products, and announce that each of these agents will carry a large and complete stock, guaranteeing prompt delivery to customers: L. H. Tillinghast Supply Company, Providence, R. I.; Frank C. McLain Company, New York, N. Y.; Ronalds & Johnson, Brooklyn, N. Y.; Roe & Conover, Newark, N. J.; Jas. Reynolds, Rochester, N. Y.; Duquesne Supply Company, Pittsburgh, Pa.; National Supply Company, Toledo, Ohio; Jas. B. Clow & Sons, Chicago, Ill.; Marshall Oil Company, Marshalltown, Iowa; E. W. Sellers, Stevens Point, Wis.; Hendric & Balthoffs, Denver, Col.; A. Aschaffenburg Company, New Orleans, La.; Thomas Summerville & Son, Washington, D.C. The company claim that their pipe joint paste has met with remarkable success everywhere, as testified by the large number of orders received by them, not only from the United States, but also from foreign countries. They will be pleased to furnish a sample can of the paste upon application to any who are interested in this class of material.

Heating and Plumbing Notes.

There is a general feeling of regret among the bowlers in the supply trade that the series of games between the supply men of Boston and New York City cannot be arranged this year. The team of the Plumbing and Steam Supply League were successful in winning two games out of three in the contest with the Fire Insurance League team on April 18, but a waterloo was found in store for them when they met the Commercial League team last Tuesday night, for, notwithstanding the fact that they bowled well, the Plumbing and Steam Supply team lost all three of the games.

William O. Needles, a plumber of Columbus, Ohio, has brought suit for $10,000 damage against a number of supply houses and master plumbers of that city, who he claims have entered into a conspiracy to prevent him from securing goods for carrying on his business.

Walls & Pearsall, Philadelphia, Pa., have given out the contract for the erection of a four-story warehouse, 50 x 160 feet, of fire proof construction, on Eleventh street, running through to Hamilton street, with office building on Ridge avenue. This will enable them to handle their specialties in Plumbing Supplies with greater facility.

The plumbers' strike at Reading, Pa., has been settled on a basis of a day of nine hours and a wage of $2.75.

At a recent meeting of the directors of the Federal Boiler & Supply Company, 88 Center street, New York City, a dividend of 1¾ per cent. was declared on the preferred stock, payable May 1.

The plumbing and heating establishment of John O'Neil & Sons, at 218 Main street, Peoria, Ill., was visited on April 15 by a fire, doing damage to the extent of $2000, which is covered by insurance.

C. W. Bowtell, Fort Edward, N. Y., is installing power and machinery in his brick building, at the corner of Taylor and McIntyre streets, and will engage in the manufacture of Plumbers' Brass Goods and Supplies.

The largest order for Pipe Covering ever placed has just been secured by the H. W. Johns-Manville Company of New York from the Pacific Coast Oil Company, a branch of the Standard Oil Company. It is for 280 miles of covering for a line of 8-inch pipe, which the company are laying from Bakersfield to Point Richmond, Cal., on San Francisco Bay, in order to convey their oil to the coast. The shipment will fill about 200 cars. The necessity for using this Pipe Covering arose from the fact that on account of the heavy nature of the oil, it has to be heated to a certain temperature before it can be pumped, and this temperature must be maintained by the oil in the pipes between the pumping stations. In order to do this a nonconducting Covering is necessary.

The E. S. Wheeler & Co. of New Haven, Conn., and 12 and 14 Cliff street, New York, whose business in Plumbers' Supplies covers a wide territory, have just issued a new catalogue containing much matter not found in other publications and made up entirely of half-tone illustrations which really illustrate. The company send it express paid to architects and to their customers only, it being too expensive a book for general distribution. They may publish later a cheaper edition for general distribution.

The Alabama Tube & Iron Company, Birmingham, Ala., have increased their capital stock from $150,000 to $200,000, in order to carry out extensive improvements at their plant at Helena, Ark.

The New York City office of the Maddock Pottery Company of Trenton, N. J., will be removed about May 1 to 25 West Broadway.

Hooker & Lightbody of Jacksonville, Fla., have secured the contract for heating the new Municipal Building in that city.

Charles F. Bartlett, Philadelphia, Pa., has the contract for installing steam heating plants for Charles M. Swain and M. H. Harrington and a combination hot air and hot water heating plant for J. Henry Bartlett.

An interesting feature of the labor troubles in the plumbing trade at Youngstown, Ohio, is the condition of the purposed agreement, which is that the journeymen plumbers shall agree to work only for members of the Master Plumbers' Association. This question is being discussed by the journeymen, as there are two concerns in the town who are not members.

A dispatch from Birmingham, Ala., states that J. A. Gates and others are organizing a stock company with a capital of $50,000 to establish a plant for the manufacture of Enameled Iron Bathtubs.

It has been announced that the American Radiator Company are about to erect a new factory in the East. The company deny this statement, however, the erroneous impression probably arising from the fact that they are erecting an extension to their warehouse at Harrison, N. J., the expansion of their business in the Eastern territory having made such an addition imperative. The new building will be constructed of brick and will be 110 x 145 feet in size, 27 feet high. It will be equipped with traveling cranes for convenience in handling Boilers and Radiation.

W. G. McPherson, a prominent heating contractor of Portland, Ore., was a welcome caller at our Chicago office this week, *en route* to New York.

The Kellogg-Mackay-Cameron Company, Chicago, recently added a Sprinkler department to their extensive business. The advanced rates demanded by insurance companies have made necessary the installation of automatic fire extinguishing systems to a much greater extent than has been anticipated, and the increase in this department has been very gratifying. They now have a large number of contracts to be filled. The installation of these systems is consuming a great deal of Pipe and Fittings.

The Board of Control of Cleveland, Ohio, have adopted a new set of rules for examining plumbers and sewer builders who apply for licenses. The examination includes 30 questions and some practical work. It is said that the examination will be more rigid than heretofore, and that at least 70 points must be reached in order that a license may be secured.

The Wheeling Steel & Iron Company, Wheeling, W. Va., expect to have their new Tube mill at Benwood in operation by June 1. When completed the plant will be one of the finest Pipe mills in the country. It will be supplied with the most modern machinery and equipment. Each machine will be operated by its own electric motor. Electricity will also be used exclusively for all heavy lifting. Electric cranes of the most powerful type have been installed.

The report of Major W. C. Gorgas, chief sanitary officer of Havana, shows an increase in the sanitary work done in and about buildings and cesspools of that city in the month of February. The plumbing division also shows an increase in the work done, 151 inspections having been made during the month and a larger number of applications for permits to do work and of plumbing installations completed being noted.

A feature of the strike among the plumbers of Newark, N. J., is the action taken by the master plumbers to complete a large tenement house for occupation on May 1. On Monday morning 60 of the master plumbers went to work on this building and will continue until the plumbing work is completed. They will receive $3.50 per day for their labor in helping out one of the members of their association.

F. M. Lutschg, Great Bend, Kan., will receive bids until May 14 for installing a hot water heating apparatus in the Barton County Jail, at Great Bend.

A fire visited the plumbing shop of Lindsay & Dodds at Amsterdam, N. Y., last week, caused by a workman falling while carrying a lighted candle, which set fire to some oakum. The fire was soon put out with but small loss.

The plumbing for 57 double tenement houses, to be erected at Rumford Falls, Maine, has been awarded to F. & C. B. Nash of Portland, Maine, at their bid of $9397.

The C. F. Rock Plumbing Company, St. Joseph, Mo., have been awarded the contract for the steam heating plant in the German-English School in that city.

Lewis & Kitchen of Kansas City, Mo., have been awarded the contract for placing a hot blast system of heating in the Everett School, at St. Joseph, Mo.

The Detroit Range Boiler Company, Detroit, Mich., will build an addition, 100 x 110 feet, to their plant, which will be used for storage and for pickling and galvanizing.

The Pipe foundry of the Central Foundry Company, at Lansdale, Pa., which was closed last summer, is about to be acquired by a new company, who, it is understood, will make heavy castings.

The National Hardware & Malleable Iron Works, Thomas Devlin & Co., Philadelphia, Pa., have purchased 50 acres of ground at Burlington, between the Delaware River and Pennsylvania Railroad, where they will erect a new plant.

The Gallup Hardware Company, Port Allegany, Pa., have engaged George H. Smith, formerly of Angelica, N. Y., to take charge of their plumbing and heating department, which they have opened in connection with their Hardware business. The company will be pleased to receive catalogues and price-lists from manufacturers and dealers in goods in these lines.

The James P. Wood Company, Philadelphia, Pa., will install a boiler and alter the steam supply system in the Bellevue Hotel at Broad and Walnut streets, that city, at a cost of $3000, and will install a low pressure steam heating plant in the building 1416 Walnut street, to cost $1000, both for George C. Boldt.

John Brown, whose death occurred on Saturday in Brooklyn, N. Y., was once one of the wealthiest plumbers in that city, his wealth being estimated at $100,000. He was born in Paterson, N. J., 60 years ago, and in 1868 started in the plumbing business at 857 Fulton street. He has been a member of the National Benevolent Legion and of the Volunteer Fire Department and of the Andrew Jackson Club of the Twentieth Ward. He failed in business four years ago, and lost all he had.

I. Koblitz & Son, plumbing contractors, have leased the store room from Louis Poplowsky, at 347 Prospect street, Cleveland, Ohio, and are installing a plumbing shop and display room. They will operate this down town store in addition to their Broadway shop.

The Mankato Plumbing & Heating Company, Mankato, Minn., sustained a slight loss by fire in their shop on April 15.

New Firms and Changes.

The Porter Valve & Mfg. Company of 419 Market street, Camden, N. J., have been incorporated by David W. Porter, S. B. Witherspoon and Herman C. Smith with a capital of $50,000, to manufacture Valves, &c.

The Furlow Sanitary Brass Works Company of Philadelphia have been incorporated with a capital of $50,000 to manufacture Sanitary Plumbing Fixtures and Supplies.

Smith & McNeil, plumbers and tinsmiths, who have succeeded to the business conducted for years by John W. McCarthy, at Port Chester, N. Y., will have their shop and office in the McCarthy Block, on North Main street.

T. F. Leonard of Marlboro, Mass., has started in the plumbing business at 3 North Main street, Wellesley, Mass., under the name of the Natick Plumbing, Heating and Stove Company. Mr. Leonard already has many Natick contracts on hand besides a large plumbing contract for N. C. Griffin of Cochituate.

The Woodworth-Evans Company of Pittsburgh, Pa., will apply for a charter early next month. The company will succeed Woodworth, Evans & Co. in the manufacture of Plumbers' Brass Supplies and the retailing of Stoves and Ranges. The incorporators are: Austin M. Woodworth, Frank R. Woodworth and N. F. Savage. The company are operating a brass foundry and finishing plant at 434 Second avenue, Pittsburgh, which will be enlarged.

The United States Tube Company of Buffalo, N. Y., have been incorporated with a capital stock of $1,000,000, to manufacture Metal Tubes, Flues, Pipe and other metallic articles. The directors are: H. R. Flagler, C. H. Twist and H. C. Diehl of Buffalo; A. W. Thomson, Cleveland; G. W. Dickinson of New York; G. B. Royce of Rutland, and O. S. French of Fremont, Ohio.

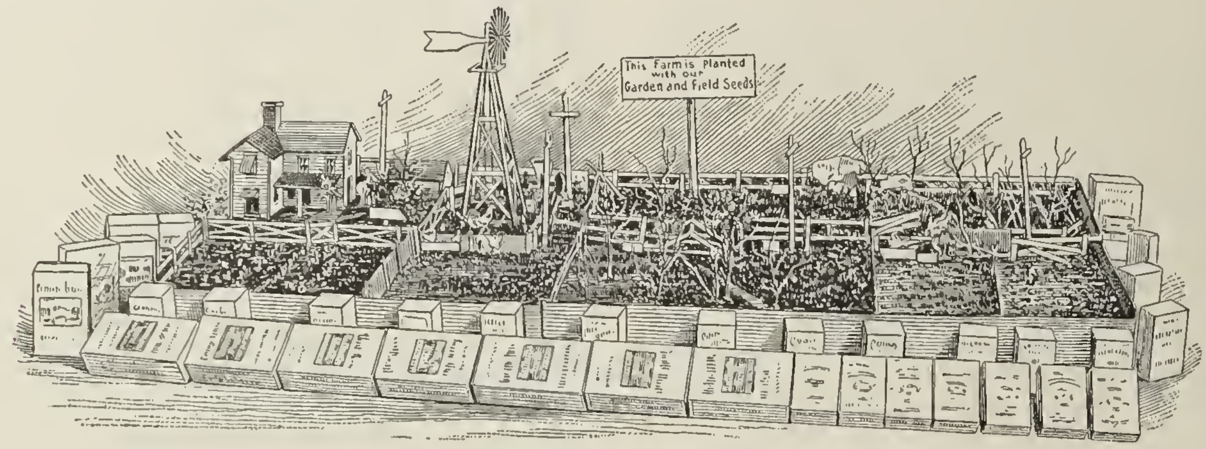
The Keystone Valve Mfg. Company of Pittsburgh, Pa., have been incorporated with a capital of $10,000 by J. D. Riley, W. A. Larimer, W. H. McCully, W. J. Simpson and S. McKay. The company will erect a plant for the manufacture of Valves.

Storms & Co. have filed articles of incorporation to conduct a general plumbing and heating business, with principal office at 112 Fourteenth street, Newark, N. J. The capital stock is $10,000, of which $2500 is paid in by John G. Storms, Sarah Kelly and John Mullin. The concern will acquire the business conducted under the same name, at 40 Thomas street, Newark.

The Cedar Rapids Plumbing Company, Cedar Rapids, Iowa, have been incorporated with a capital of $10,000 to conduct a general plumbing business. Their showroom will be at 321 First avenue. The officers are C. E. Brown, president; G. H. Bollman, vice-president; James L. Beyer, Jr., treasurer, and Robert Palmer, secretary.

A Miniature Farm.

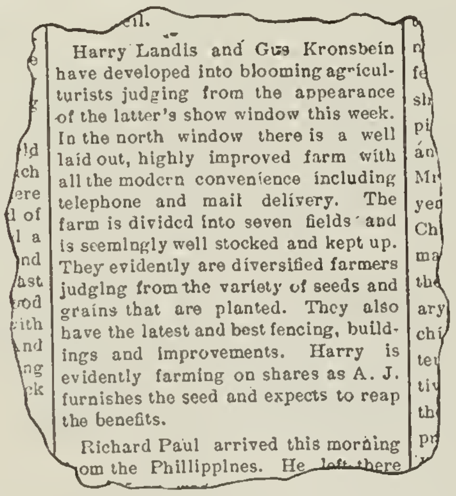
A miniature farm, complete with farm house and other buildings and with fields verdant with growing crops, attracted much attention last spring to the show window of Aug. J. Kronsbein, Malvern, Iowa. This farm, which is shown in Fig. 1, measured 8 feet long by 3 feet wide, and was placed in a wooden box, with the earth so graded as to represent a side hill farm. It was well laid out, and gave the appearance of being a highly improved farm, with all the modern conveniences, including the mail box for rural delivery and telephone. Mr. Kronsbein sells most of the things appearing on the farm, such as the Fencing, Wind Mill, Grindstones, &c. He makes a specialty of Farm and Garden Seeds, and has a variety planted in each of the seven fields in his miniature farm.



This Farm is Planted with our Garden and Field Seeds

Fig. 1.—Miniature Farm in Show Window.

This window proved so popular that a crowd would be found standing in front of it almost all the time. The sales of seeds are said to have largely increased over previous years, due in a large measure to the window advertising given by the display. The notice shown in Fig. 2 from a local weekly paper shows the kind of a press notice that may frequently be gotten without expense.



Harry Landis and Gus Kronsbein have developed into blooming agriculturists judging from the appearance of the latter's show window this week. In the north window there is a well laid out, highly improved farm with all the modern convenience including telephone and mail delivery. The farm is divided into seven fields and is seemingly well stocked and kept up. They evidently are diversified farmers judging from the variety of seeds and grains that are planted. They also have the latest and best fencing, buildings and improvements. Harry is evidently farming on shares as A. J. furnishes the seed and expects to reap the benefits.

Richard Paul arrived this morning om the Phillippines. He left there

Fig. 2.—Newspaper Notice of Display.

This serves as a good advertisement, and is so written that it is good news for the paper, being interesting to the readers.

◆

Our London correspondent suggests a useful tip in connection with packages sent with goods to Australia. Under the new Australian tariff all packages have to pay duty in addition to the goods they contain. He suggests that tanks for water storage be used for this purpose, instead of wooden cases and casks, there being quite a demand for water tanks in Australia. An English firm are meeting this condition by manufacturing a tank with a neatly fitting lid fastened with screws and nuts, thus dispensing with the ugly bunghole in the lid.

TRADE NOTES.

The Standard Metal Mfg. Company have been incorporated at Newark, N. J., by George Alfred Brown, Millard W. Baldwin and Frank R. Serles, with a capital stock of $100,000, of which $100 is paid in. They will manufacture Metal Articles of all sorts.

Golding & Co., 540 Pearl street, New York, are sending to those who employ a large force of draftsmen an interesting catalogue showing an outfit for printing on tracing cloth. It also contains a number of testimonial letters from railroad and other shops where the company's printing outfit is used for printing the titles and explanations on drawings in the drafting rooms.

The Genesee Metal Works of Rochester, N. Y., have been organized by Levi Hey, Ernest C. Hazard, George R. Coates, F. W. C. Reidenbach and John Bennett to manufacture various Metals, including Phosphor Bronze, Phosphor Copper, Manganese Bronze, Ingot Brass and Babbitt Metals. Mr. Reidenbach will be the general manager of the company.

The Marlin Fire Arms Company, New Haven, Conn., have issued an attractive catalogue of 120 pages in the interests of their Marlin Repeating Rifles, Shotguns, Shells, Loading Tools, Sights, &c.

The Monongahela Foundry & Forge Company, recently incorporated with a capital stock of $50,000, have secured the buildings formerly occupied by the Pittsburgh Stove & Range Company, at Monongahela City, Pa., and will there make Gray Iron Castings and Forgings.

A large addition is to be built to the North Brothers Mfg. Company's plant at Philadelphia, consisting of a brick building five stories in hight, measuring 25 x 40 feet.

The S. Obermayer Company, Cincinnati, Ohio, have closed a contract for furnishing a quantity of Foundry Supplies and Foundry Facings for the new plant of the British Westinghouse Electric & Mfg. Company, Limited, at Trafford Park, near Manchester, England.

A. L. Pedersen & Co., 321 East Thirty-fifth street, Chicago, are manufacturers of Metal Patterns in Brass, White Metal and Aluminum. The firm have been established for some time, have built up an excellent reputation for quality of workmanship, and are now extending their operations to include a much wider field than that to which they have hitherto applied their energy.

The National Lead Company of New York City suffered a $150,000 loss by fire at their plant on Front street, Brooklyn. The factory was equipped with expensive machinery and was almost totally destroyed.

◆

A record breaking run of 14.8 miles from Eckley to Wray, Col., was made recently by a train on the Burlington road. The distance was covered at the rate of 98.6 miles an hour.

C. M. Schwab has agreed to defray the expenses of adding an auditorium to the Industrial and Manual Training School that he is having erected in Homestead, Pa.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PLUMBING A TENEMENT.

From E. F. N., New York.—Having read the request of "A. O. B." in *The Metal Worker* of April 5 I present the following for his information: It would have been easier to have given him the information he desired if he had presented complete plans of the different floors on which the bathrooms and kitchens are located. If the bathrooms adjoin, one partition forming a dividing line between the two buildings, one line of 5-inch soil pipe would be sufficient to carry off the waste. A 5 x 4 inch cross could have been inserted to receive the waste connections from the fixtures on each side of the main partition. The branch running over to the water closet, shown in Fig. 1, should have a 4 x 2 inch T Y inserted to receive the waste from the basin and bathtub, and a 4 x 2 Y near the lead bend of the closet to receive the waste from the wash trays and sink. I have assumed, however, from the plan given, that it would be impossible for one 5-inch line of soil pipe to be arranged so as carry the waste from all the fixtures, and have shown in Fig. 1 a plan of the waste and vent pipes, including a 4-inch main soil pipe and a 3-inch vent pipe. Fig. 2 is an elevation showing how the pipes would be run, the traps located and the vent pipes connected. If there are no fixtures, like a closet or a sink, in the basement, the 3-inch vent pipe could be connected with the main soil stack just below the basement ceiling. The plan shows the bathroom with two outlets, or doors, making it necessary to cross the room with the vent pipes to reach the 3-inch main vent stack; consequently a 3 x 2 inch Y must be placed on the vent stack above the ceiling in each bathroom, and 2-inch galvanized wrought iron pipe must be carried from this branch, crossing the ceiling and dropping down in the partition wall to connect with the fixtures. It is best for it to be stopped at 2 feet 8 inches above the floor, and have lead branches connected with the crown of the traps, as shown in Fig. 2. In roughing in, it will be easier to use all half S traps for the sink, baths and wash trays, and to have the traps to discharge straight to the wall. The horizontal outlet of the trap should be 8½ inches above the floor for the wash trays, 16 inches for the basins and 16 inches for the sinks. The measurements for roughing in the pipes for the water closets, if they are of sanitary earthen ware, can be secured from the supply house, who will give the distance from the wall to the center of the lead bend. Fig. 2 shows in elevation the main water service pipe, which should be of 1½-inch galvanized iron or lead pipe, with ¾-inch branches to supply the different fixtures. This pipe should have a stop and waste cock, so that the water can be shut off and the system drained when the building is closed.

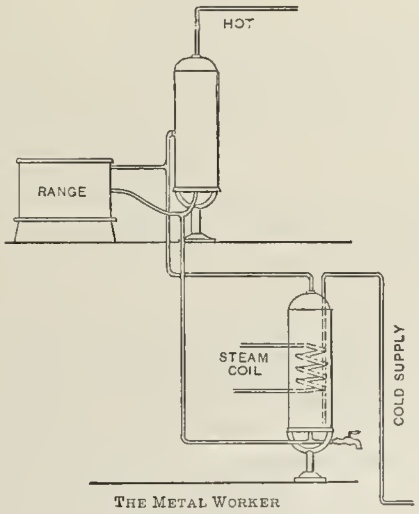
A PROBLEM IN BOILER CONNECTIONS.

From H. F. S., Merrill, Wis.—In reply to the letter of "B. H. C." in *The Metal Worker* of March 1, I would say that I have connected two boilers as shown by the accompanying sketch, and they work very satisfactorily. The difference between my job and his is that in my case the upper boiler was heated from a range while the lower boiler was heated by the steam coil. But this would make no difference, as they work either way as connected. I cut off the cold water supply from the upper boiler and attached it to the lower one. I then took a pipe from the bottom of the upper boiler and carried it to the bottom of the lower boiler, and ran a pipe up from the top of the lower boiler to the side connection in the upper boiler. This gives all the hottest water to the upper boiler, and when hot water is drawn for bath or other purposes it does not disturb the temperature of the water in the upper boiler by letting the cold water in, as the cold water feeds directly to the lower boiler, and when water is drawn the hottest water in the lower boiler passes to the upper one. If the lower boiler is the only one heated, the hottest water will still go to the upper boiler. If the upper boiler is heated by the range and there is no steam flowing into the coil in the lower boiler it will work the same as if only one boiler was



The Metal Worker

A Problem in Boiler Connections.

connected. The connection sugested by "I. H. S.," in *The Metal Worker* of March 8, may work all right, but if a strong fire was run at both boilers it might raise steam, which would rise to the top of the hot water service pipe of the upper boiler and cut off circulation in the upper boiler.

Note.—An error was made in the cut used with this article, as it was presented in *The Metal Worker* of April 12. It is repeated with the cut herewith showing the correct piping.

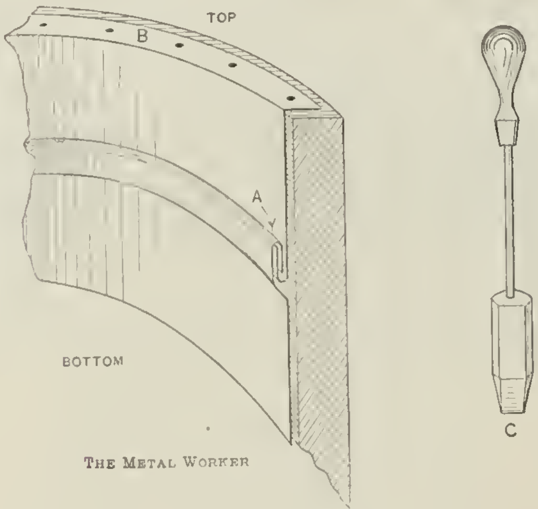
MARKING FLUID FOR GALVANIZED IRON OR ZINC.

From C. S., New York.—Would you kindly inform me how to make the mixture for a good marking ink for galvanized iron and zinc?

Answer.—Take a small bottle and partly fill it with muriatic acid, into which put a small quantity of copper filings—that is, the filings from the soldering copper, which have been filed previous to tinning. Allow it to stand a few days until the acid turns to a dark blue color, when it is ready for use. Take a piece of hard wood and point it similarly to a pencil. By dipping this into the fluid the zinc or galvanized iron can be marked with it as desired.

LINING TANK WITH GALVANIZED IRON.

From E. and W., Grand View, Montana.—We have taken the job of lining the tank for the water works here with No. 28 gauge galvanized iron. The tank is 12 feet in diameter by 18 feet deep. We would be glad if *The Metal Worker* would advise us what size sheets to use, and how the difficulty of soldering the upright seams can be overcome.

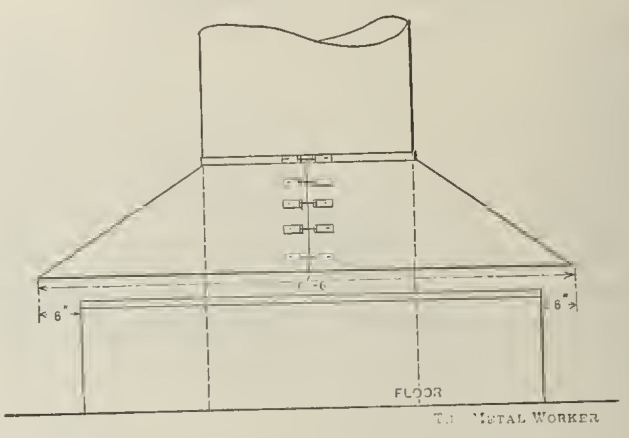


Lining Tank with Galvanized Iron.

Answer.—We would advise our correspondent to use No. 24 gauge galvanized iron for a large tank of the above size, in sheets 36 x 96 inches in size, locking the horizontal and vertical seams and thoroughly soaking the seams with solder. When lining the tank, it can be started at the top, as shown in the accompanying illustration, flanging out at the top and nailing, as shown at B, interlocking each successive sheet, as shown at A. This brings the lock opening toward the top. Then, with a hot heavy copper, using muriatic acid as a flux and half and half solder, thoroughly soak the seam with solder. By having the lock as at A the seams can be well soldered, using the edge of the lock as a guide for the copper. The upright seams are soldered in the usual manner, being careful to forge the coppers wedge shape, as shown at C, about 1½ inches wide and ¼ inch thick at the end. They should be tinned on one side and the end only; if tinned otherwise—that is, on three or four sides—the solder, instead of remaining on the tinned side would flow downward. By having the copper tinned on the one side only the remaining sides are black, and do not tend to draw the solder downward. It is better to go over the upright seams twice, so as to get a good tight joint.

A DISPUTED BILL.

From J. B., Brooklyn, N. Y.—I should be glad to hear from the readers of your valuable paper in reference to the following experience: The owner of a building in course of erection wished to have a galvanized sheet iron umbrella cover made to fit a smoke stack, which was at the time lying in a vacant lot near the building in two sections. In giving the order to have the umbrella cover made the owner gave the measurements of one end of the stack as 30 5-16 inches, but he failed to mention that the smoke stack was flatened on each side so as to reduce the diameter 5-16 inch at each side at the point where it passed through the roof. He also failed to mention that he was having the smoke stack run up 6 inches to one side of the center of the opening in the roof of the building. The man who built the stack and erected it, in giving the order for the umbrella cover gave no information further than that it was to be a cone cover 6 feet 6 inches in diameter at the bottom, the order being a verbal one. The owner expected that when the work was completed it would be arranged as shown in Fig. 1, while through negligence in properly placing the order it was as shown in Fig. 2. On presenting the bill for the work he refused to accept it. I should like to know who is to blame?



A Disputed Bill.—Fig. 1.—The Finish Expected.

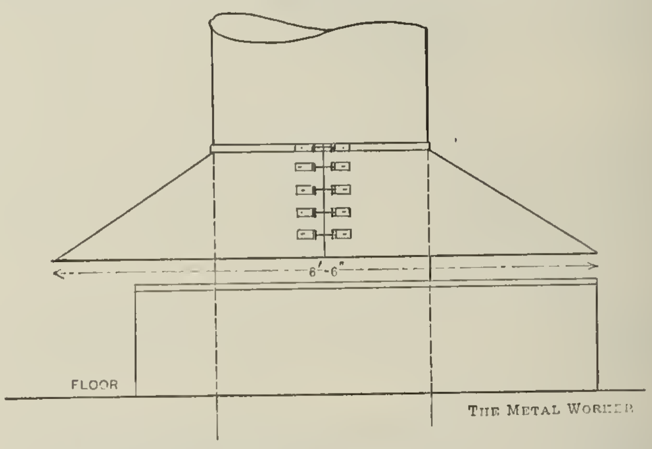


Fig. 2.—The Unsatisfactory Finish Due to Error in Giving Order.

WANTS "ESSAYS ON HOUSE HEATING."

From T. J. Grier, Post Office Box 84, Martin's Ferry, Ohio.—I am desirous of procuring a well preserved copy of "The Metal Worker Essays on House Heating," and shall be glad to hear from any reader who has a copy that he is willing to sell, stating the price.

ADDRESS WANTED.

From T. F. Clark, Box 303, Danville, Ky.—I desire to secure information as to the whereabouts of Richard McAuliffe, a steam fitter, well known in the trade as "Dick." He was formerly in Chicago, Ill., and his parents resided at Columbus, Ohio. He worked in Memphis, Tenn., and was last heard of in Birmingham, Ala. If he will write to me he will learn of something to his interest.

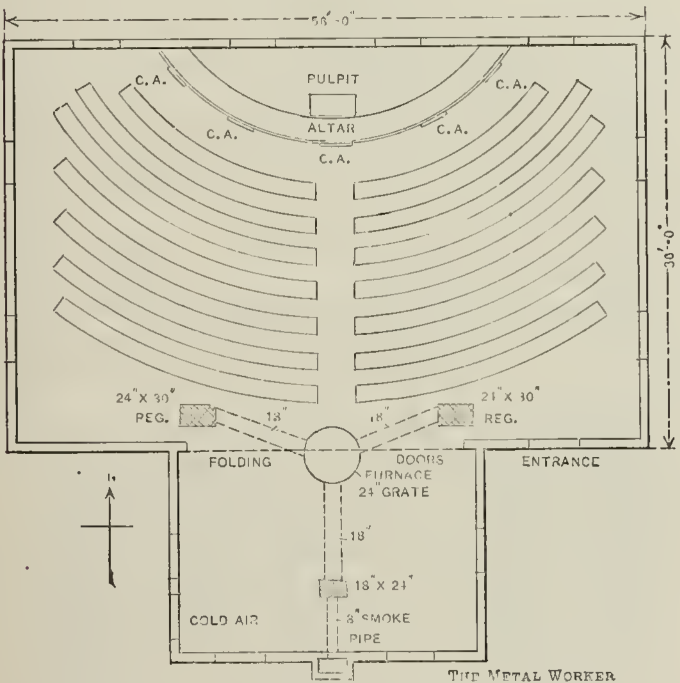
ZINC RODS BREAK.

From F. B., New York.—I would like to know what causes zinc rods to break very easily ? I have cast some in a mold to use in batteries for experimental work. but they seem to be very brittle, while those bought are tough and hard. I use only pure zinc, melting it in an iron pot, with a charcoal furnace. Is there any metal or alloy that can be put in the zinc which will harden it, and not interfere with its service in the electrical battery ? Any information which the readers of *The Metal Worker* can give will be appreciated.

Answer.—Pure zinc has considerable strength, and is strong enough for battery purposes. There is no alloy or other metal that will strengthen it that is permissible for battery use. Mercury is used, but it makes the zinc of less strength. We fear that the zinc used by our correspondent was not pure, or even commercial zinc. If old battery zinc was used, which might be thought pure, it may have been the cause of the trouble, as such zinc is usually amalgamated with mercury.

SCANT AIR SUPPLY HINDERED HEATING.

From L. P. C., Leipsic, Ohio.—Will *The Metal Worker* or some of its readers advise me why the heating system arranged as shown on the plan herewith will not heat the church ? The only register that shows a good flow of hot air is the one in the Sunday school room above the furnace. The other two hardly show any flow of hot air at all, notwithstanding that the smoke pipe gets red hot and a great deal of fuel is consumed without benefit. It was designed and put in by a Cincinnati house, and the original intention was to take the air from the church through registers placed in the risers leading to the altar, but this was afterward changed, as it would not work. The air is now taken from outside. The floor at the pulpit is about 2 feet lower than at the hot air registers. I believe that the smoke pipe is too small, as it is but 12 feet long.



Scant Air Supply Hindered Heating.

Note.—No doubt some of our furnace readers can give valuable information which will assist this inquirer. In the meantime, we would suggest that the air supply seems to be insufficient. There are three 18-inch hot air pipes, which seem pretty large to be supplied from one furnace having a 21-inch fire pot, as their area is 254 square inches each, with a total of 762 square inches. The size of the registers at the pulpit is not given, nor is the size of the fresh air supply duct. The outside measurements of the registers at the pulpit should have provided an area of twice the 762 inches, in order to allow for the obstruction due to the fret work in the register face and the obstruction due to friction. These registers should then connect into a duct not less than 20 x 40 inches, or of at least 800 square inches capacity, leading back to the furnace. The cold air box from out of doors should be of the same size, and at no point should the area be reduced. For heating churches, it is well to take the air from the church building before the congregation assembles, then to use the air from out of doors. Such heating systems are more likely to provide a comfortable temperature than when the entire air supply is taken from out of doors. Judgment should be used in the regulation of the air supply, so that as soon as the congregation assembles the inside air supply should be shut off and the outside supply used. It also seems that the furnace used is not as large as would be desirable from the size of the building and the location of the furnace in it.

WHAT WILL REMOVE THE SOOT?

From C. H. R., Catskill, N. Y.—I have a customer who has a hot water heater in which he has burned a large quantity of wood, which has formed a black, sticky substance all over the flues. I should like to know what will remove this substance, and whether there is anything that can be burned in the heater that will remove it ? I hope that some of the readers of *The Metal Worker* who have had experience will give me the benefit of their views.

Which Way Pocket Level.

E. G. Smith, Columbia, Pa., is manufacturing the Which Way pocket level, shown herewith, which is now being brought to the attention of the trade. The level is about the diameter of a silver dollar and ⅜ inch thick. It is referred to as made from solid steel and

Which Way Pocket Level.

nicely nickeled. The lens is ground glass. Special attention is called to the sensitiveness of the level, and the manufacturer remarks that it does not matter which way the work is out, the level will show it. The level is guaranteed not to leak.

To Judge a River's Breadth.

It is necessary to make use only of the eyes and the brim of a hat to measure the width of any ordinary stream, or even of a good sized river, and here is the way to do it, says the Detroit *Free Press:* Select a part of the river bank where the grounds run back level, and, standing at the water's edge, fix your eyes on the opposite bank. Now, move your hat down over your brow until the edge of the brim is exactly on a line with the water line on the other side. This will give you a visual angle that may be used on any level surface, and if, as has been suggested, the ground on your side of the river be flat, you may " lay off " a corresponding distance on it. To do this you have only to hold your head perfectly steady, after getting the angle with your hat brim, supporting your chin with your hand. if necessary, and turn slowly around until your back is toward the river. Now, take careful note of where your hat brim cuts the level surface of the ground as you look over the latter, and from where you stand to that point will be the width of the river—a distance that may readily be measured by stepping. If you are careful in all these details you can come within a few feet of the river's width.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin rules about ½c. lower, and is quiet, though firm.

Copper has softened about ¼c. in price and is very dull.

Pig Lead is quiet and unchanged.

Spelter remains quiet and a trifle weaker.

Antimony is unchanged.

Nickel is active and without change.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged and firm.

Sheets continue in heavy demand; prices strong, with upward tendency.

Scrap Iron is easier on a less urgent demand and larger supplies.

Foundry Iron is scarce to the point of famine in some quarters, and prices are higher.

Sheet Copper is in heavy demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume, although orders are not so heavy; prices remain strong.

Plumbers' Supplies are active, with prices firm in all lines.

Wire Nails continue in good demand, with prices strong and assortments broken.

Cut Nails are in similar condition to Wire Nails.

White Lead is in good demand at unchanged prices.

Linseed Oil has been advanced 3c. a gallon.

Spirits Turpentine is ½c. a gallon lower, with limited demand.

METAL MARKET.

New York, April 25, 1902.

Pig Tin.—Prices of Pig Tin in London fell rapidly in the early part of the week as the result of a halt in the bull movement there. There was an accompanying decline here, but it was not as marked as in London. Business has been very limited, buyers purchasing only such amounts of material as they absolutely need for present requirements. On Thursday the decline was checked and a decided improvement in the tone of the market set in, leaving it at the close firmer than for some days previous. Jobbers' prices are about ½c. below those ruling at the date of our last report, Straits Pig in small lots being quoted at about 29c. to 29½c. per lb. Arrivals of Pig Tin this month have been very heavy, the total so far being over 3500 tons. It is predicted that the arrivals for the entire month will reach fully 4200 tons. These figures leave no room for apprehension over a possible scarcity of supplies in this country. The fact that consumers here are buying so sparingly is evidently caused by the feeling that there will be plenty of Tin to tide them over until the situation has been cleared.

Copper.—An irregular market has prevailed throughout the week, with a general tendency downward. Purchases were confined entirely to small lots, as the bulk of consumers are still well supplied with Copper bought at lower prices. Lake Ingot in small lots is quoted at about 13c. to 13½c. per lb., and Casting Copper at 12¾c. to 13c.

Sheet Copper.—Manufacturers of Sheet Copper report a very active demand for this material, coming from all the various interests that use Sheet Copper. A considerable increase over former seasons is noted in the demand for Sheet Copper for architectural purposes. Much of this material is being put into the large new buildings that are now being erected in various parts of the country. The mills generally are running to their full capacity. Manufacturers, apparently, are not anxious to book orders for very long deliveries, and are understood to be unwilling to accept contracts for delivery beyond three months at present prices. Prices are very firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—No change is noted in this market, which remains dull and uninteresting, but steady at former prices. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report a quiet condition of the Pig Lead market at that center, with no change in prices since last week.

Spelter.—The market for Spelter is without change. Consumers are still buying from hand to mouth. In some quarters it is held that the tone of the market is a little easier, but there has been no change whatever in prices. Small lots of good Western brands rule at about 4.60c. to 4.70c. per lb. St. Louis advices report transactions in the Spelter market there as of a lighter order, with a general quietness ruling and no change in quotations.

Sheet Zinc.—A fair demand for Sheet Zinc is reported, with prices at the same figures ruling for a long time past—viz., 6¾c. per lb. for 600-lb. cask lots, and 7c. to 7¼c. for smaller quantities.

Antimony.—The market for this metal is unchanged, Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb., United States at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—The situation is unchanged. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues good, and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is entirely unchanged. The American Tin Plate Company are quoting for delivery until October 1 at the prices which have ruled for the past year. No increase in the amount of new business is reported, although deliveries from mills are still being made on a heavy scale. These, however, are mainly on contracts previously placed. Most of the large consumers are said to have covered their wants for some little time to come. The retail trade is rather quiet. Prices are firm and unchanged. American Bessemer Coke Plates, IC, 14 x 20, are quoted at about $4.85 to $4.95 per box for moderate sized lots, delivered at New York or corresponding points.

Sheets.—The demand for Sheets seems to be a little less pressing than it has been the last few months, but it is still quite heavy. The Sheet mills, as a whole, are comfortably filled for the next two or three months, and the market is very firm, with upward tendency. Some makers have advanced their quotations on Heavy Sheets. Some cutting of prices on Galvanized Sheets is reported in the retail trade in the East, but this has not affected the general market prices to any noteworthy extent. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at about 3.85c. to 3.90c., and Galvanized Sheets at 70 to 70 and 2½ per cent. off the list.

Chicago advices are as follows: The buying of Sheets has continued liberally, checked only by the inability of the mills to make deliveries. One feature of the week has been the buying of Light Sheets for implement purposes. A strong and confident tone prevails with full prices realized, and in some instances advances asked and obtained, but trading is mainly in small quantities for early delivery. Heavy Sheets have been advanced about $3. Small lots of No. 27 Black Sheets from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store being held at 4.70c. to 4.75c. for No. 27.

Old Metals.—Stocks of Scrap Iron are increasing, and the demand is not so active. Prices are somewhat weaker. Scrap Brass and Copper have also weakened in price on lighter demand. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10 c.
Light and Tinned Copper	per lb. 8½c.
Heavy Brass	per lb. 8 c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2⅞c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 15 c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	8.50 to 9.00
Burnt Iron, per gross ton	7.00 to 7.50

THE PIG IRON MARKET.

New York.—Beyond moderate sales for early delivery, at fancy prices, very little new business is being done in Pig Iron. There are reports relating to the importation of moderate quantities of foreign Foundry Iron. The market continues exceedingly strong. We quote for forward delivery, Northern Irons: No. 1, $20.50 to $21; No. 2 X, $19.25 to $19.75; No. 2 Plain, $18.75 to $19.50, at tidewater. Tennessee and Alabama brands are as follows: No. 1 Foundry, $19.50 to $20.50; No. 2 Foundry, $18.75 to $19.

Chicago. Strength continues to be the prominent feature of the Pig Iron market. Although the official Southern base price is unchanged, there has been an advance of 50c. per ton in the actual trade prices for both local and Southern Irons. In some instances Northern Iron has been sold at $1 to $2 higher, and even greater premiums have been demanded and paid for Iron for immediate and nearby delivery. The volume of business, however, has been restricted within relatively narrow limits, there being but little Iron available for prompt shipment, and the majority of large melters having covered their wants for the remainder of the year. The current demand is mainly, if not entirely, for Foundry Iron. While the official prices of the leading Southern companies remain based upon $12, Birmingham, for No. 2 Foundry Iron, actual business is done at $3 per ton higher. The following f.o.b. Chicago quotations are therefore given on the basis of actual transactions:

Lake Superior Charcoal	$21.50 to $22.25
Local Coke Foundry, No. 1	19.50 to 20.00
Local Coke Foundry, No. 2	19.00 to 19.50
Local Coke Foundry, No. 3	18.50 to 19.00
Local Scotch, No. 1	19.00 to 19.50
Ohio Strong Softeners, No. 1	21.10 to 21.35
Southern Silvery, according to Silicon	19.90 to 20.40
Southern Coke, No. 1	19.40 to 19.90
Southern Coke, No. 2	18.65 to 19.15
Southern Coke, No. 3	18.15 to 18.65
Southern Coke, No. 1 Soft	19.40 to 19.90
Southern Coke, No. 2 Soft	18.65 to 19.15

Philadelphia.—Pig Iron prices are certainly no lower, and the general trend appears to be toward higher figures. There is a firmer tone for long deliveries, and the quotations for the third quarter of the year are coming closer to those for the second quarter. Those who must secure Iron for prompt shipment are obliged to pay a sharp premium over ruling prices. No. 2 X Foundry has been sold at anywhere from $19.75 to $20.50, and even as high in some cases as $21. For shipment during the last half of the year $20 is about the extreme limit, and from that down to $19. For the last three or four months $18.50 to $18.75 might perhaps be done. The feeling is rather confident and sellers are not urging sales, but where customers insist on definite figures the above are about correct. Some makers decline to fix a price other than "price at time of delivery." The present prices would be about as follows for Philadelphia and nearby points:

	Deliveries to July.	Deliveries July to December.
No. 1 X Foundry	$20.50 to $21.50	$20.00 to $21.00
No. 2 X Foundry	19.75 to 20.50	18.50 to 19.00
No. 2, Plain	19.00 to 19.25	17.75 to 18.25

Pittsburgh.—Sales of Pig Iron are confined wholly to small lots and almost any price can be had for Iron for shipment prior to July. No. 2 Foundry for nearby shipment is quoted at $20.50 to $21, Pittsburgh. There is practically no Bessemer Iron to be had for delivery in the next two or three months.

Cincinnati.—Sales of Iron, either Northern or Southern, in this section have been limited in both size and number. Throughout the territory tributary to Cincinnati business has been exceedingly quiet, not on account of lack of customers, but because the Iron is not in sight with which to supply the demand for prompt delivery. There are some authorities here who think the market will not stop short of $18, Birmingham, for No. 2 Foundry, while others feel sure the market will go but little, if any, higher than it is to-day. Several sales of Southern No. 2 are reported for delivery east of Pittsburgh on the basis of $16, Birmingham. Northern Coke Irons are advancing and are booked to go still higher. We quote as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$18.00 to $18.50
Southern Coke, No. 2	17.50 to 18.00
Southern Coke, No. 3	17.00 to 17.50
Southern Coke, No. 4	16.50 to 17.00
Southern Coke, No. 1 Soft	18.00 to 18.50
Southern Coke, No. 2 Soft	17.50 to 18.00
Southern Coke, Gray Forge	16.50 to 17.00
Southern Coke, Mottled	11.00
Ohio Silvery, No. 1	20.60 to 21.10
Ohio Silvery, No. 2	20.10 to 20.60
Lake Superior Coke, No. 1	21.10 to 22.10
Lake Superior Coke, No. 2	20.10 to 21.10
Lake Superior Coke, No. 3	19.10 to 20.10

St. Louis.—Quietness has settled down upon the Pig Iron market at this point, and while quotations are being made the amount of material on hand of all grades is extremely light. The wide range of prices is apparent. Practically no quick delivery Iron is available here and the offerings for delivery several months hence are not of large volume. Sales and offerings of No. 2 Foundry come to our notice at the extreme price of $19.25, f.o.b. St. Louis. We quote for cash, f.o.b. St. Louis, as follows:

Southern, No. 1 Foundry	$16.00 to $19.00
Southern, No. 2 Foundry	15.25 to 18.25
Southern, No. 3 Foundry	14.75 to 17.75
Southern, No. 4 Foundry	14.25 to 17.25
No. 1 Soft	15.75 to 18.75
No. 2 Soft	15.25 to 18.75

CHICAGO REPORT.

Scrap Iron and Steel.—The market is quiet. The supply steadily grows larger, but prices are well held. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net tou.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipe and Boiler Tubes	12.00 to 12.50
Cast Borings	7.00 to 8.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Consumers are buying sparingly, and are forcing prices down on Old Copper and Brass. Other metals are a trifle stronger. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	10¾c.
Copper Bottoms	9¾c.
Copper Clips	10½c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	20 c.
Pewter, No. 1	17 c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—The quantity coming in is not as large, but the demand has not improved, and prices are unchanged. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	6¾c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6⅛c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Stocks are very large, and prices are inclined to weakness. Good Country Mixed Rags, Chicago delivery, 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—Buyers are covering their wants very freely at April prices, knowing that 10c. will be added May 1. A discount of 50c. is allowed on the following schedule for all coal shipped in April:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

There is a perceptible diminution in the volume of orders which is coming in to the manufacturers. This feature of the market probably finds sufficient explanation in the fact that it is now between seasons so far as the buying of the larger trade is concerned. Most of the wholesale merchants have covered their requirements for spring and summer goods, and while it is necessary for them to write many letters to hurry up shipments, they do not need to place many new orders. The matter of jobbing consolidation has also probably had some influence in diminishing the demand. The relief which thus comes to manufacturers is not unwelcome. Most of them are crowded with orders and are obliged to run their factories overtime. An opportunity to clear their order books would be regarded with satisfaction by most of them, provided the relaxing of the demand is not to be interpreted as indicating the diminishing of consumption. Of this, fortunately, there is little sign. The industrial activities of the country continue to give employment to labor and indicate almost universal prosperity. There is certainly an unusual amount of building in progress and projected for the remainder of the year. In many lines of goods there is a marked scarcity. Prices generally are firmly maintained and show no indications of weakness. Advances have of late been far more frequent than declines. In the present state of the market there are, however, few changes in either direction, prices generally being held steadily.

NOTES ON PRICES.

Plumbers' Supplies.—The demand for Plumbing Supplies keeps up in good volume, and prices throughout the list are strong with upward tendency in some lines. The volume of business so far this year has been considerably above the average, and the outlook favors an uninterrupted condition of prosperity in this branch of trade with a satisfactory margin of profits.

Wire Nails.—New business in Wire Nails continues large, while the output of the mills is not up to the requirements of the trade. The tone of the market is firm and complaints of irregularity in prices are few. The local demand for Wire Nails in New York continues satisfactory and jobbers are experiencing some difficulty in keeping their stocks well enough assorted to supply the needs of the trade. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—Cut Nails are in good demand, and the mills find some difficulty in turning out enough product to fill the requirements of the trade. Considerable difficulty is experienced by jobbers in keeping stocks well assorted. Small lots from store are quoted at $2.25 to $2.30 per keg.

White Lead.—Prospects for a large consumption of Lead are encouraging. The demand continues in good volume. Some competition is reported in White Lead in Oil, but retail quotations are unchanged at 6½ to 6¾ cents per pound.

Linseed Oil.—On April 17 prices of Linseed Oil were advanced 3 cents per gallon, City Raw in small lots being now quoted at 67 to 67½ cents. The demand is referred to as quite large at the advance. It is confined mainly to medium sized orders for consumption. The market is firm, with a possibility of a further advance in Oil in the near future.

Spirits Turpentine.—The price of Turpentine has fallen off during the week, owing to the light local demand. The demand is restricted to comparatively small lots by the painting trade. Small lots of Turpentine are quoted at 46 to 46½ cents per gallon. Advices from Savannah are to the effect that prices there have advanced ½ cent per gallon.

Coal Tar Products.—The plans of the new Coal Tar Products Association have been further extended by the organization of the territory embraced in the State of Maine. The care and detail with which it is covered indicates a definiteness of purpose that promises to regulate prices all over the country in this product as soon as the necessary details can be perfected. In Maine the trade is divided into ten sections, including sometimes one county and in other cases six counties, according to the volume of business, prices being quoted on both carloads and less than carloads, except as before in the case of Deadening Felt, Tin Caps, Nails and Rosin Sized Sheathing, which take the same rate in any quantity.

TIME was when we used to keep nothing but Galvanized and Black Iron and Tin Plate, but now we keep everything that a tinner or stoveman wants or ever will want. The reason is—we couldn't keep ourselves. We don't mean to brag, but our customers found us so accommodating, and that by dealing with us they saved so much money, that they ask us now to furnish everything they want. We will do the same for any tinner, stoveman or cornice maker in the country. Drop us a line. MEURER BROS. CO., Brooklyn, N. Y.

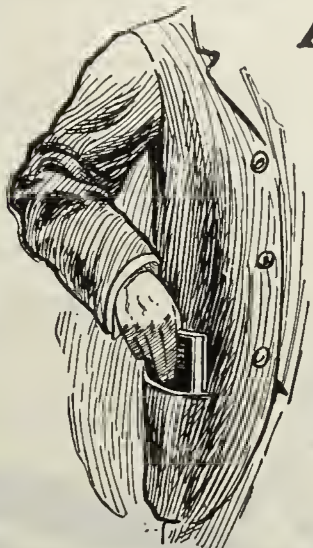
TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION



A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Ceiling Truths

TO **The Berger Manufacturing Company** belongs, exclusively, the honor of originating and placing upon the market complete classified designs of Metal Ceilings. Each classified design follows a definite and established form of architectural or decorative art, and each individual detail, whether of field plate, border, cove, filler, side wall, or wainscot is fully in accord with the artistic motive selected.

Now, that the meritorious features of

BERGER'S "Classik" CEILINGS

BERGER'S TRADE MARK METAL CEILINGS

have pushed them to the front and up-to-date merchants give them preference, it is evident to all observing readers that our predictions of the past are being verified, and competing manufacturers, recognizing the advantage of "**Berger's Classik Metal Ceilings,**" are bringing out a few more-or-less classical designs in a vain endeavor to follow our footsteps.

We will still be found heading the procession. Our line is not only by far the most complete and comprehensive but we are steadily adding to it, thus further increasing the already safe distance by which we lead.

If you want information about Metal Ceilings, ask us—we can tell you.

?

Do you handle Metal Ceilings? Are you satisfied with the line of Metal Ceilings you are handling at present? Let us demonstrate to you that our ceilings are superior in every way to all others. "CANTON METAL CEILINGS" are easily applied because they line up straight and regular, all parts match perfectly, joints fit tight and do not require putty to close cracks. All plates are resheared all sides and are interchangeable, which will save you time and trouble in erecting. Working drawing, showing design of plates, sent with every order. We solicit your business. Our mammoth new catalog for 1902 for the asking.

A. L. PEDERSEN & CO.
321 E. 35 ST. CHICAGO. U.S.A.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

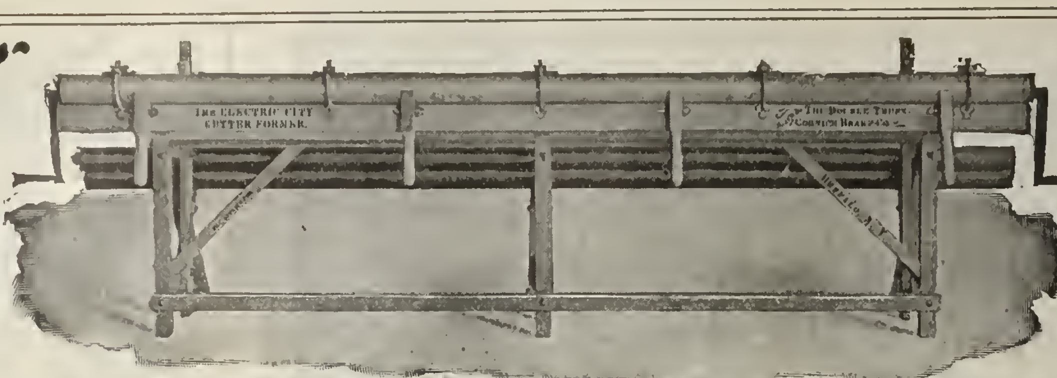
New In Principle.



THE ELECTRIC CITY GUTTER FORMER
THE DOUBLE TRUSS CORNICE BRAKE CO.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

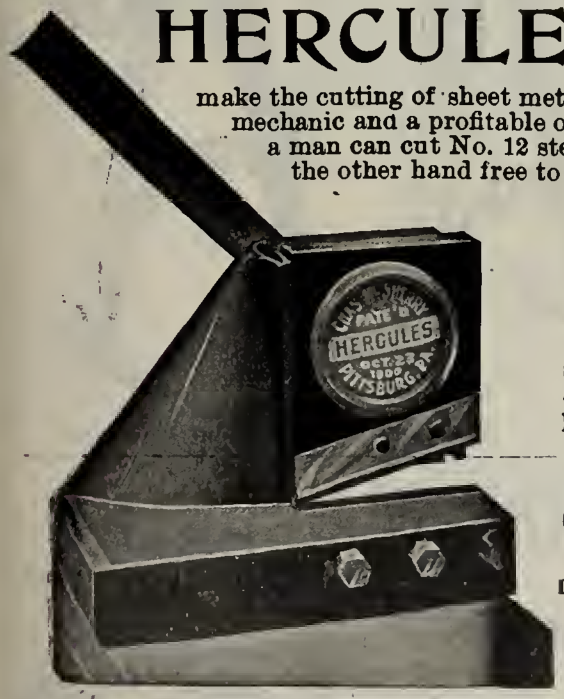
CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron.
97 inches long.

HERCULES SHEARS



make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

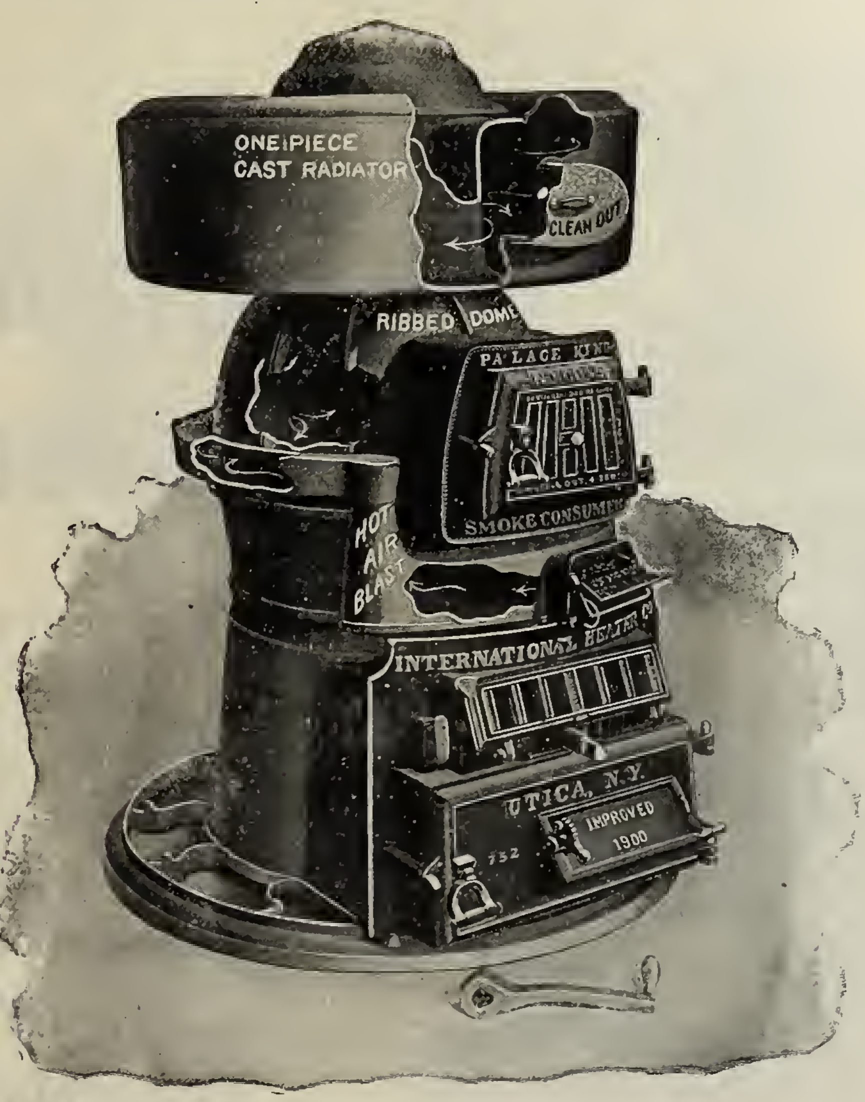
Hot Blast Smoke Consumer

WARM AIR FURNACE

For Soft Coal.



A Heavy, Substantial, all Cast Iron and Strictly High Grade Heater; Especially Constructed for Soft Coal Fuel.

THE HOT AIR BLAST APPLIANCE

Is so formed that the distribution of the hot air to the combustion chamber is equally divided at three points; at the back and on each side. This appliance embodies the important advantage of a hot air blast and also the very vital point of a durable construction. This question of durability of a hot blast appliance for soft coal fuel is one that has caused much annoyance and expense, and in this construction we have carefully provided for this important point. It is not a part of the combustion dome or fire-pot, insuring equal expansion and contraction. The air is discharged into the combustion chamber directly over the surface of the fire, and at a very high temperature, yet the construction is such that the combustion does not come in direct contact with it; the parts are allowed to expand and contract equally.

The Trade Mark Brother.

USED BY MILLIONS
ACORN
STOVES
AND
RANGES

ONCE upon a time there was a poor man who had three sons, all of whom became Stove Merchants; the first Diligently sought the Cheapest, but never found it and died poor; the second, desiring to please Everybody, sought Variety and bought Good Things from many foundries; his sales Dwindled and for many years he has voted the ticket: "Stove-Business-No-Good;" the third son sought a good Trade Mark Line and found it; he has stuck to it and advertised it for many years until he believes this Stove Trade Mark to be an important part of HIS capital in business; daily he is offered "better stoves" at "lower prices" and on "longer terms," but Strange to Tell he buys them not; he has a Wad of money, is President of the best bank in his town and could buy "U. S. Steel" or even spend a few days at a St. Louis Hotel.

Which think Ye the best Model? The Brother who believed in the Trade Mark or the two who sought to please Everybody?

STANTON H
MARTIN'S
DIRECT DRAFT
COAL AIR ENTRANCE BELOW SURFACE

LOUISVILLE, KY., April 5, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the Fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly,
ROBINSON-HUGHES & CO.

YOU NEED THEM.

Some one has said "We need all and all need us." We're sure you need

"GURNEY" HEATERS, Bright Idea, Doric and 400 Series,

if you would make the most of your business, because the "Gurney" possesses those attributes which appeal strongest to heater buyers; the ability to cut down the coal bill, to furnish the largest amount of heat possible from the fuel consumed as well as the ability to wear several years longer than other heaters.

You may not be able to get business with some heaters, but the dealers who handle the "Gurney" never have any trouble. Weigh this fact carefully, then write for particulars relative to an agency.

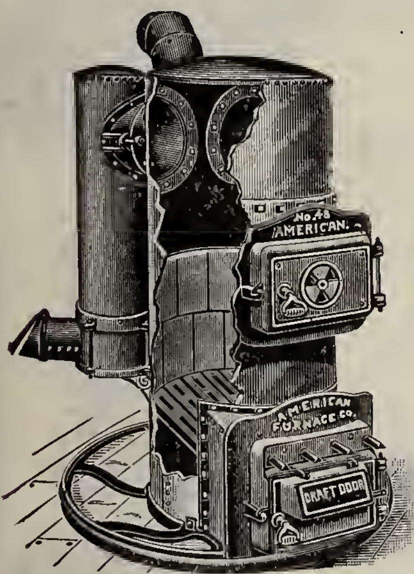
About Fire Pots.



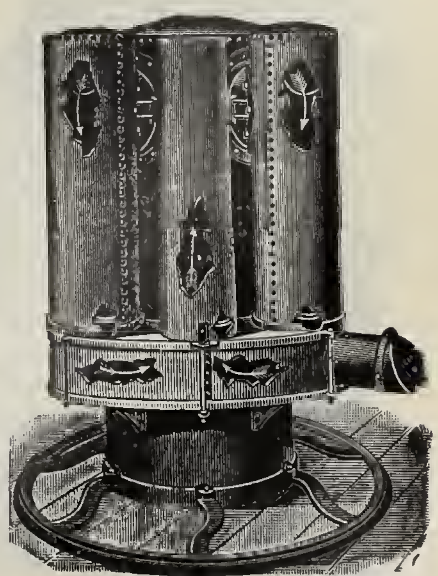
Burn Hard or Soft Coal, or Coke. Large Doors.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

The American Furnace Co.,
1911-13 PINE STREET, • ST. LOUIS, MO.



Large Radiators, easy to clean out.

Write for prices and secure the agency before the other fellow gets it.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.

For a swell job

You ought to know our line—many a dealer loses an opportunity to make a good profit because he knows only heating stoves and furnaces.

We can post you concerning steam and hot water heating, so you can get a share of what is due you.

KEWANEE BOILER COMPANY

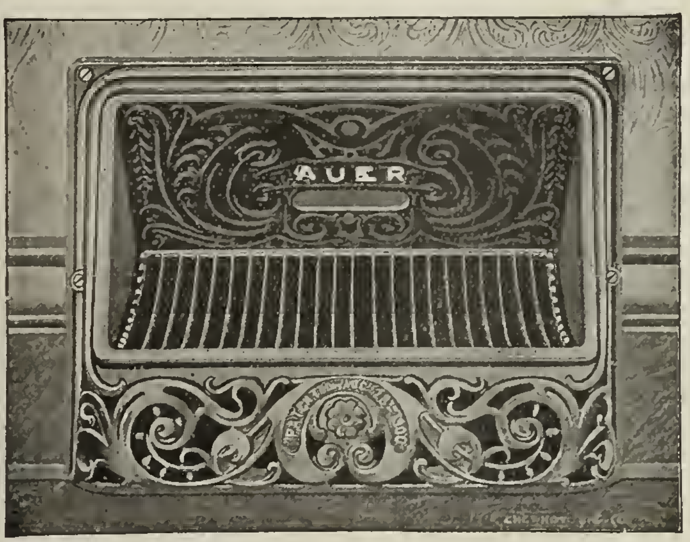
WINCHESTER

"After me, the doctor" seems to be the motto of some fitters. Most any radiation so long as it's iron, most any heater so long as it's cheap. The Doctor's services are called in. Better, by far, a "WINCHESTER" heater and no doctor's bills. Made for steam or water by SMITH & THAYER COMPANY, Boston, Mass., 106 Beekman St., New York.

HEATER.



When the Register is Open the Door Reflects the Air Across the Room.

Have You Registered

— FOR THE —

AUER SIDE WALL REGISTER

AND VENTILATOR?

HAS THE cheerful appearance of a grate or open fire place. No soiled walls. Ventilation and safety against fire are assured through the ventilator near the floor.

FOUL AIR is taken out instead of musty cellar air into the rooms.

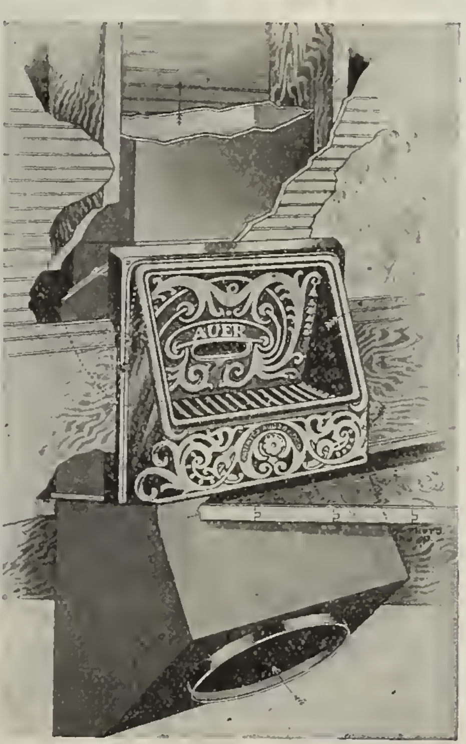
NO KNOBS or sharp corners projecting into the room.

NO GRILLE WORK to obstruct the air exit and accumulate dust.

INSTALLATION OF THE AUER REGISTER

Illustration showing Register heating one room on first floor with pipe connection for heating room on second floor, using one large instead of two small pipes from furnace.

Therefore less pipe obstruction in cellar, fewer elbows, angles, etc, and consequently less friction, less loss of heat from radiation, and less consumption of fuel. Insuring better circulation, warmer rooms and cooler cellars. Cost of installing furnace reduced by saving of pipes and labor.



THE AUER HAS SINGLE or DOUBLE REGISTER BOXES

Made of Sheet Steel and Japanned to prevent rusting. The future will demand a

WALL REGISTER.

If you want to control the furnace trade you will want the "Auer Register." It's the best as well as the cheapest. Write for 1902 price-list and discounts.

NOW IS THE TIME TO SECURE AGENCY.

HUNDREOS OF FURNACEMEN WRITE AS FOLLOWS:

L. MOBLO, the furnace man, Battle Creek, Mich., 1901, writes: "We are pushing the sale of your register, as your shipments will show. We have not sold a furnace job this year without putting in the AUER Registers. It has been a pleasure indeed to sell them, believing that my customers would receive more benefit from their use than from the old style floor registers. The convincing arguments combined with the true merits of the register in all cases sell them."

H. E. RIECK, Dayton, Ohio, says: "The Auer Register is bound to create a revolution in the register trade."

H. D. GREBE, Barrington, Ill., says: "If you don't sell my competitor these registers I am bound to get the furnacc jobs, as no other register will do."

THE BONNOT CO., Canton, Ohio, say: "We have secured contracts on the strength of having the Auer Register."

BRANDT BROS., Spokane, Wash., say: "We have used your register last season and are anxious this year to get exclusive agency for our city and surrounding territory."

W. W. VAN KIRK, Elizabeth, Pa, writes: "I have been using your register and think it is a peach and want the agency for that register. as my furnace trade this past year was large and all new houses that I heat will have Auer Registers every time."

When Register is Closed the Door Prevents the Accumulation of Dust and Lint.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house, chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

Page.

POINTS ON CHIMNEYS - 7–32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES - - - 33–35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY - - - - - 36–40
VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41–45
CONDENSATION IN STOVE PIPES - - - - - - 46, 47
SMOKE PIPE FOR WOOD FURNACES - - - - 48
REMEDYING DOWN DRAFT IN CHIMNEY - - - - 49–51
CONNECTED FLUES DESTROY DRAFT - - - - - - 52–55
FAILS TO BAKE ON BOTTOM 56–62

40 good Illustrations help to make the Text clear.

Price, Postpaid 25c.

WHY

THE TRIUMPH ADJUSTABLE STOVE PIPES TAKE THE LEAD:

They are easy to put together.
They are easy to take down.
They can be nested for storage.
They save freight.
They need no wiring.
They cannot telescope.
They are the only safe stove pipe.
They are what the people want.

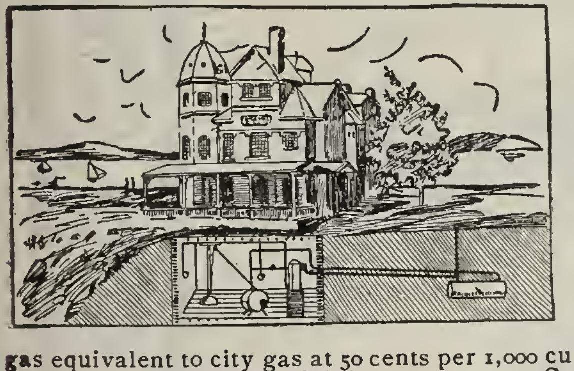
Anderson Coupling Co.
PORTLAND, CONN.



Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "*CONTRACT AND ESTIMATE RECORD BOOKS*" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, $1.50
500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, $2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, $0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, $1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

Index to Reading Matter……Page 58

The Building Situation.

Reports from all parts of the country indicate an active season in the various branches of the building trades. Throughout many sections projects are under way calling for the construction of large numbers of dwellings of moderate cost, while office buildings and business blocks are being erected or are contemplated to an extent which probably exceeds all previous records. Statistics compiled by *Construction News* show that in March, 1902, there were 8489 permits issued in twenty-three of the larger cities of the country. These improvements called for an expenditure of $32,387,240. In March, 1901, which was a month of marked activity in the building trade, the operations aggregated 7605 buildings at a cost of $29,796,320. This shows an increase of 884 permits for last March over the figures of the same month a year ago, and of $2,590,911 in their cost, or a general gain of 8 per cent. Here and there we hear of building operations being temporarily suspended by reason of higher prices of materials which enter into construction or by the scarcity of structural iron and steel. These deterrents, however, are likely to be only temporary, and projects which are now held in abeyance will doubtless be pushed to completion ere the close of the building season. Thus far the labor situation has developed no very serious aspects, although minor differences have arisen in many sections of the country, as is very often the case at this season of the year. In some instances the workmen have secured an advanced scale of wages, and in others the men are out on strike pending a settlement of their demands. Taking the country over, however, there is perhaps no more disturbance than is natural, considering the diversified interests, and the outlook is in no sense discouraging.

The Amalgamated Association.

As was quite generally expected, the convention of the Amalgamated Association at Wheeling adopted with practical unanimity the report of their Wage Scale Committee, thus stamping with their approval the action of President Shaffer and his associates in arranging the wage agreement with the American Sheet and Tin Plate companies and the Republic Iron & Steel Company. The ratification of the wage scale agreement for the coming year is a distinct victory for Shaffer and his policy, for it was he who originated the idea of signing the scale in advance and had the policy sanctioned by the Executive Board of the association. Much has been said and printed in the past few months about the strong opposition to President Shaffer and his conduct of association affairs that was declared to exist among the Amalgamated workmen, and it was even freely predicted that Mr. Shaffer's days as a leader were numbered. His re-election as president shows that the great majority of the members of the Amalgamated Association recognize his executive capacity and are prepared to support him in the leadership. While Mr. Shaffer's attitude during the great steel strike last year occasionally gave cause for sharp public criticism and some of his actions at times savored of the demagogue, his subsequent record indicates that he has taken to heart the lessons of that great struggle and embraced the more conservative policy of conciliation in preference to that of antagonism. It is a matter for congratulation, in the interests of the iron and steel trade, that the leaders of the Amalgamated Association have apparently grasped the idea that the true interests of both employers and employed lie rather in harmony than in conflict. The actions of the Amalgamated Association convention indicate that the workmen appreciate the advantages accruing from the adoption of a continuous wage scale in removing the risk of another prolonged strike, with its attendant suffering and irritation. Doubtless this aspect of the case appealed to the majority of the men with sufficient force to enable them to place in the background any personal feeling they may have entertained in regard to President Shaffer and his administration of the affairs of the association. It is to be hoped that the tin house workers at their convention, shortly to be held, will follow the example of the Amalgamated Association and agree to a continuance of the existing wage scale at the tin plate mills. This would remove every trace of labor uncertainty from the tin plate industry for the next twelve months.

Rated Capacity and Actual Product.

Some of the financial writers have made efforts recently to give numerical expression to the position which the United States Steel Corporation occupies as a producer of pig iron and steel as compared with the total output of the country. They have turned to the published statements of the capacity of the plants of the constituent companies, and have compared the figures thus reached with the total rated capacity of all the works in the United States. The method is plausible, but unfortunately is so inaccurate that the results of the comparison are worthless. To begin with, rated capacity is a very flexible quantity and frequently different operating officers in the same concern reach different figures. When inclined to be sanguine they are apt to take past records during brief periods as the basis for their estimate.

However, that is a minor matter. The grave mistake is that the capacity of all plants is put on a basis of equality, when as a matter of fact some of them can only run under extraordinary conditions. In other words, the modern works and the old cripples are all jumbled together. Quite a number of the latter, although carried along in the lists, are in such shape that even in booming times like these they are not running. It is quite evident that if there be segregated from the whole rated capacity one group of modern furnaces, say, like those of the constituent companies of the Steel Corporation, a comparison figured out on a percentage basis would lead to a serious underestimate of the power of the group. As a matter of fact, at the present time with all the blast furnaces running at full pressure the output of the Steel Corporation is probably close to 650,000 tons per month, out of a total production of coke and anthracite pig of 1,450,000 tons per month, or a little under 45 per cent.

Answering Letters.

It is becoming a matter of complaint in regard to American business men that they are apt to make long delay in replying to letters of inquiry and, in not a few cases, to leave such communications unanswered altogether. The complaint comes from abroad as well as from this country. So often has the matter come up of late that it would seem as though the practice of ignoring communications must be growing. It is a pity if this is really the case, for it argues not only a deplorable lack of courtesy, but also a carelessness and want of foresight that is inconsistent with the conduct of a well regulated and progressive business. Possibly the present prosperity is to a great extent accountable for this failure in politeness. Business is so active in many lines and men of affairs are so busy that, perhaps, they really have little time to bestow upon inquiries that may not be directly connected with present and more pressing interests. Consequently they are put aside and often forgotten. This, however, is short sighted policy. Business may be booming to-day and orders so plentiful that new ones are not desired, yet there may come a time in the future when business will be eagerly sought for, and then it may be found that would be customers who have been repelled by want of attention to their courteous inquiries in the boom time resent their treatment and, in their turn, repel the advances of those who want their custom. No business man can afford to neglect replying to his correspondents. Politeness pays in the long run, and the lack of this quality is a serious defect in any business. It will be found that the most successful and progressive concerns make it a scrupulous rule to answer every inquiry received without delay. No doubt much foreign trade has been lost to American houses through delay or neglect in answering inquiries.

Sanitary Instruction for Women.

In a recent issue of the *Pratt Institute Monthly*, the official publication of the Pratt Institute, of Brooklyn, N. Y., some interesting details are given regarding the work of the Department of Domestic Science, which is one of the important branches of that institution. This department was instituted about ten years ago. In the words of the last annual report of the director of the department, "It came into being to render potent in life the belief that malnutrition, disease, maladjustment of life, inefficient work, unrest, needless exhaustion and many similar human ills would be lessened, if not dissipated, were the principles of nutrition and other laws of life to be applied wisely to every day life." Acting on this idea, instruction was first given in practical house work, such as cooking, cleaning, serving, &c., and was subsequently extended to the natural science and art underlying such work. In connection with the more scientific part of the curriculum the pupils, who are, naturally, of the female sex, are given a course of instruction in chemistry, plumbing and heating by means of lectures given by the instructors in the trade school of the Pratt Institute. These lectures, which come under the subdivision of "household economics," embrace the underlying scientific principles connected with plumbing and instruction in methods conducive to the maintenance of sanitary conditions in the home. Some attention is also given to the sanitary requirements called for in the construction of a house. The principles of heat and their application to dwellings are also inculcated, thus giving the future housewife an intelligent idea of matters which are so important to the well being and comfort of the home. Probably this is the first instance in which such subjects as heating and plumbing have been taught to women in an institution of the character of the Pratt Institute. The utility of such instruction is obvious and this new departure may be followed with advantage in other similar educational institutions.

Conveniences of the Modern Office Building.

Frequent reference has been made to the conveniences of tenants found in some of the modern office buildings in New York City, but it is probable that readers of this journal do not fully realize the extent to which these features are carried at the present day. In one of the latest skyscrapers there is to be found a newsstand, tobacco counter, *café*, restaurant (with music at lunch), drug shop, press bureau, physicians, stenographers, barber (with his modern associates, the chiropodist and the manicurist), dentist, laundry agent, cable, telegraph, telephone, automobile information, theater agent, obituary bureau, notary public, &c. You can take an elevator to a man who will draw a will, or one who will arrange a funeral; without going from under your own roof you may liquidate a corporation or buy a locomotive. There are ten elevators in a bewildering row, which announce their coming by electric signals, some going 13 floors at a jump. Having all this so near is what spoils the New Yorker for any other city in the world—unless he is trying to get away from it.

A Gas Phenomenon.

The *Chronicle* of Houston, Texas, is responsible for the following:

> The drillers on the well being sunk near Big Hill, in Matagorda County, have struck a marvel in gas. In a letter written recently, a gentleman visiting that neighborhood says: "At a point nearly 900 feet deep they struck a gas formation with pressure much stronger than any well on Spindle Top or any other part of the coast country, and the drillers, not knowing what to expect, had the hole torn up and lost two holes just as they struck a rock that shows from rocks blown out a formation exactly like the cap rock at Spindle Top.
>
> "P. M. Lea of Lea & Son, Beaumont drillers, is drilling the well. He has made a permanent gas well out of the first well and so great is the pressure that he has piped the gas into the boiler as a settling tank to prevent getting grit in the engine, and then connects it direct with the engine and pumps, and runs the engine from direct pressure without steam or fire, and is now down 400 feet with the third well with the gas power. The pressure is not all turned on, yet the boiler blows off all the time at 110 pounds.
>
> "There is another phenomenon connected with the use of the gas. After it is used for power in the engine and pumps the escape pipe gives the appearance of pipes in an ice factory filled with ammonia. The ice freezes a quarter of an inch thick on the outside in contact with the atmosphere, and chunks of ice form on the inside from condensation of gas and blow out when they shut off the gas sufficient to push it out."

Another instance of the present day tendency toward arbitration and conciliation is presented in the fact that the American Newspaper Publishers' Association, embracing a large majority of the leading newspapers of the country, have executed agreements for industrial arbitration with the International Typographical Union and the International Printing Pressmen's and Assistants' Union, to continue in force for a period of five years from May 1, 1902.

THE NEW YORK STOVE TRADE.

Although the attention of the New York stove trade is largely fixed upon the rapidly approaching convention of the National Association of Stove Manufacturers the more important conditions of the trade have not been neglected. As has been previously indicated, the advance in molders' wages and in the price of iron, as well as the difficulty in securing the raw material, and the increased cost of all the supplies which enter into the construction of a stove have led to independent advances in the net cost of many goods. Some houses have issued circular letters calling attention to the conditions above referred to and stating that on May 1 there would be an advance of 5 per cent. on all their goods. The stove associations in other districts have already made such advances, but in the vicinity of New York, owing to the absence of any organization, such action could only be taken independently by different houses. If the conditions now prevailing continue it is probable that the example set by some of the New York manufacturers will be followed by the others.

PREPARING FOR THE STOVE CONVENTION.

Notwithstanding the efforts of the members of the National Association of Stove Manufacturers to make it perfectly clear that they invited themselves to New York for the convention this year, there has been a feeling of confidence on the part of the New York members that, at the proper time, steps would be taken to give the National Association evidence that their visit to New York was appreciated as an honor and that courtesies would be extended that would make a pleasant diversion from the more serious matters which would engross the attention of the delegates. To this end a local committee has been appointed and preparations are well under way for an entertainment that will be worthy of the New Yorkers and tend to the enjoyment of their guests.

* * *

It is customary, wherever the National Association of Stove Manufacturers meet, for the local members to put their best foot foremost in everything that will come under the eye of the visitors. This is particularly to be noticed in the Beekman and Water street district of New York at the present time. The Boynton Furnace Company have newly painted the samples of the Boynton furnace in front of their establishment, at 207-209 Water street, besides freshening up the interior of the store. Directly across the street, at 208 Water street, the Graff Furnace Company have given a new coat of paint to the sample of the Faultless furnace which has become a landmark in that district. A little further up the same thoroughfare Floyd, Wells & Co. of Royersford, Pa., have flung out a new gilt sign at their branch office, at No. 210. Just above them Eugene Munsell & Co., not to be outdone by their neighbors, are treating the front of their building to a new coat of paint.

* * *

Around the corner, J. M. Litchfield is arranging the goods of the Penn Stove Works of Reading, Pa., so as to leave none of their attractions hidden. At 284 Pearl street, A. L. Canfield has the Beaver line of the Danville Stove & Mfg. Company of Danville, Pa., attractively displayed, and Isaac A. Sheppard & Co. have also freshened up their sample room. The Syracuse Stove Works are making an attractive display of their line of registers, in addition to the Welcome stoves, ranges and furnaces. At the Union Stove Works, in addition to their line of coal goods, a very attractive show is made of the company's extensive line of gas cooking and heating apparatus. Those of the out of town members of the association who find their way from the Waldorf-Astoria to the stove district of New York City will notice that their visit has not been unexpected.

THE CLEVELAND FOUNDRY COMPANY, Cleveland, Ohio, are directing the attention of the trade to their Sterling-Puritan Wickless Blue Flame Oil Cooking Stoves by means of a 20-page pamphlet which they have just issued. The merits of the goods are set forth in a way to interest the dealer and illustrations are presented showing the styles in which the goods are offered. In addition to Stoves, attention is given to Ovens and Repairs, and also to the Puritan Oil Heater, equipped with a wick stop which is claimed to prevent smoking.

QUESTIONS ON FURNACE CONSTRUCTION.

BY D. Y. N.

Having a few ideas on furnace setting and hot air heating, I present them with the hope that furnace manufacturers and furnacemen will comment upon them. In setting and operating furnaces in Iowa it is quite common practice to rotate the air. The main object is to get as complete a circulation from the furnace to the room and from the room back to the furnace as is possible. Now what I would like to ask from those who make a study of furnace construction is this: Could not a furnace be so constructed as to take the air that is necessary to promote combustion from the cold air pit under the furnace, instead of taking the air through the draft slide in the ash pit door and from the room in which the furnace sets? Then, for the purpose of checking the draft, could not the air also be taken from the cold air duct? This would mean, when in addition to the main cold air duct an inside air duct was provided, the foul air could be exhausted from the building and substantial ventilation be effected.

I think that if a furnace could be built somewhat along these lines it would greatly facilitate the heating of the room and the circulation of air. When the check draft was open the chimney would draw cold air either from out of doors or from the house, and, as it passed out of the top of the chimney, it would help the ventilation of the building, and in no way interfere with the successful operation of the furnace. I am not a furnace builder, although I have spent many years in setting furnaces and closely observing their construction and operation, and think that something along the lines suggested would be beneficial. I hope that furnace manufacturers and all who are interested in furnace work will think over my suggestion, and am satisfied that *The Metal Worker* will grant the space necessary for pointing out the merits or demerits of such an apparatus as that suggested.

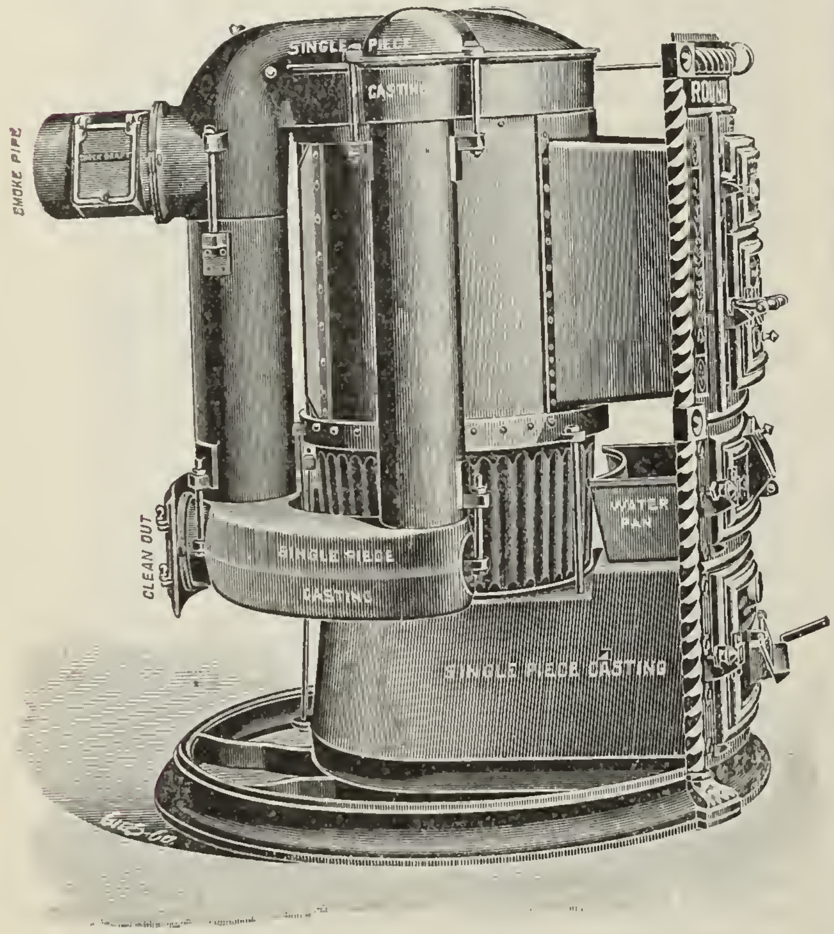
Cleveland Co-operative Stove Company.

The Cleveland Co-operative Stove Company, Cleveland, Ohio, have just issued, in combination with the Chattanooga Stove Company of Chattanooga, Tenn., their thirty-fourth annual catalogue of the stoves, ranges and heaters which they manufacture. A careful inspection of its pages shows that the manufacturers have eliminated a number of old patterns and added several new ones, embodying the latest features, the object being "to make the best goods possible for the least money." The volume is made up of 136 pages, profusely illustrated and bound in covers of attractive design. The goods shown are for the season of 1902-1903, and embody lines of such variety as to meet all reasonable requirements.

The leading place is given to the Royal Grand steel range, which is intended for using hard coal. The body is made of heavy planished steel, the bottom plates are double and lined with asbestos, thus preventing radiation from the oven to the floor; the fire box has sectional cast iron linings, the top is sectional, the flues and the end of the fire box are lined with heavy asbestos, and the top warming closet has a swell front door. Other members of this general class are the New Grand and the Royal Rival, both of which are of neat exterior and embody the modern improvements. A long line of cast cooks and ranges follows, some being designed for using coal or wood as a fuel and others intended for burning wood only. The leading place among the heaters is given to the Royal Ruby square base burner, made in three sizes, for hard coal or coke. The Royal Opal, another member of this class, is also made in three sizes, and is referred to as a high-class heater at a moderate price. A varied assortment of Oak, Franklin, Cottage Parlor, Globe, Cannon, laundry and air tight stoves are also presented. The catalogue concludes with a comprehensive index.

THE ROUND OAK FURNACE.

When the Estate of P. D. Beckwith decided to engage in the manufacture of a furnace they determined that it should be as perfect a piece of heating apparatus as modern progress demanded. They had acquired a reputation for their Round Oak stoves, which had made the town of Dowagiac, Mich., known throughout the length and breadth of the United States. The Round Oak stove had been the exclusive product of their works from the beginning, and to engage in a new line was a matter of importance to them. The company spent several years in perfecting their Round Oak furnace before they presented it to the trade, the experiments covering heating surface, fuel economy, durability and other details of construction to eliminate weak features. A recent visit to Dowagiac by a representative of *The Metal Worker* developed many points of interest in connection with the manufacture of this furnace and its special features which are herewith presented.



The Round Oak Furnace.—Fig. 1.—View of Furnace without Casing.

The design of this furnace, as shown in Fig. 1, requires modern foundry facilities and also necessitates the employment of special machinery in the mounting and fitting shop. The construction calls for several large castings, which are not only heavy but are difficult to make. They comprise the large one-piece top, the one-piece bottom circular radiator and the one-piece ash pit.

The one-piece top was adopted to overcome upward expansion. The three flues are suspended from it by means of lugs and bolts, as shown in Fig. 1, cup joints being utilized for making the connection gas tight. This casting weighs 265 pounds for the largest size furnace. Large flasks are required in molding these castings and the foundry is fitted with cranes for handling these flasks and the castings with convenience. A view of this operation is given in Fig. 2. The one-piece bottom radiator is a difficult casting, forming a tubular semicircle of irregular shape. It is attached to the bottom of the three flues, also by means of lugs and bolts, as shown in Fig. 1, cup joints being used to make the connections gas tight. The one-piece ash pit is also shown in Fig. 1.

Another feature of the furnace is the casting of door frames on the ash pit and the feed door extension. This prevents any chance of forcing gas up back of the door frames. Fig. 3 shows one of these castings being taken from the sand in the foundry.

The body of the furnace is constructed of No. 6 sheet steel to insure a durable body. It is riveted to the cast top, the two parts overlapping liberally, and the joint thus made being perfectly gas and air tight, special machines being used for this work.

Fig. 4 shows one of the expert furnace mounters completing the inspection of a furnace. Every furnace is said to be fitted so perfectly air tight that it will hold fire 24 hours without the use of the check draft in the pipe collar. The ash pit door is ground on and fitted so tight that if completely closed it will extinguish a hard coal fire. The large feed doors are also ground and fitted perfectly tight. Each furnace is completely mounted in the shop, then thoroughly inspected in the same manner as a Round Oak stove, after which it is taken apart for shipment.

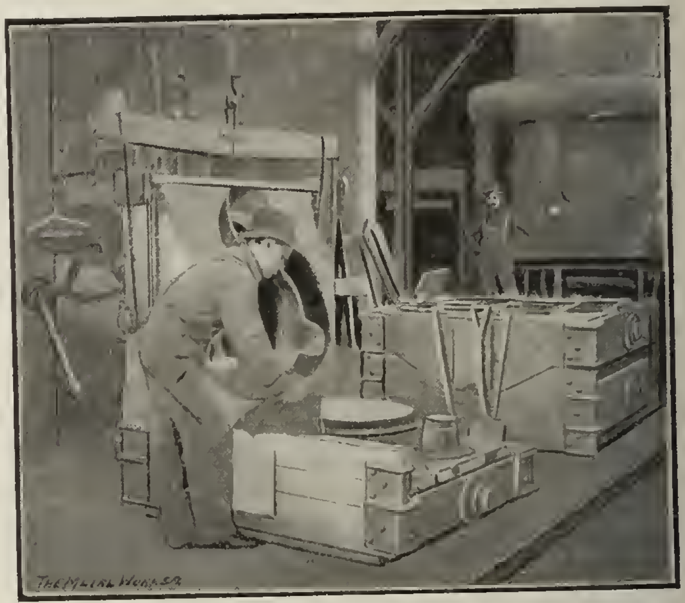


Fig. 2.—Equipment for Making Heavy Castings.

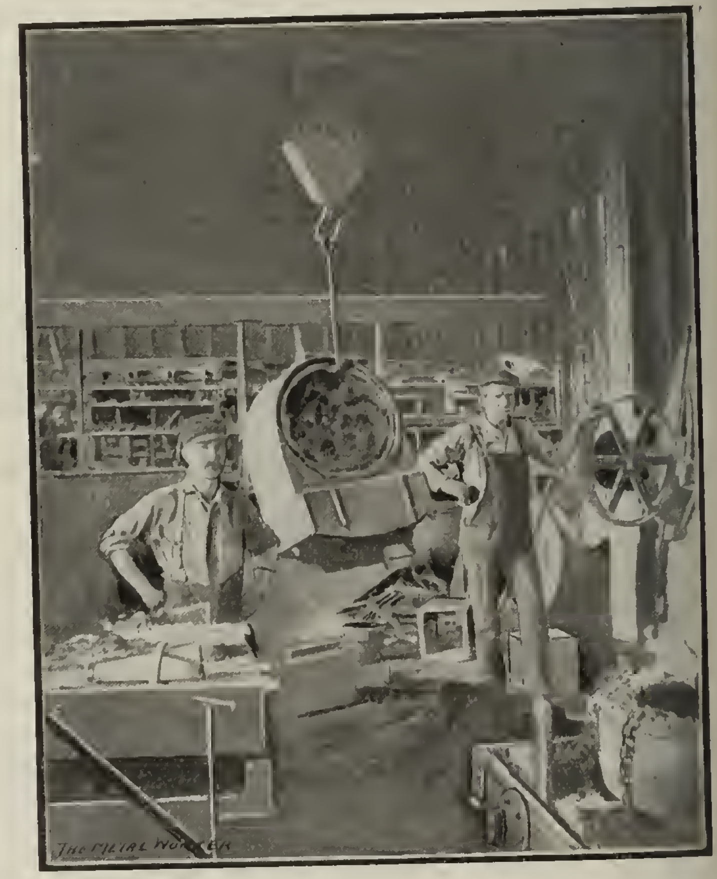

Fig. 3.—Removing the Ash Pit from the Sand.

This furnace is presented to the trade as one of the most powerful heaters manufactured. The heating surface includes not only the fire pot, body and top, but also the return flues and radiator. The three return flues connect the top with the radiator, making a long fire travel before the gases reach the smoke outlet. Steel plate was expressly selected for the body because of its quick heat transmitting quality.

The triangular grate cleans the entire bottom of the fire alike, is easy to operate, and can be removed and replaced in a few moments through the ash pit door. The furnace is fitted with feed doors of a size suitable for the use of large chunks of coal or wood. It is designed to burn either hard or soft coal, coke or wood. A special hot blast attachment has been invented and is applied to this furnace, which is used for soft coal principally. This attachment takes the air in through the feed door, passes it around behind heavy cast iron sections, becoming intensely heated *en route*, to the openings in each side of the combustion chamber, whence it is discharged at the surface of the fire igniting and consuming the gases and generating heat which would otherwise be lost. This hot blast can be replaced in a few minutes if any portion of it should burn out.

The Round Oak furnace is built in 12 different sizes, which represent each a different capacity in a regular high and a low series which is adapted to low cellars. A water heater is furnished so that all sizes except the two smallest can be used as combination warm air and hot water furnaces, giving a still wider range of usefulness.

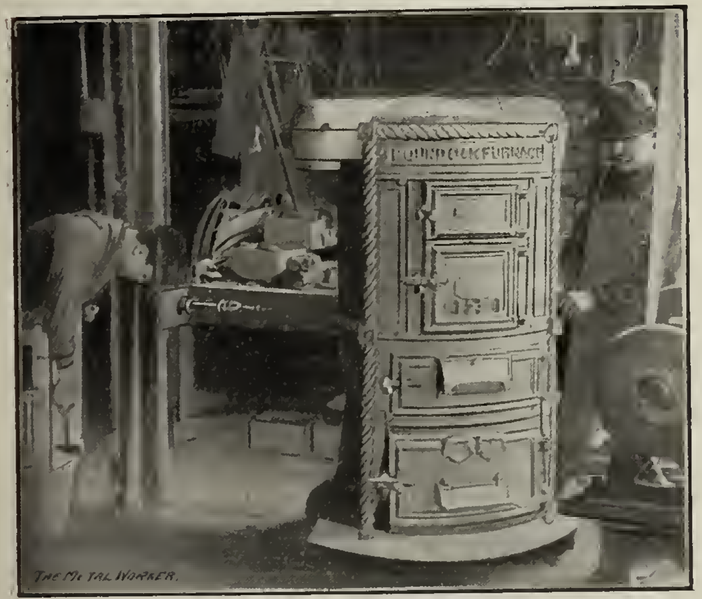

Fig. 4.—A View in the Mounting Room.

Quality has been the aim from the beginning in producing the Round Oak furnace. The manufacturers apply their experience in building and selling Round Oak stoves to their furnace trade. Their customers are assured that it is economy to buy and handle a good furnace instead of a cheap one, making quality the feature instead of the price. That this is demonstrated to be a winning point is shown by the increase in sales. Up to this time the sales of Round Oak furnaces are double those of last year. The manufacturers of the Round Oak furnace make the strong point that they teach their customers the furnace trade. Those who are not familiar with furnace work are in this way enabled to take up the sale of furnaces and thus secure an additional source of profit.

The H. Adler Company's Extension.

The H. Adler Company of Pittsburgh, manufacturers of gas and gasoline stoves and ranges, have bought a site of 4 acres of land at Carnegie, Pa., near Pittsburgh, on which they will build a modern plant for the manufacture of their goods. There will be seven buildings, which will cost, with their equipment, about $75,000. These will be a foundry, 70 x 150 feet; a mounting room, 40 x 200 feet; a finishing room, 30 x 120 feet; a store and stock room, 50 x 200 feet; an enameling room, 50 x 100 feet; a press room, 30 x 100 feet, and an engine house. The press room will be of brick and steel construction, two stories high, and will contain the offices of the company. The other buildings will be one-story structures and will be iron clad. A gas engine of 100 horse-power is to furnish power. The work of excavating will begin May 15, and the company expect to move in by December 1. The present quarters at 241 First avenue, Pittsburgh, will be retained as the main offices and for a warehouse. The H. Adler Company have been very much cramped for room for some time, having enjoyed a very large trade in their line of gas appliances, and it became absolutely necessary for the firm to greatly enlarge facilities for the manufacture of their goods.

Death of Eben W. Fiske.

The trade will regret to learn of the death of Eben Winslow Fiske, secretary of the Smith & Anthony Company, Boston, Mass., which occurred on April 29, at his residence, 46 Lyman street, Waltham, Mass. Mr. Fiske was born in Waltham on May 22, 1860. He entered the employ of the Smith & Anthony Company as a clerk in 1879, and was rapidly advanced from one position to another, until he was made secretary of the company. His entire time was devoted to the conduct of the affairs of the company, and he was held in high esteem, both by his associates in the management and by those who worked under him, down to the humblest employee. Mr. Fiske's business qualifications, integrity and kindness of heart, combined with sound judgment, earned for him the friendship and respect of all the customers and friends of the concern. The funeral was held at his late residence in Waltham on Thursday afternoon, May 1, and was attended by a large number of his friends and business associates.

Peninsular Gas Ranges.

The Peninsular Stove Company, Detroit, Mich., have issued and are distributing among the trade an eight-page folder calling attention to the Peninsular gas ranges, which is especially timely at this season of the year. The material used in the construction of this range is polished steel, which requires no blacking, the finish, it is claimed, being such that it will always retain its luster and present an attractive appearance. There is an asbestos lining around the entire body of the range, including top and bottom, which causes the heat to be retained within, thus quickening the baking process while effecting a saving in fuel. The stove is provided with four large star shaped portable burners and one simmering burner, one of them being of double capacity. There are also two powerful burners for the oven with double rows of gas jets, giving a quick and uniform heat at top and bottom of the oven at the same time. The entire oven is portable, so that all parts of it can be taken out without removing any bolts, and the oven bottom is double, so as to equalize the heat. The asbestos lined oven top is made of steel, extra well galvanized, and the oven doors are balanced so as to open easily, quietly and flush with the oven bottom, thus forming a strong shelf when open. All burners lift off, including the oven burners, thus making it easy to keep everything clean. The drip pan is made of one piece of steel with extra heavy tinned wire broiling and oven racks.

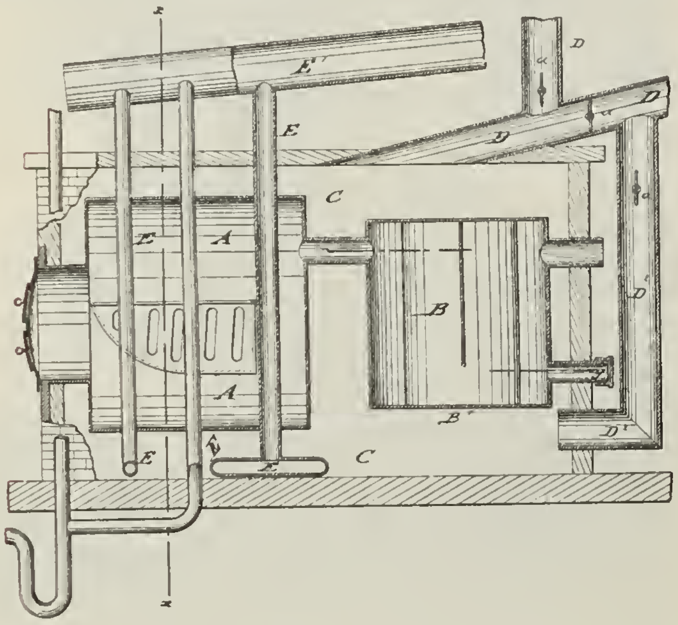
The circular also calls attention to the Active Peninsular gas range, which can be used in summer for gas, and in winter coal or 24-inch wood can be used as a fuel, as circumstances require. This combination range is made of the same materials as the gas range already described and is offered in a number of styles and sizes. The folder gives a great deal of interesting information in connection with these goods and in addition to the descriptive text there are prices, dimensions and sizes in which the ranges are offered.

The Lexington Stove Works, Lexington, W. Va., is being put in condition for the resumption of operations at an early date. The capacity of the plant will be about 30 Stoves a day, and 40 men will be employed. The company have appointed the Hardware firm of Brock & Co., Lexington, as sole distributers of their products for that city and vicinity. J. J. McGuff, an experienced Stove man, will take charge of this department of Brock & Co.'s business.

AN OLD COMBINATION HEATER AND VENTILATOR.

Evidently the discussion of the "rotary system" of hot air furnace heating is having the result sought for by the original contributor—that is, the study of what has been done in the past for the purpose of future guidance. We have been favored by W. R. Macdonald of Pittsburgh, Pa., with the following letter, together with a copy of a patent granted to him in 1878, a portion of which we reproduce with a cut showing the combined heater and ventilator patented by Mr. Macdonald. The letter is as follows:

"For the consideration of the furnacemen now in travail with the 'rotary system,' I send herewith a copy of an expired patent for a combined heater and ventilator. It is, of course, old fashioned, but where is the modern heater for the same work? The salient points are ventilating flues, or ducts, that are connected with the apartments, seat vents, &c., to be ventilated, for collecting the foul air through the heater, by means of small flues into a large collecting and discharge foul air flue above the heater, as shown. It will be observed that it differs from the 'rotary system,' inasmuch as the air that is taken down from the rooms is not returned to the rooms to be used over again, but is discharged into an upcast flue. This being a gift horse, I hope the critics will receive him kindly as an antique."



An Old Combination Heater and Ventilator.

The patent papers show the cut presented herewith and state that the invention has for its object the furnishing of a combined heating and ventilating apparatus that may be used either wholly as a heater, or as a heater and ventilator, or for summer use as a ventilator alone, the apparatus supplying heat in the customary manner, but throwing off the vitiated foul air from apartments, closets, soil pipes, &c., and conducting the foul air away and supplying in its place pure air. The main heater A consists of an oval cylinder placed horizontally, inclosing the fire chamber, with an outlet for the products of combustion to pass into an annular drum in the rear, thus affording considerable surface for heating the air. The hot air for warming purposes is gathered in the large hot air flue D, from which branches are taken to the various apartments to be heated. A branch from this heating flue is carried down from the top of the heater to the bottom of the heating chamber, and both pipes are fitted with tight dampers, so that the effect of the modern mixing chamber can be secured, or, by closing the damper in the heating flue and opening the damper in the return flue D^2, air can be exhausted from the rooms connected with the heating flue and these rooms ventilated. The main exhaust ventilating feature consists of bringing small pipes back from the various rooms heated to the bottom of the air heating chamber, and passing these small pipes up through the chamber and connecting them with one large exhaust ventilating flue E^1, this main flue to be carried to some convenient point for discharge and so protected that back draft will not interfere with its operation.

An apparatus of this type was exhibited at the Pittsburgh Exposition in 1882 and received first premium for the best ventilating attachment to a heating apparatus awarded by the Pennsylvania State Agricultural Society. Mr. Macdonald states that a number of such apparatus were installed in St. Louis and gave such satisfaction that testimonial letters were furnished, but that as the average layman of that date did not appreciate ventilation the business was all the way up hill and the effort to sell the apparatus was discontinued.

THE "ROTARY SYSTEM" OF AIR MOVEMENT.

BY O. K.

"Iowa" seems to have stirred up some thought on the heating question. I notice the contributors to *The Metal Worker* have not read "Iowa's" article in the issue of March 8 very carefully. Your Minneapolis correspondent has lost his breath in driving at things "Iowa" never dreamed of in his article as I understand it. The writer (so he says in his article) has used stove and steam heat in his time. Where did he get his fresh air with these systems? He didn't have any, according to his theory. He thinks fresh air can only get into a house through a wooden box or a pipe. He thinks five people "destroy large quantities of oxygen."

I had a house facing west several years ago, with a big brass key for the front door. The keyhole in cold weather let in more cold air than five persons could use. The fact that under the old style furnace system the same provision was made for fresh air for 25 persons as for one shows the humbug of the thing. It has been just as "Iowa" says. The cold air box was not for ventilation, but because the furnacemen did not know of any other way to get their heat into the house. This "rotary air movement," I believe, has come to stay. It knocks out the old nonsense and people see it. Hence its rapid adoption in Iowa. This "rotary air movement" does not interfere with any other method of ventilation.

Again, "Minnesota" is afraid of that 6 gallons of water. He doesn't seem to know that furnacemen and all other heating men have been hunting for years for a practical method for giving moisture to the air of our houses and have failed. "Iowa" has given us a practical method. The amount can be controlled and regulated to any degree. If a man don't like 6 gallons he can have less, but 6 gallons of water used in 24 hours in an ordinary house in cold weather would only give the air a very pleasant condition—about like the air of a nice June day. "Minnesota" going over a house, sprinkling a gallon of water in each room, would find in the course of an hour or so that the hungry dry air of his dry air furnace had licked up all this water, and that the air had been greatly improved in quality. That would only be his bungling way of getting at what "Iowa" gets at automatically in the best way imaginable, and only gives the air what it requires.

When Dr. Williston, medical adviser of the State Board of Health of Kansas, pronounced "Iowa's" method of softening the air as "having solved the problem of sanitary heating," "Minnesota" and all other heating men should give heed. If "Minnesota" will turn to the March 8 number of *The Metal Worker* and read over again "Iowa's" article until he understands it, he will laugh himself at the mess of blunders he has made in the last 30 lines of his article.

What most of us are after is the truth, and to get rid of any errors in our common methods of heating. "Iowa" has given us a whole lot of ideas to think of. He has hit our old ideas some hard knocks. If we undertake to kick back we need to be careful that our force is not spent in defending ignorance and wrong methods.

It is reported that a plant for the manufacture of Gas Stoves will be erected at Kankakee, Ill.

ODD PLATES.

The H. Adler Company, 241 First avenue, Pittsburgh, Pa., are sending out a neat blotter calling attention to their Acme Gas Ranges, Ovens, Cookers and Hot Plates. The company are prepared to send their catalogue No. 35 covering this line of goods to any who are interested, on receipt of application.

The Globe Stove & Range Company, Kokomo, Ind., were serious sufferers by a fire which broke out in their works on the 13th ult. The engine room, wood pattern shop and range mounting room were destroyed. The loss approximates $24,000, which is fully covered by insurance. The company began to rebuild immediately after the fire and expect to have the plant in good running condition very speedily. Their warehouse, which was full of manufactured goods, was untouched, consequently the company are in position to give all orders prompt attention.

The Mosher Heating Company of West Troy, N. Y., are sending to the trade a large mailing card showing a broken view of Mosher's K-loric Generator Warm Fresh Air Furnace. The construction provides a large heating surface and an indirect draft, and the principal feature is a hollow bulb hanging in the center of the combustion chamber, the circulation of air through which is claimed to add substantially to the heating capacity.

The Meyer Furnace Company, Peoria, Ill., are placing upon the market this season a new line of Acorn Wood Furnaces, in two sizes, and the manufacturers claim special merits and selling advantages for these goods. The well-known Weir Furnaces continue in popular favor, and in order to properly handle the increasing business the company have doubled the size of their plant this spring, adding new machinery and other equipment. The Handy Furnace Pipe, manufactured by F. Meyer & Brother Company, is still another product of this plant which is in large and increasing demand. The trade are invited to look into the merits of these products.

The Co-operative Stove Company, Bloomington, Ill., are calling attention to the new designs and features of their Stoves and Ranges offered this season. They say the outlook for trade is very favorable. They have recently added a new equipment of machinery, in order to enable them to better care for the enlarging demand.

The Western Stove Works, Peoria, Ill., have added to their line for this season a new Steel Cook, for which they claim special merit in the construction and attractiveness of design. Their well-known line of Pleasant Home Stoves and Ranges continue to make good in the home the full significance of their title. In order to meet the growing demand for these goods a large addition to the company's present factory has been built and equipped with new machinery.

William Highton & Sons, manufacturers of Hot Air Registers, Ventilators and Borders, with factory at Nashua, N. H., have recently removed their Boston office to 26 Union street, which is in the heart of the Stove district. The Boston store is in charge of Benjamin G. Lamont and occupies two floors, 30 x 75 feet. A large and varied stock of goods is carried there, sufficient to meet all the demands of the trade, and samples of the company's entire line are attractively displayed. These include many styles and finishes. They have recently added a number of new finishes, including oxidized copper, antique, frosted silver, oxidized silver, chocolate, old copper, nickeled and copper plated and aluminum.

The Eclipse Gas Stove Company, Rockford, Ill., of whom George B. Roper is the president and manager, have issued an illustrated catalogue for 1902 descriptive of their Eclipse Gas Stoves, Water Heaters, Broilers, Ovens and special appliances. The catalogue is of 48 pages, tastefully arranged and well printed, and illustrated with half-tone engravings of the company's varied line of goods. It opens with a complete description of the Eclipse Gas Stoves and details regarding their especially meritorious features, including the auxiliary oven, upright broiler and water heater.

The Portsmouth Stove & Range Company, Portsmouth, Ohio, manufacturers of the Model Steel Ranges, Queen Stoves and Hollow Ware, send out, under date of April 23, a large postal card advising the trade that the increased cost of manufacturing their product has compelled them to withdraw prices on their goods. The company will quote present prices on application.

In bringing to the attention of the trade the Quick Meal Steel Ranges for this season the Ringen Stove Company division of the American Stove Company, St. Louis, Mo., direct special attention to new features of construction, which will be found of great advantage. It is announced that the main points of improvement in these goods will be in the matter of a new shelf and closet, which will be something entirely novel, and, it is said by the manufacturers, will prove a revelation to the dealers.

W. G. McPherson of Portland, Ore., who is in the East in the interest of his large heating and ventilating business, was a visitor at *The Metal Worker* office this week.

F. E. Myers & Bro.

The marked growth of the business of F. E. Myers & Bro., Ashland, Ohio, manufacturers of the Myers pumps, hay tools, Stayon door hangers, &c., has compelled this firm within the last three years to add to their already large plant two three-story additions, 50 x 150 feet. A new power plant was also added during the last year, so that the plant is now driven entirely by electricity. Their office facilities had also become very inadequate. Recent changes have lately transformed the entire lower floor of one of the main wings, 50 x 150 feet, into splendidly arranged and equipped offices. The offices are fitted up in luxurious style and provided with all the modern conveniences. Separate communicating offices for the use of the heads of the firm and managers of departments give privacy and at the same time render communication between departments easy. All the offices have an abundance of light, are well ventilated and everything possible has been done for the comfort of the large number of clerks employed.

Special F Victor Sifter.

National Mfg. Company, Worcester, Mass., New York office 103 Chambers street, are making the Special F Victor rotary flour sifter, here shown. It is about double the weight of the ordinary pattern, has a beveled tin agitator, is nickeled and polished, and has a mahogany finished wood handle. This quality of sifter has been put out in response to a demand for a better grade of thoroughly serviceable goods than was afforded by the regular line.

Special F Victor Rotary Sifter.

The Michigan Barrel Company, Grand Rapids, Mich., are sending out a new catalogue of the Yukon, Economic and Chilkoot Refrigerators. The Yukon has 3 inches of insulation and eight walls. The Economic is solid ash, with both zinc lined and white enamel provision chambers and eight walls. The Chilkoot Refrigerators are offered to meet the demand for a moderate priced article, and are made of hard wood with golden oak finish and insulated with charcoal sheathing.

THE NEW YORK STATE ASSOCIATION OF RETAIL HARDWARE DEALERS.

The meeting which was held in the Yates Hotel, Syracuse, N. Y., on Monday and Tuesday of this week for the purpose of organizing an association of retail hardware dealers in New York State was in all respects successful. The attendance was exceptionally large and the enthusiasm shown promises well for the success of the association. The meeting was called to order on Monday afternoon by John R. Taylor of Little Falls, who nominated as temporary chairman O. D. Towne of Saratoga Springs, who made a brief address outlining the object of the meeting. The following committees were appointed:

Constitution and By-Laws: John T. Sage, Irving Van Vorls, W. D. Hallowell.
Nominations: F. W. Gardner, Thomas Maloney, Geo. B. Allen.
Press: J. B. Foley, Allen S. Matthews, Mr. Goodnoe.

The chairman then introduced Secretary M. L. Corey of the National Retail Hardware Dealers' Association, who made a very interesting and effective address, referring to the lines on which the association could most satisfactorily do its work. Addresses were also made by John R. Taylor, A. S. Matthews, H. D. Howell, J. H. Callahan and others.

The session on Tuesday morning was entirely devoted to the consideration of the constitution and by-laws, and the report of the Committee on Constitution and By-Laws was adopted. It was decided that the title of the association should be the New York State Association of Hardware Dealers. The resolutions adopted were as follows:

Whereas, Some manufacturers and wholesale dealers in general Hardware, Stoves, Tinware and kindred lines persist in selling their lines through prejudicial channels to our injury and detriment, placing us toward our customers in the light of extortioners, causing endless trouble, and

Whereas, The system of protecting us from this wrong is ineffective, it is absolutely necessary to perfect such a system by united action, which will remove these evils from which we have suffered for years. Therefore, be it

Resolved, That the members of this association confine the purchase of Hardware, Stoves, Tinware and kindred lines, as far as practicable, to manufacturers and wholesale dealers who sell goods to firms that are regularly engaged in the retail Hardware business, as defined in these resolutions.

Resolved, That it is the sense of this association that the interpretation of the term "retail Hardware dealer," as set forth in the above resolution, to entitle him to purchase Hardware, Tinware and kindred lines, be construed to mean any person having an established place of business and carrying a line of Hardware, Stoves, Tinware and such goods as are usually kept in a first-class Hardware store; excepting in places where there are no regular Hardware stores. General stores who do not use the line in a way that demoralizes the trade, and any other store not objectionable to the regular dealers in such territory, shall be construed as legitimate.

Resolved, That it is not the intention of the above resolutions to prevent the interchange of goods mentioned between manufacturers and wholesale dealers in such goods, or for export trade, and that the further interpretation of these resolutions is hereby vested in the Executive Committee, with power. The following are exempt from these resolutions: The United States Government, railroads and such manufacturing industries and companies as the Executive Committee may approve, for such goods as are necessary for their respective lines of business.

Resolved, That any manufacturer or jobber in Hardware, Stoves, Tinware or kindred goods furnishing net prices or any discount from list prices, contrary to the foregoing resolutions, either by themselves, employees or agents, shall be considered as disapproving the above resolutions.

Resolved, That this association shall, as far as lies in its power, keep a record of all goods sold, and by whom sold, through prejudicial channels, and of all other violations of these resolutions.

Resolved, That every member of this association is constituted a committee of one, and is expected to report to the proper officers any violation of these resolutions.

Resolved, That it is the sense of this association that bids direct to consumers or contractors by jobbers or manufacturers, upon any kind of finishing or rough Hardware entering into the construction of buildings, are injurious to the retail trade, and that all such bids should be made by or through a regular Hardware dealer.

Resolved, That all meetings of the State association should be closed meetings, and that the published reports of the proceedings of same should be under the supervision of a press committee.

Resolved, That these measures are just and necessary for our welfare, and it is expected that their rigid enforcement will be observed.

Resolved, That this convention indorses the above, and urges its officers to use their best efforts to bring about the further formation of State association so as to insure a greater national association, with the end in view that a uniform system of protection for the trade will prevail throughout the country.

The report of the Nominating Committee received the unanimous approval of the convention. The result was the election of the following officers:

President, H. D. Hull, Troy.
First Vice-President, W. D. Hallowell, Penn Yan.
Second Vice-President, Thomas Maloney, Elmira.
Secretary, John R. Taylor, Little Falls.
Treasurer, J. B. Foley, Syracuse.
Directors, One Year: Chas. Sherwood, White Plains; J. H. Callahan, Binghamton; A. F. Miller, Olean.
Two Years: G. B. Allen, Buffalo; Louis Ernst, Rochester; H. M. Countryman, Potsdam.
Three Years: O. D. Towne, Saratoga Springs; Geo. W. Rockwell, Horseheads; Allen S. Matthews, Fort Covington.

Bradley Detachable Shelf.

Atlas Mfg. Company, New Haven, Conn., have just put on the market the Bradley detachable shelf, as here illustrated in detail. Fig. 1 shows one of the two brackets necessary to sustain the shelf. Fig. 2 illustrates the shelf in the act of being forced into place. Fig. 3 represents the shelf and bracket complete as in use. No screws, nails or tools, it will be observed, are required to put the shelf in position. The buyer is able to buy the article complete (board and bracket), ready to put up. This device is made in two styles of shelf and two lengths of each; one has japanned brackets and whitewood board, the other being furnished with nickel plated brackets and oak board. The sizes of each are 4½ x 17 inches and 4½ x 21 inches. The shelves are 5-16 inch thick, and will hold all the weight that is likely to be put on them. They are put up one dozen in a paper box and 12 dozen in a crate.

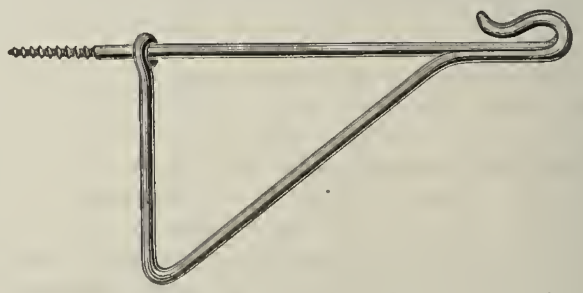


Fig. 1.—Bracket for Bradley's Detachable Shelf.

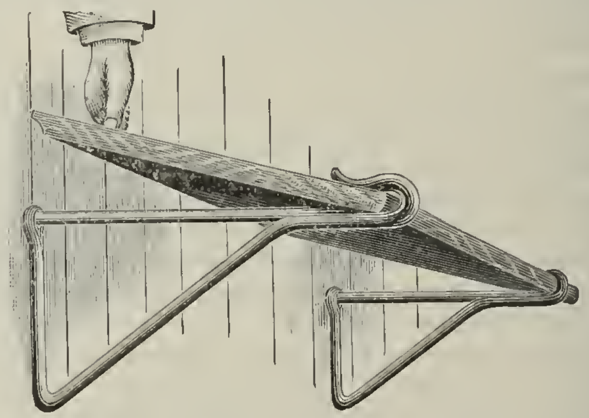

Fig. 2.—Method of Erecting Shelf.

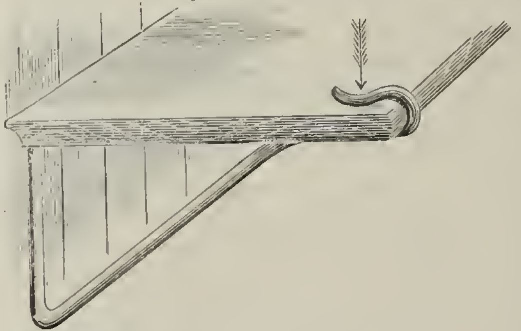

Fig. 3.—Section of Shelf Ready for Use.

Corrugated Sprinklers and Coal Hods.

The National Enameling & Stamping Company are offering a new line sprinklers and coal hods, which are made at their factory at Baltimore, Md. In Fig. 1 of the illustrations herewith is shown the improved corrugated sprinkler made with stamped, seamless breast and zinc rose. These sprinklers are constructed of heavy sheet steel, galvanized after being put together, and greatly strengthened by corrugation. The stamped bent spouts are double seamed, and the body is supported by a heavy breast securely riveted. The strong top and back handles are wired, clamped and riveted in such a manner as to insure durability. These sprinklers are made in 4, 6, 8, 10, 12 and 16 quart capacity. The company also manufacture a line of plain, galvanized sprinklers of similar size and capacity, but without corrugations.

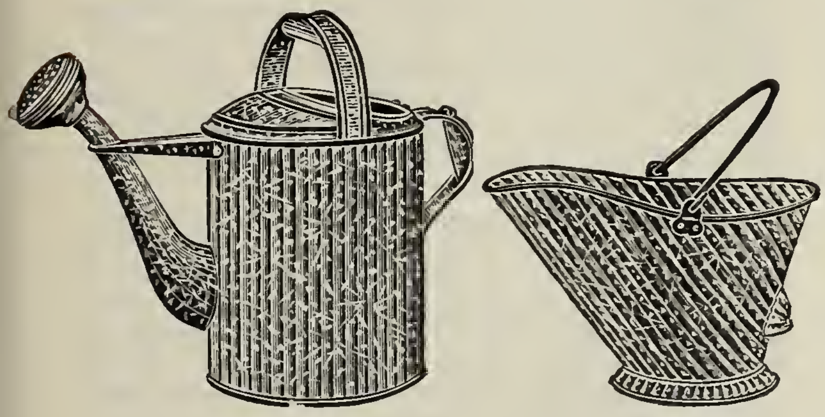

Fig. 1.—Corrugated Sprinkler. *Fig. 2.—Corrugated Coal Hod.*

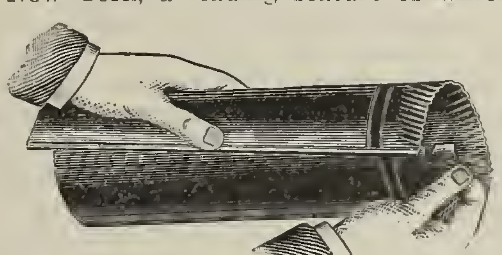
National Sprinklers and Coal Hods.

What is claimed to be a new departure in coal hods is shown in Fig. 2. The novel feature of this article is the corrugated body, bottom and foot, which the manufacturers claim makes the article much stronger and prevents it from being easily dented. A special advantage of these coal hods is in pouring into the stove, as the coal passes out of the corrugated hods more freely and into a smaller opening without spilling than from plain hods. They are made from the best quality of sheet steel, with a double seamed bottom, and are 15, 16, 17 and 18 inches diameter. The company also make a line of corrugated hods provided with a japanned funnel.

N. E. & S. Company's Patent Stove Pipe.

We give below illustrations of the stove pipe manufactured by the National Enameling & Stamping Company of New York, a leading feature of which is the patent lock. In Fig. 1 is shown the manner of fastening the joint, while Fig. 2 represents the stove pipe as it appears with the finished joint. It will be noticed that the device for holding the seam together is very simple and at the same time very effective. The company state that they have a large demand for their stove pipe and are prepared to furnish all information on these goods, together with prices, on application.



N. E. & S. Company's Stove Pipe.—Fig. 1.—Manner of Fastening Joint.

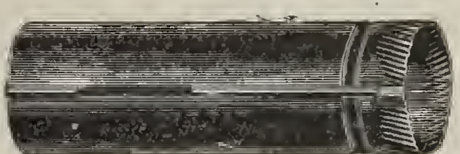


Fig. 2.—Finished Joint.

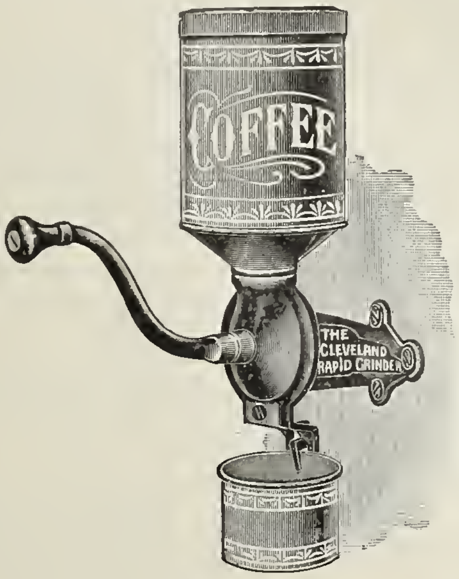
The Cleveland Rapid Grinder.

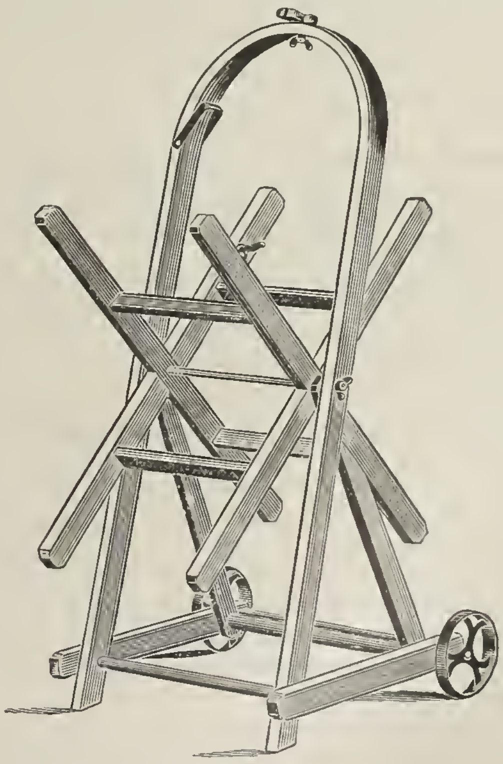
The Harris Mfg. Company, Cleveland, Ohio, are offering the coffee and spice mill shown herewith. The canister, which holds a pound of coffee, is screwed over the neck formed by the casting, and can in no way become detached, it is explained, without loosening the screw at the lower part of the mill. The cup below can be detached easily, it is shown, by raising the slide at the back without spilling the contents, and when attached will not shake loose. The grinders are so constructed that all spices as well as coffee can be ground to any size required, by turning the wing nut at the back of the mill. The manufacturers state that the mill is well constructed, durable and efficient in operation.



The Cleveland Rapid Grinder.

Improved Hose Reel.

J. A. Dubuar Mfg. Company, Northville, Mich., for whom Hendricks & Class, 150 Nassau street, New York, are direct representatives, have recently begun the manufacture of an improved form of bow top garden hose reel, as illustrated. The particular feature of this reel, as now made, is that it is much stiffer and more rigid, there being four legs instead of two as heretofore. It is made of hard wood, is strong and substantial, and can be knocked down for shipment in bundles of one-half dozen each.



Improved Bow Top Garden Hose Reel.

Stove and Hardware Dealers.

Sidney Shepard & Co., Buffalo, N. Y., are offering a stand and a complete set of their Kitchen Specialties free of charge to customers buying the firm's assortment of Quick Selling Kitchen Specialties. The design of the display stand and samples is to increase the sales of this class of goods.

S. L. Duff has admitted a partner in his Hardware, Stove and Farm Implement business in Quenemo, Kan., and the style is now Duff & Graham.

C. L. Fewell has admitted a partner in his Hardware and Stove business in Corsicana, Texas, and the style is now Fewell & Jester. They discount all their bills.

Wilson & Nagle are successors to Leech & Wilson in the Hardware, Stove and Tin business in Mechanicsville, Iowa. The new firm are putting in additional shelving and have also increased the storage room.

Several months since B. B. Myers bought the stock of Ott Bros., Bucyrus, Ohio, the business being continued under the style of Bucyrus Cash Hardware Store. Mr. Myers also conducts a cash Hardware store at Nevada, Ohio, E. E. Fraise being the manager at that point. The line of goods carried at both stores embraces Hardware, Stoves, Tinware, Cutlery, &c.

W. B. Barstow, Manilla, Iowa, wholesale and retail dealer in Hardware, Stoves, Agricultural Implements, Sporting Goods, Buggies, &c., has been succeeded by Barstow & Sanders, who have just moved into a $13,000 brick building, giving them 8000 feet of floor space, and attractively and conveniently fitted up.

Western Hardware Company, Spokane, Wash., have been succeeded by Goodsell-Wilson Hardware Company, who will continue the wholesale and retail business in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

The New York branch of Matthews & Willard Mfg. Company, Waterbury, Conn., manufacturers of various kinds of Lamps for household use, bicycles, automobiles, &c., also Chafing Dishes, has been removed from 40 Murray street to Fourth and Wooster streets.

Simmons Hardware & Mill Supply Company, Beaumont, Texas, have changed their name to Simmons Hardware Company and have increased their capital stock from $10,000 to $20,000. Arville Ewing has been elected treasurer and has assumed the management of the concern. The company will value catalogues, quotations, &c., relating to general Hardware, Sporting Goods, House Furnishing Goods, &c.

R. E. Zimmerman has succeeded Jos. H. Barker in the Hardware and Stove business in Beaver Falls, Pa., and requests manufacturers to send catalogues and other printed matter relating to general Hardware, Tinware, Paints and Oils, Stoves, Glass, House Furnishing Goods, Lime, Cement and Sewer Pipe.

E. C. Kurtz and R. J. Maple have embarked in the Hardware business at Nottingham, Ohio, under the style of Nottingham Hardware Company. The store of the new firm has been thoroughly fitted up for the business and a complete stock of Hardware, Stoves, &c., will be carried. They also have a department devoted to plumbing and tinning. The firm would be pleased to receive catalogues, price-lists, &c., pertaining to the above lines.

Watt Harley Holmes Company, Fitzgerald, Ga., will open a new store at Cordele, Ga., where they will carry Shelf and Heavy Hardware, Mill Supplies, Tinware, Sporting Goods, Crockery, &c. They request catalogues and price-lists relating to these lines. D. Holmes, secretary and treasurer of the company, will manage the new store.

W. M. Dailey & Son, Kennedy, N. Y., have removed their general Hardware and Stove stock to Falconer.

Bond & Bours, Jacksonville, Fla., who embarked in the retail Hardware business three years ago and have met with a good deal of success, have lately moved to new and finer quarters, consisting of two three-story buildings, one 24 x 114 feet and the other 30 x 100 feet, with new fixtures throughout. With their removal to the new quarters the firm have opened up a wholesale department and will soon send out salesmen to work Florida and parts of Georgia. Their line embraces Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements and Sporting Goods.

G. E. Clark, Eaton, N. Y., has disposed of his Hardware, Stove and Farm Implement business to A. H. Dresser, formerly of Lebanon. Mr. Dresser will add to the above lines the sale of Adamant, Plaster, Cement, &c.

Edwin E. Rall has succeeded W. P. Dautel in the Shelf Hardware, Stove and Plumbing business at Glasgow, Mo.

For the purpose of securing additional capital to carry on their business, which had increased beyond their ability to handle it, Bynum & Butcher, Ensley, Ala., have incorporated under the style of Bynum & Butcher, Incorporated. The company do a wholesale and retail business in Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods.

Baily & Rusk, Mt. Sterling, Ill., have decided to add a new and complete stock of Hardware to their former business as dealers in House Furnishing Goods, Stoves and Furniture. Leo Clark has purchased a third interest in the concern, and the style has been changed to Baily, Rusk & Clark. They are putting in new shelving in the old establishment, and are also building an addition, 40 x 50 feet, two stories high.

J. E. Ferguson Hardware Company, Kingman, Kan., have been incorporated with a capital of $20,000, succeeding Ferguson Bros. The stockholders of the new company are all members or employees of the old firm. The company will handle Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c. J. E. Ferguson will manage the business.

G. W. Storey has succeeded A. H. Owens in the Hardware, Stove and Tinware business in Hedrick, Iowa.

A. F. Bergling has disposed of his Hardware business in Albert City, Iowa, to Lodin & Danielson.

John Buschers & Co. are successors to H. J. Oltrogge, dealers in Hardware, Stoves, Plumbing Supplies, &c., Waterloo, Iowa.

G. W. Gurley & Sons, Purdy, Mo., have been succeeded in the wholesale and retail Hardware, Stove, Agricultural Implement and Sporting Goods business by Gurley Bros.

Thomas Hardware Company, Bedford City, Va., have lately taken possession of their fine new building, which is owned by members of the firm. There are two entrances to the store, one on Main street, leading into the Stove and Tinware department, and the other on Bridge street, where General Hardware is carried.

P. C. Sheer has recently commenced business in Dover, Mo., handling Shelf Hardware, Stoves, Tinware, Agricultural Implements, Buggies, &c.

Jeffries & Son, Hardware and Stove merchants, David City, Iowa, have been succeeded by I. N. Jeffries.

Evans & Dean have bought out G. W. Songer, dealer in Hardware, Stoves, Farm Implements, &c., Hoopeston, Ill.

The National Enameling & Stamping Company of New York are calling special attention to their complete line of Dairy Supplies. The company have so thoroughly studied the wants of the farmer and dairy trade that they are in a position to furnish anything that is demanded in this line. They also call attention to their fall goods, which include Coal Hods, Stove Pipe, Shovels, Dripping Pans, &c. The Stove Pipe and Dripping Pans manufactured by the company are made from a smooth and even colored steel and have a very fine appearance. The company are prepared to furnish catalogues covering their extensive line of goods to any one interested, upon application to any of their branch offices in New York, Chicago, St. Louis, Baltimore and Milwaukee.

The Dowagiac Canning Company of Dowagiac, Mich., are giving up their canning business and will embark in the manufacture of Kitchen Utensils.

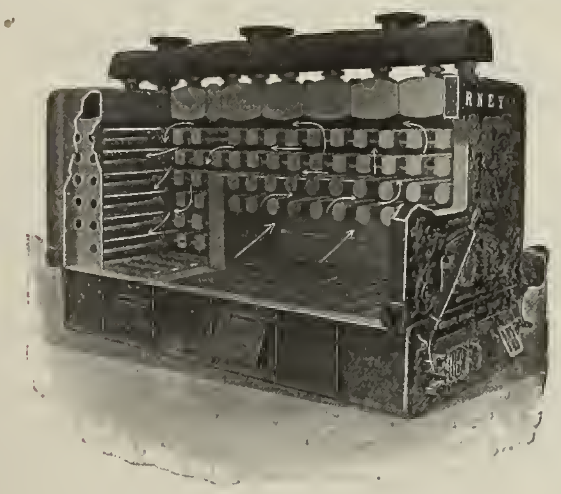
Leroy Miller has opened a retail Hardware, Stove and Tinware store at Queen City, Mo.

Water Closet Combinations.

The Great Western Pottery Company, with plants at Kokomo, Ind., and Tiffin, Ohio, have recently issued their catalogue No. 4 devoted to modern water closet combinations and to plumbers' earthen ware, plain and decorated, and vitreous china specialties of every description. The catalogue is of 64 pages, of highly finished paper, and is well printed. It opens with a variety of low down tank water closets of the latest construction and equipped with earthen ware tank. The closets are of the siphon jet and siphon action and wash down types. They are of the latest shapes and of most pleasing designs, both plain and embossed, some being decorated with gold. These are followed by a variety of high flush tank closets, the tanks being also made of earthen ware and ornamented so as to be in keeping with the most handsomely equipped bathroom. The latter portion of the catalogue is devoted to general and sectional views of the various types of closets made by the company, together with plan views, in which the important dimensions are given for the convenience of the plumbing trade. The sectional views enable a correct idea to be formed of the connections of the various types of siphon jet, siphonic action, wash down and wash out closets. One section of the catalogue is devoted to different types of urinals, urinal hoppers and a variety of wash basins, which are shown in round, oval, oblong and rectangular form, plain and embossed and decorated.

The 1200 Series Bright Idea Boilers.

The Bright Idea steam and hot water heaters put on the market by the Gurney Heater Mfg. Company of Boston, Mass., with New York office at 111 Fifth avenue, have become well known to the trade in the smaller sizes. Particular attention is now being invited by the manufacturers to the 1200 Series, a broken view of which is presented herewith. This boiler is of the vertical sectional type, and increased surface for absorbing the heat from the fire and from the gases and imparting it to the water and steam is secured by the connection with the vertical section of especially constructed castings, as shown in the engraving. The result of this peculiar construction, which is known as the Bright Idea, has been to develop a high efficiency with an equally satisfactory economy in the use of fuel. This type of boiler is made in several series, the 600 Series, the 700, 1100 and 1200 Series, the lower series having a grate 26 inches wide, the next series 36 inches wide, the next 40 and the latest production—the 1200—having grates 48 inches wide and varying from 42 inches to 84 inches in length.



The 1200 *Series Bright Idea Boilers.*

These boilers are well adapted to the varying requirements of the steam fitter, having a range of capacity from 900 square feet of direct steam radiation in the smallest size of the 600 Series to 7000 feet of direct steam radiation in the largest size of the 1200 Series, and from 1500 to 11,500 square feet of hot water radiation. The products of combustion, being played over the large fire tube surface, pass over the bridge wall into a large combustion chamber at the rear, in which there is also a large amount of fire tube surface. From this chamber the gases pass to the final smoke outlet at the bottom. At the rear bridge wall section there is a draw out door, for the purpose of dumping into the ash pit any accumulation of ashes or soot that may collect back of the bridge wall or in the combustion chambers. It is pointed out that the character of the surface in this arrangement enables soot and ashes to be readily brushed off, thus avoiding the reducing of the heating power of the boiler from its nonconducting effect.

It is also pointed out that in the largest size of these boilers a very low water line is carried, enabling the steam fitter to secure its installation in low cellars and to give a good pitch to his mains. The total hight of the largest size of heaters is 83 inches, while the water line is but 56 inches. The company issue a catalogue giving full details not only of the Bright Idea line of boilers, but also of their Doric and 400 Series, which are of the round horizontal sectional type, as well as the extensive line of radiation which they manufacture.

The Webster City Steel Radiator Company.

A meeting of the stockholders of the Webster City Hot Water Heating Company was recently held in Webster City, Iowa, for the purpose of changing their articles of incorporation. Resolutions were adopted changing the name to the Webster City Steel Radiator Company and the capital stock was increased to $75,000. The following officers were elected:

President, W. J. Zitterell.

Vice-President, A. N. Boeye.

Secretary and Treasurer, James Kephart.

Directors: The officers and W. N. Merrill, L. A. McMurray, J. W. Young and A. F. Hoffmann.

The company will manufacture steel radiators and heating apparatus, also boilers, engines, feed steamers and other similar articles, as well as conducting a general manufacturing business, including repair work.

The New York Trade School Roll of Honor.

Through an error in the list furnished us giving the "roll of honor" of the graduates at the New York Trade School for the season just closed, the name of W. D. Grant of Kane, Pa., was omitted. We have received from Mr. Grant a copy of a letter from the New York Trade School, stating that in his final examination he reached the 100 mark in all branches of his work, and therefore was entitled to a place on the "roll of honor."

Protection of Metallic Tubes in France.

United States Consul Thornwell Haynes of Rouen, France, reports that M. Bergier, a Frenchman, has just discovered a composition for protecting metallic tubes against the action of liquids. The composition, says the consul, consists of the following:

	Kilograms.	Pounds.
Dry sand	100	= 220.4
Potash or soda	83	= 182.9
Nitrate of potash	2	= 4.4
Minium	15	= 33
Pulverized marble	5	= 11
Dichromate	0.10	= 0.22
Red oxide of copper	0.05	= 0.11
Regulus of antimony	0.05	= 0.11

This is applied to the interior of the tube as follows: The vitreous substance is first blown into cylindrical form and is then introduced into the tube, which has been brought to a white heat, the blowing being continued until the composition adheres to the metal. The consul adds that the composition is claimed to have an expansion and contraction equal to that of the metal which it protects.

The F. A. Wendell Heating & Plumbing Company of Salem, Mass., have been awarded the contract for plumbing what is said to be one of the finest stables in the world, which is being built at Egypt by J. W. Lawson. The company also have the contract for plumbing and gas fitting the new Swift Building.

Practical Lead Work.

BY D. F. N.

Old plumbers will recognize as familiar and young plumbers will take interest in some of the hand made grease and fixture traps, which were formerly quite frequently formed up and put together for use in country residences by the plumber, or worker in lead, as defined by Webster. Several of these traps are shown in the accompanying illustrations. The trap in Fig. 1 is made from a piece of 8-pound sheet lead, or a piece of 8-inch lead pipe beaten up to a smaller opening at the top to take a 4-inch screw plug. The bottom is made of a flat piece of lead 2 inches larger in diameter and secured by means of a wiped flange joint. The 4-inch screw plug is also wiped on. Two pieces of 2-inch lead pipe for inlet and outlet are filled with sand and then bent to the required curve before they are wiped on to the body of the trap. This was formerly considered a very good trap; but it needs cleaning and should be taken care of when full.

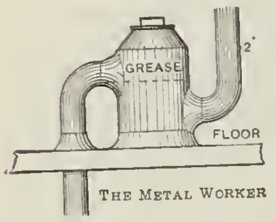


Fig. 1.—A Drum Trap.

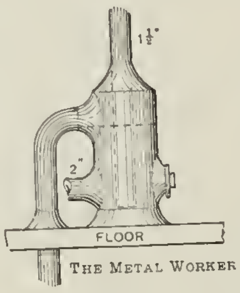

Fig. 2.—Bottle Trap.

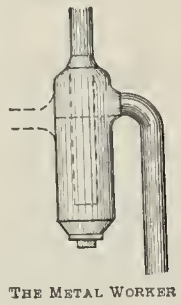

Fig. 3.—Bottle Trap.

Practical Lead Work.

A bottle trap adapted for use in connection with several washtubs is shown in Fig. 2, the top inlet to the trap receiving the discharge from the first tub with 1½ or 2 inch branches up to the different tubs forming the set. This trap is provided with a 2-inch or 3-inch main waste outlet, according to the size and number of tubs or fixtures connected with it.

The bottle trap, shown in Fig. 3, with vertical or horizontal outlet, is regarded by some as being somewhat dangerous. The disadvantage is due to the corrosive effect of the sewer air on the inlet pipe at the water line in the trap, which is sometimes eaten away, killing its efficiency as a trap by allowing sewer air to enter the building. These traps were made from a piece of 2-inch pipe 10 inches long with a 1½-inch inlet and outlet; or, when used in connection with larger fixtures, a piece of 3-inch pipe 11 inches long with 2-inch inlet and outlet. The larger trap is adapted for use where a sink and a couple of tubs are arranged close together, the smaller sizes being used for wash basins. This trap is also made as an angle trap with an outlet made as shown by the dotted lines.

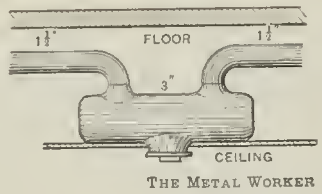

Fig. 4.—A Running Bath Trap.

A running trap for use under a bathtub is given in Fig. 4, the body being made of sheet lead with a 2-inch or 3-inch nickel plated trap screw in it, set so that the screw would come even with the finished ceiling in the room below the bathroom. If for any reason it is necessary to have the trap further above the plaster, a short piece of pipe of the size of the trap screw is used between the body of the trap and the trap screw, so as to bring it down flush with the ceiling. This enables any obstruction in the trap to be removed from below; but, owing to the arrangement of the inlet pipe, which projects nearly to the bottom, it has the same objection that has been mentioned in connection with the bottle trap.

Traps made from lead pipe are shown in Figs. 5, 6, 7 and 8. After the pipe has been filled with sand it is heated, so that when a drop of water touches the pipe it will leave it at once; then the pipe may be bent without kinks or buckles, or without risk of destroying it. The trap in Fig. 5 is easily formed around a piece of soft wood 2 inches or more thick to make a true circle, and the ends are bent so that the inlet and discharge are in a straight line. All of these traps are provided with a trap screw and are made from D lead pipe. The shapes of these traps show that they are adapted for different purposes. They are mainly used in connection with small sinks or lavatories.

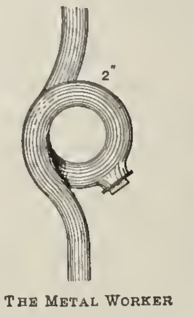

Fig. 5.—Straight Trap.

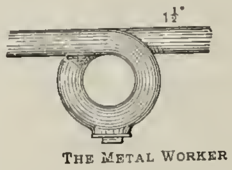

Fig. 6.—Running Trap.

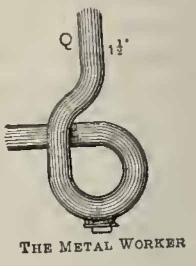

Fig. 7.—Half S Trap.

All sanitary experts agree in the claim that the full S-trap is the most perfect trap produced. In Fig. 9 a half S-trap is shown adapted for sinks or lavatories, when connected with the waste line and concealed behind the fixture. The claim is made by some that this trap can be partially emptied by capillary attraction. It has the advantage, however, of being thoroughly scoured every time the fixture is emptied.

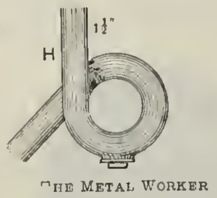

Fig. 8.—Three-Quarter S Trap.

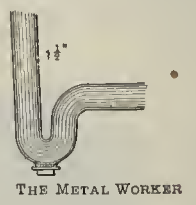

Fig. 9.—Half S Trap.

The plumber is frequently called upon to make either a round or an almost square bend in both service and waste pipes, as shown in Fig. 10. This requires a little skill and judgment. To make the square bend the pipe should be filled with hot, fine sand, packed down hard, and the pipe should be well heated, or to a temperature that will make a drop of water leave it as soon as it touches it. The bend should be turned short and should be made by taking a firm hold of one end, driving down with a soft pine block on the back of the pipe, so as to drive the lead into the crotch of the bend. This must be done on each side of the bend and the pipe should be dressed into shape with a soft piece of pine wood as a dresser. By patience and care this can be made with an exact angle in the crotch. Fig. 11 shows what is called the tinkers' bend, made by cutting a V shaped piece from the straight pipe, so that it can be bent down to form an angle and then either burned or soldered to make it perfectly tight.

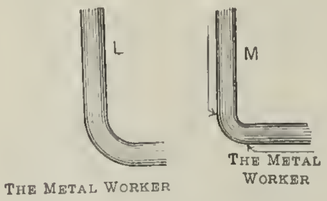

Fig. 10.—Plumber's Bends.

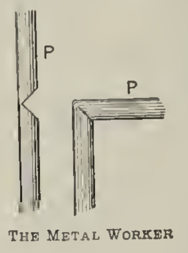

Fig. 11.—Tinker's Bend.

The plumber can impart some attractiveness to the appearance of his work if the customer will allow it. Fig. 12 shows an ornamental method of arranging the supply pipe to a wash basin. The main supply pipe, with the stop cock on it, is brought up through the lead safe to catch any water that might overflow and otherwise cause damage. The upper end of the stop cock is wiped into the side of a piece of pipe by means of a branch joint. This pipe is then bent in a circle until the two pieces meet, when both ends are bent so as to run vertically. One of the ends is soldered tight and forms an air chamber to take up any shock that will be caused by a quick closing of the faucet, and the other end receives the brass coupling for connecting the basin cock.

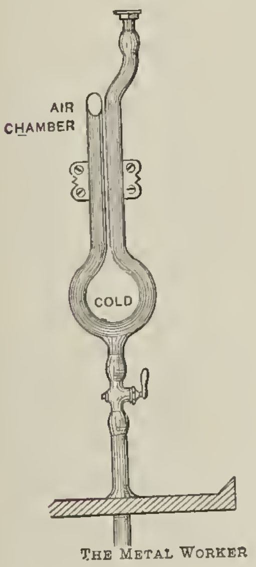

Fig. 12.—Air Chamber to Basin Supply.

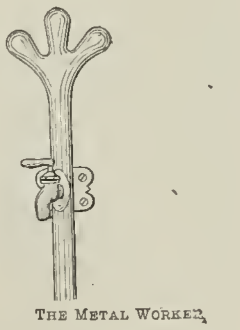

Fig. 13.—An Ornamental Air Chamber.

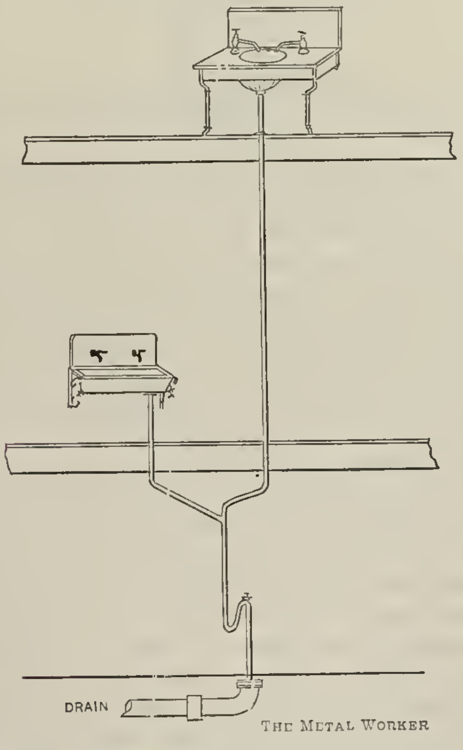
An ornamental air chamber above a sink bibb is shown in Fig. 13. Here the end of pipe is beaten by the plumber into a fantastical shape to show his skill as a lead beater and to please the eye of his customers, while serving the useful purpose of an air chamber.

IMPROPERLY ARRANGED TRAPS.

BY OLIVER TWIST.

Those of us who have had to remodel old plumbing work to remedy some objectionable feature can realize the wonderful combinations of blunders that are continually turning up; splendid object lessons of how not to do it. Fig. 1 shows how a job may be done for a customer, of which it could be said that the fixtures were good, the pipe heavy, the joints well made, and both fixtures trapped to keep out any sewer gas, and yet, after all, what an unsanitary job it is! Perhaps the plumber had not studied his business, or was inclined to be economical, as he used only one trap where he should have used two, and he placed that one at the cellar floor, leaving a long stretch of dirty pipe to generate gas and give off foul smells into the house. Instead of keeping sewer gas out of the house it was being kept in. Each fixture should have been trapped separately as close to the fixture as possible. Even if such were the case, the job would have still been bad, as when either fixture was discharged, the other, or both traps probably, would have lost their seal through siphonage. This might have been overcome by proper ventilation.



Improperly Arranged Traps.—Fig. 1.—An Example.

Some people have gone to the other extreme. Instead of not using enough traps to make a good job they have argued that if one trap is a good thing two must be better, and have placed two traps on one fixture. This double trapping is sometimes brought about unintentionally through the failure to look into the concealed portion of the work when adding new fixtures to old jobs. Numerous examples of this might be shown. Not long since the writer came across one like that shown in Fig. 2. It may have come about in this way: Years ago closets having a trap within themselves as a part of their make up were the exception rather than the rule, so that it was customary to put a 4-inch lead trap beneath the floor. When this needed renewal the plumber came along with his new earthen ware closet, which is already trapped and is a wonderful improvement over the old cesspool he removes. He either saw no harm in it, or he knew no better, for, instead of removing the old trap and rearranging the connections, which would mean quite a lot of extra work, which he would be unwilling to do after making a contract with the owner to put in a new closet for so much, he puts the new fixture in the same spot that the old one occupied.

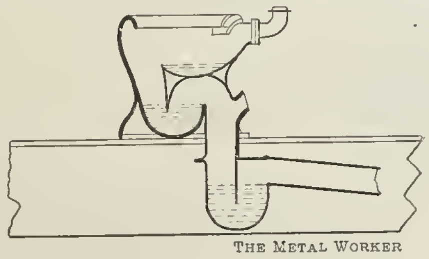


Fig. 2.—Additional Trap a Disadvantage.

If it be of the wash down variety there will probably be no ventilation from it. Consequently it will create an air lock between the two traps that will act like a spring or cushion when the closet is discharged and retard the flow through it, while retaining in the traps until the next flush matter that should be washed out clean to the sewer every time the closet is flushed. If it is of the wash out style it will appear as in Fig. 2, having a vent connection which will tend to improve matters by allowing the air to be removed from between the traps during the discharge, but will not do away with the other trouble mentioned.

Double trapping when applied to a sink is bad. The waste water will accumulate in it, perhaps half full, if the traps are not vented, before enough pressure is obtained to force the air lock, thus giving people the impression that the sink waste is stopped, but will clear itself in a little while, which it does as soon as more water is admitted. Siphonage is then produced and the contents run away quickly, just exactly as though a stoppage in the pipe had been removed.

Springfield Journeymen Plumbers.

The journeymen plumbers of Springfield, Mass., have presented the following resolution to the master plumbers for adoption:

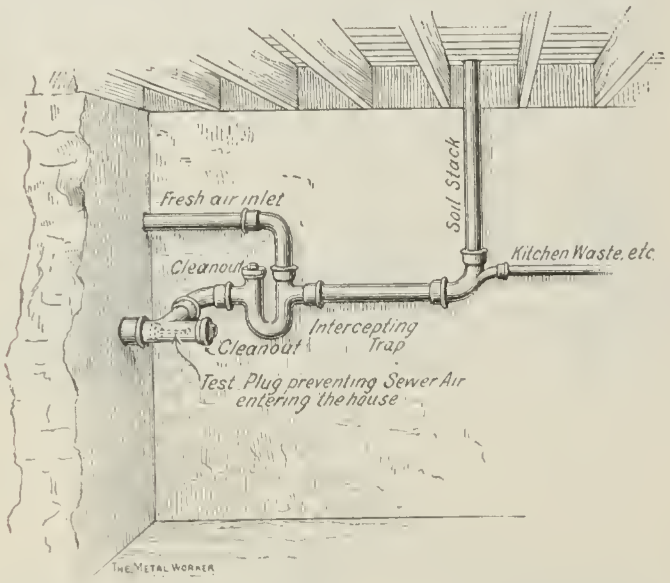
"On and after May 1, 1902, no helper or helpers shall be employed in any shop, and no member of the local union shall be allowed to have or work with a helper. Each shop may be allowed to have one apprentice only, and he shall be allowed to work with journeymen, and they shall instruct him in the trade. When no journeyman is constantly employed a shop shall not be allowed to have any apprentice or helper."

This resolution has been prepared for the purpose of limiting the amount of unskilled labor employed by master plumbers, and to work a remedy for the oversupply of journeymen plumbers in that vicinity.

Treatment of Plumbing Not Used in Summer.

BY HELMAR.

What to do to the ordinary plumbing system in order to guard the residence against the entrance of sewer gases during the summer months, while the family are sojourning in the mountains or at the seashore, is a problem that will probably never have a solution specific enough to admit of universal application. The condition sought is always the same, but the construction of buildings, installation of plumbing, type of fixtures, &c., vary so much that the precautions which prove effective in one job are futile in another. And the question is often made more perplexing by the owner insisting on leaving part of the job in operation and in the care of servants, who, no matter how good their intentions, seldom follow instructions. As the time is now near at hand when plumbers will again be called upon to perform such work, the experience of one of them will be welcomed by many.



Treatment of Plumbing Not Used in Summer.—Fig. 1.—A Positive Seal of Sewer Pipe.

The most general method is to empty the traps and fill them with something that will not evaporate or dry up so quickly as water. This is cheap and quickly done, and, as a rule, the plumber is not called again when the family returns, because the fillings can be " flushed " out with water, which is one reason why the plan is more or less unreliable, according to circumstances, and is never so safe as when sewer air is excluded from the house entirely. Glycerine, kerosene, castor oil or lard oil is used. Glycerine is best, and kerosene is a good second choice where there is no danger of it being either sucked or waved out by vacuum or pressure, as is sometimes done by storm water when the house drainage and storm water are carried by the same pipe and the relief vents poorly arranged or proportioned.

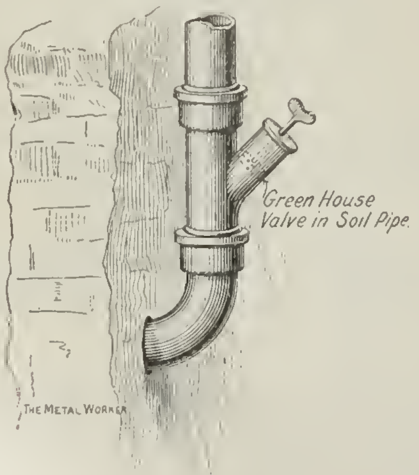


Fig. 2.—An Improvised Valve.

When any of the above seals are depended upon water must not be dumped nor drawn into the fixtures. Every trap, except water closet traps, has, or ought to have, a drain screw or top cap through which the water seal can be drawn or soaked out with a sponge or rag. Water closet traps always have to be soaked out. Only the upper trap of double trap closets need be filled, but the air pipe must be fitted with a blind washer to keep sewer air from coming out through the tank. The contents of each trap should be noted when the water seals are being taken out, as the amount of water removed gives a fair idea of how much glycerine should be put in. Before emptying, the traps should be flushed well to cleanse them and to make sure that the seal is as deep as the trap will permit. The trap should be well wiped with a swab, and examined before filling to see that there are no strings, hair or lint hanging over into the waste pipe. These, if present, will rob the trap of the filling by capillary attraction.

When none of the fixtures are to be used during the summer months, the writer has found it a good plan to insert a test plug through the clean out where the main soil pipe leaves the house and expand it so as to prevent air from the sewer from entering the house at all. The handle of the plug should be in far enough to permit screwing on the clean out cover. This plan leaves only the foul surface of the house system to deal with, and if the fresh air inlet is in proper condition it will keep the system filled with fresh air at all times, and the job would be comparatively safe without further work.

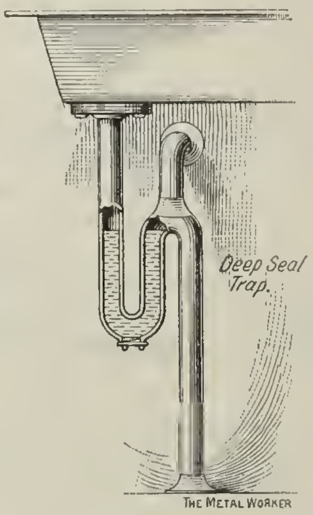

Fig. 3.—A Deep Seal Trap.

If no clean out exists, as shown in Fig. 1, the clean out of the intercepting trap may be removed and a short handle test plug dropped in and expanded in the out leg of the trap and the trap cover replaced air tight. When the plug is set with the handle upright, it will do no harm to pour in enough glycerine to cover the ring and plate.

If the intercepting trap is outside of the house, plugging the pipe through a clean out also cuts off the ingress of air to the house system through the regular fresh air inlet. This may be gotten over by providing a temporary inlet from the outside, connecting the same with the clean out opening.

On two occasions the writer has left off the clean out cap, thus allowing the vent stack to draw air from the cellar. No complaint was heard, and nothing discovered that would deter him from doing so again, but he does not recommend the practice. Where no clean out exists through which the pipe may be plugged, the writer would not hesitate to break the line and put one in, full size, with brass screw cap. The clean out will not only be serviceable on sundry occasions otherwise, but also serves from year to year as a means of plugging the pipe for this special purpose.

The writer was called to put the plumbing in order after a family had returned from the country and found their regular plumber had died. In the sewer side hand hole of the intercepting trap he found a wad of paper over which was a layer of hydraulic cement, covered by ¾ inch of asphalt varnish. The trap had two hand holes, and there was no fresh air inlet in the job. The house side hand hole was open, and the sewer side closed, the loose cover being wired to the trap. This proved that more than one plumber was working along the same line of thought, though unknown to each other.

In Fig. 2 is shown a soil pipe, where it passes out through the wall, in which the owner, a florist, had placed a peculiar form of greenhouse heating pipe valve. The valve, although of favorable design, was somewhat of an obstruction, but it accomplished the idea of shutting sewer air out of the house during the summer while the family were away.

Plugging the soil pipe makes it necessary to stop the supply to the fixtures, either shutting off the faucets tight and leaving them so, or by shutting off the water and draining the pipes. If the boiler is also emptied, the sediment cock should be closed again. The writer prefers to leave the boiler filled. If emptied, there is some danger of injuring the water back by having a fire started while it is empty. If left filled, the boiler must be emptied and thoroughly cleansed before the work is again put in operation. When the supplies are drained the faucet washers dry out, get hard and give trouble when the water is again turned on, and one must watch all unions that have washers in them. In fact, it is safer to rewasher all unions and faucets to begin with, if the supply has been empty during the summer.

If the soil pipe has been plugged as described, the next thing to do toward making the work perfectly safe is to choke the waste pipes of all the fixtures above the traps. If this is not done, the air current through the pipes soon evaporates the seals and leaves the traps open for the passage of whatever gases there are in the pipes. The deep water seal trap shown in Fig. 3 is not a barrier to be depended upon during the warm summer months. It is excellent for rented houses where people are moving in and out at all times of the year, and where the fixtures are out of use but a few weeks at a time. Glycerine is not too expensive to seal traps against evaporation, but it may be displaced by some one inadvertently dumping water into the fixture.

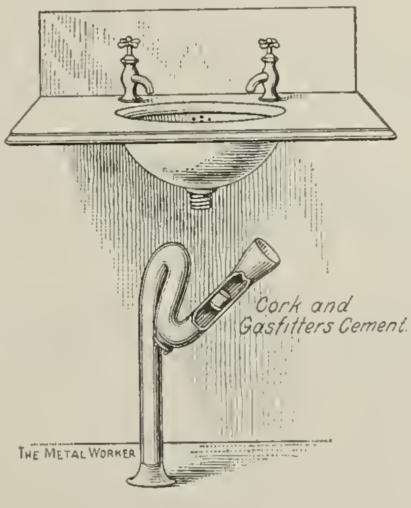

Fig. 4.—Lavatory Trap Disconnected and Corked.

Baths may be choked by lifting out the standing waste stem and plugging the bottom of it tightly with a cork. On lavatories with lead traps the traps can be bent down and choked with a cork and made air tight by melting cement over the top of the cork as indicated by Fig. 4, or a blind washer of sheet lead may be soldered over the top. Sink traps can be treated the same as lavatory traps. Slop sinks can be choked effectively by screwing a blind plate down in putty in place of the regular strainer. Brass lavatory traps can be loosened from the metal bowl plug or standing waste and a blind metal washer put in on top of the ring washer and again tightened up, as indicated by Fig. 5.

The variety of traps, fixtures and conditions are too numerous to be covered in a single article, but what has been said, together with some general directions and the exercise of common sense, will fit any plumber for reliable service in the line of work in question.

An accurate memorandum of what is done to a job should be made when it is finished, because the plumber doing the work may get sick while the work is being done or he may not be available when, in the fall, the job is to be made ready for use again. Or he may have forgotten what he did, and an overflow or other needless trouble and damage may be caused unless there is a guide to work by.

Leather flush washers shrink, crack and sometimes draw entirely out of place when work is not in use. Rubber washers that are not pure are often found cracked and worthless, too. So all washers should be examined before water is turned on or into the fixtures. Putting a job in order again after a summer's idleness is simple enough when it is remembered that it should be put in the same condition in which it was found in the spring. Any repairs found necessary should be done, whether caused by natural wear and tear or as a result of the work in hand.

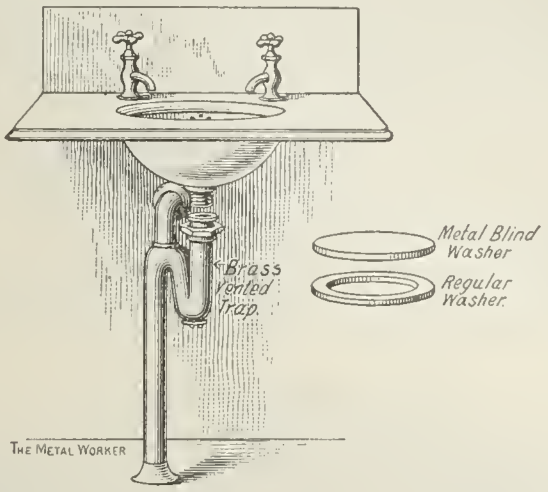

Fig. 5.—Brass Trap Sealed with Blank Washer.

When some of the fixtures are left in operation for the convenience of servants, the servants must be held responsible for the regular use of those fixtures, and the servants should be made acquainted with the condition of the balance of the plumbing. If the whole job is left normal, the servants should flush each fixture every day. If not, a sign of warning should be placed on every fixture having the waste choked. The toilet rooms should be properly aired, as usual, and the doors locked between times, if servants are left in the house at all.

Water closets are the most difficult to choke up safely. The trap can be "soaked" out and sealed with glycerine and the seat fastened down; but perhaps the safest plan is to turn off the supply, drain the tank and remove the closet from the floor and solder the end of trap or bend tightly to the floor.

New York City Notes.

Trade in general still continues quiet, although many shops are busy with old work on hand. Most of the new work in the market is in the line of large buildings requiring many feet of pipe, but without the labor and general material needed in a row of Harlem flats.

* * *

Speaking of Harlem flats as known in former years, the Tenement House Law has completely done away with them. Callan & Oliver, however, are plumbing a row of buildings for Sonn Bros., situated at 140th street and Lenox avenue, which are of the type and cost of buildings destined to supersede the old style of building.

* * *

With many men out of employment at present and not too much work in sight the journeymen plumbers are asking $4.50 a day, with a half holiday on Saturday, the same to commence May 15.

* * *

W. G. Cornell of 54 Lexington avenue is rushing work on his jobs in the office buildings at Maiden lane and Broadway and William and Cedar streets and is having hard work to keep ahead of the tenants moving in. He also has a large force of men at work in the 20-story "Flat Iron Building," at Broadway, Fifth avenue and Twenty-third street.

Commodore Gaynor of the Jefferson Yacht Club put in a new length of leader pipe in the club's flagship last Sunday. As flounders are biting well in Jamaica Bay, the boats of the fleet are in great demand every Sunday.

ASSOCIATION NEWS.

California Master Plumbers.

The annual meeting of the Master Plumbers' Association of California was held at San Francisco, April 24, and was largely attended. The delegates were entertained by an excursion to Oakland, where they were given a banquet by the Master Plumbers' Association of Oakland. They were also given an excursion on the bay, and the San Francisco Association tended them a dinner at Golden Gate Hall. After selecting Los Angeles as the place for holding the next convention, the following officers were elected for the ensuing year:

President, James E. Britt, San Francisco.

Vice-President, T. J. Stephens, Los Angeles.

The association has joined the Interstate League of Master Plumbers.

Texas Master Plumbers.

In response to a call issued by President Shafer, former president of the Master Plumbers' Association of Texas, the master plumbers from all parts of Texas met in San Antonio on April 21 for the purpose of winding up the business of the old association and formally disbanding, in obedience to the laws of Texas, as laid down in the recent suits for violation of the anti-trust laws. After a full discussion of the situation a resolution was adopted disbanding the old association. Immediately afterward a meeting was held and a new association formed with the following officers:

President, Ed. Braden, San Antonio.

Vice-President, J. W. Shumate, Austin.

Treasurer, J. W. Theel, Houston.

Secretary, D. Woodhead.

Dr. G. R. Tabor, city health officer, was elected honorary vice-president, and Beaumont was selected as the place for holding the next meeting. A committee on constitution and by-laws was appointed, and it was ordered that the constitution be framed and submitted to the Attorney-General of the State for his approval or disapproval, all objectionable features to be eliminated from it, as he might dictate.

A MASTER PLUMBERS' ASSOCIATION has been organized in Morgantown, W. Va., composed of the following members: L. W. Joseph, James H. Kennedy, and Hough & Bond. The officers are: L. W. Joseph, president; James H. Kennedy, treasurer, and Fred. A. Bond, secretary.

Employees Remembered by Mr. Hooper.

Those who enjoyed the acquaintance of B. Frank Hooper, president of the Colwell Lead Company, New York, who died on April 20, will have additional cause to honor his memory in learning of some of the provisions of his will. His many acts of generosity during his life were in most instances unknown except to those who profited by them. By the provisions of his will he left $1000 each to his friends, Edgar Vanderbilt and Robert E. Cary, and $200 to every employee who had been 15 years with the Colwell Lead Company. The expressions of sympathy and condolence that have reached his associates and family have been overwhelming in number, coming from leaders in the business world and humbler citizens alike.

THE VAPOR STEAM HEATING COMPANY of York, Pa., have moved their office to 917 Arch street, Philadelphia. A. P. Broomell, president of the company, will continue at 10 North George street, York, Pa., for some time yet, and the Philadelphia office will be in charge of E. M. Barker, heating engineer, assisted by Ralph Ebaugh.

Heating and Plumbing Notes.

A MEETING of the National Committee of the Confederated Supply Associations was held at Niagara Falls, N. Y., on Thursday, for the purpose of attending to the various matters which have been presented to the committee since their meeting in October. As far as can be learned, this meeting was a regular one and has no special significance.

R. WILLIAMSON & Co., manufacturers of Gas Fixtures, Chicago, will occupy in the near future a fine five-story building, 48 x 100 feet, at 61 to 63 Erie street. Plans have been prepared for this building, which is already under lease to the firm.

THE NATIONAL PIPE BENDING COMPANY, New Haven, Conn., manufacturers of the National Feed Water Heater, who make a specialty of Coils and Bends of Iron, Brass and Copper Pipe of all sizes, are distributing a neat catalogue showing illustrations of the great variety of Coils which they can furnish. A portion of the catalogue is devoted to Expansion Bends, Return Bends, and large sweep Elbows for large piping systems. A feature of the publication is a series of perforated pages showing sectional views of Coils of various styles. These are intended to be torn out from the catalogue and sent as an order for Coils, there being a blank space under the cut in which to fill out the necessary dimensions and descriptions, thus avoiding errors in ordering goods.

L. B. DOZIER & Co., Columbia, S. C., began business as jobbers in Plumbers' Supplies on January 20 of this year. They also install steam heat in business buildings and private residences, and handle Gas and Electric Fixtures. They aim to do business both in the city of Columbia and throughout the State of South Carolina. Mr. Dozier, who is the principal owner and manager, was for six years Southern manager for Lantz Brothers of Buffalo, N. Y., with headquarters at Columbia. The company state that they have had a liberal supply of catalogues since starting, but would be happy to receive such literature from houses who have not yet favored them.

THE plumbers of Seattle, Wash., are preparing to conform to the provisions of the new State law affecting plumbers and are filing applications to take out licenses. The examining board will hold the examinations later.

THE PATRICK NACEY COMPANY of Chicago, Ill., have secured the contract for plumbing the new station of the Chicago & Northwestern Railroad at Sioux City, Iowa. The amount of the contract is said to be over $5000.

THOMAS HIGGINS, a plumber, of Louisville, Ky., aged 40 years, dropped dead in the street from apoplexy on April 21.

THE plumbing establishment of Charles Summerill, at Newtown Square, Pa., was destroyed by fire Sunday.

THE Supervising Architect, Washington, D. C., will receive bids until June 2 for plumbing and heating the Hygienic Laboratory of the United States Marine Hospital service at Washington.

THE J. L. MOTT IRON WORKS, 88 Beekman street, New York, have entirely completed the arrangement of their steam and hot water sample room, which has been described in *The Metal Worker*. The decoration of the company's Radiators and Boilers and their arrangement is well worth a visit from the heating contractor, who may wish to secure hints for the arrangement of his own sample room, in addition to other information in reference to the construction, capacity and dimensions of both Boilers and Radiators.

THE HART & CROUSE COMPANY of Utica, N. Y., and 235 Water street, New York, are issuing a sheet giving the dimensions of their new, large Royal Steam and Hot Water Heater. This Boiler is made with a grate 40 inches wide and from 38 to 80 inches long, composed of from 6 to 12 sections. The completed Heater stands 84 inches high and 72 inches wide. The Steam Heater has a 57-inch high water line. The largest size is rated to carry 10,800 square feet of direct hot water radiation and 6500 square feet of steam radiation.

The New York Radiator Company of Utica, N. Y., and 235 Water street, New York City, are distributing circulars of the New York Radiator for steam and hot water heating, showing, by means of a half-tone engraving, a very attractively designed three-column Radiator, which is made in all the usual hights, from 18 to 41 inches.

George E. Versoy, representing the Master Plumbers' Association, appeared before the South Orange, N. J., village Board of Trustees, for the purpose of securing an ordinance regulating plumbing of all kinds. It is said that his petition will be acted upon favorably by the board.

A slight fire visited the plumbing supply house of Edwin Hawes, at Worcester, Mass., on April 23.

The examination for appointment to the office of plumbing inspector at Utica, N. Y., was made so difficult that instead of having three eligibles to select from, as the law requires, but one candidate possessed the necessary information to qualify him. It is said that in order to satisfy the provision of the law another examination will be held which will be made less difficult. The question is raised whether or not this will be just to the candidate who passed the more difficult examination.

Master plumbers and helpers of Washington, D. C., to the number of 90, recently finished up the work on the Plaza Apartment House on Washington Circle. This is the last large job of work in that city which was in need of being rushed through. It is claimed that the master plumbers are in a position to hold out indefinitely on the questions which have brought about the strike in the plumbing trade in that city.

George W. Dunn, president of the Board of Trustees of the New York State Soldiers' and Sailors' Home, at Bath, N. Y., will receive bids until May 8 for heating, plumbing and electric wiring and lighting fixtures for a barrack for convalescents at the Home.

An agreement has been reached by the plumbers of Lynn, Mass., relative to apprentices, which provides that no apprentices shall be taken under the age of 17 years, and that they shall serve five years' time. It restricts the number of apprentices, allowing but one to each shop, and only permitting an additional apprentice when four or more journeymen plumbers are employed. After an apprentice has served four years of his time an additional apprentice will be allowed. The apprentice will be allowed to use the tools after serving three years. After his second year he shall receive not less than $1 per day less than the regular rate of wages, and the last two years of his time he shall receive the standard rate of wages.

T. P. Wenner, secretary of the Board of Control of Allentown, Pa., will receive bids until May 6 for heating and ventilating the new Sixth Ward School Building in that city, and also for heating the Franklin Building and for the extension to the heating system in the Washington Building.

Elmer Doolittle, who has been visiting the plumbing trade in the vicinity of New York for the past seven years, resigned his connection with H. H. Beals on May 1 to accept a position with E. S. Wheeler & Co. of New Haven, Conn., with branch office in New York. He will continue to visit his old friends in the trade the same as heretofore.

The Curtis & Curtis Company, 56 Garden street, Bridgeport, Conn., have arranged with H. Weiss & Co., Twenty-fifth street, New York, to handle the Forbes Patent Die Stock for cutting and threading wrought iron pipe, pipe vises, pipe cutters and other tools made by the company, so that these goods can be secured promptly in New York City. They issue a very attractive little catalogue devoted to these goods.

The members of the Southern Supply & Machinery Association, recently organized at Charleston, S. C., naturally handle a great many goods adapted for steam, water and gas, and, with a view of steering clear of any conflict with the interests of their customers, they are in correspondence with the National Committee of the Confederated Supply Associations, so that they may learn their methods and handle the Plumbing and Steam Supplies in accordance with the customs which are recognized in that branch of trade.

The steam fitter will find in the catalogue issued by Kieley & Mueller, 7 to 17 West Thirteenth street, New York City, many appliances which will simplify his work and increase the efficiency of the apparatus he may install, whether of high or low pressure. Pressure Regulators are shown, which are made both for reducing the pressure of steam carried on power boilers to the low pressure used on heating boilers, and for reducing water pressure, where the street pressure is too high for convenience in connection with plumbing systems, and also a variety of Back Pressure Valves, which will be of interest to those who install exhaust steam heating systems.

New Firms and Changes.

Thomas Whalen and Charles Gray will form a partnership in the plumbing business at Albany, N. Y.

Frank S. Lamson has opened a plumbing shop in the Higgins Building, at Bordentown, N. J.

Hough & Bond have opened a new plumbing shop in Morgantown, W. Va.

The Standard Water Still Company, Portland, Maine, have been incorporated with a capital of $10,000, to purchase patents for improving Water Stills and dealing in the same. The officers are: President, R. S. Davis; treasurer, G. W. Davis, both of Portland, Maine.

The Small Brothers Plumbing Company have been incorporated at Denver, Col., with a capital of $10,000 by James S. Small, George R. Small and R. M. Small to conduct a general plumbing business.

The General Lighting Appliance Company and the Phœnix Gas & Electric Mfg. Company, St. Louis, Mo., have consolidated as the St. Louis Brass Mfg. Company, and will shortly incorporate with a capital stock of $50,000. The company are having plans prepared for a new plant for the manufacture of Gas, Electric and Combination Fixtures, Brass and Bronze Castings, &c.

Joseph F. Shatzer has withdrawn from partnership in the plumbing firm of Trotter & Shatzer, at Altoona, Pa., and will reopen his plumbing shop at Hollidaysburg, Pa.

H. M. Porter and A. M. Bancroft have entered into a partnership in the plumbing business, at 139 State street, Springfield, Mass.

Horrigan & Co. are a new plumbing firm at 52 Mechanic street, Bradford, Pa., composed of Barney Horrigan and Will McCaffrey.

The Southern Sewer Pipe Company of Birmingham, Ala., have been organized with a capital stock of $100,000 for establishment of a large Sewer Pipe plant. The officers are: S. L. Russell, president and general manager; C. S. Bissell, vice-president and business manager; J. A. Menge of New Orleans, La., secretary-treasurer. The company have the privilege of increasing their capital stock to $200,000, and will manufacture Sewer Pipe, Tiling, Underground Conduits, Fire Proof Filing, &c.

We are informed that the old established firm of the Gleason & Bailey Mfg. Company, Seneca Falls, N. Y., have been succeeded by the Gleason-Bailey-Sciple Mfg. Company, who will be pleased to hear from the trade when in need of anything in the line of Pumps, Cast Iron Fittings, Yard Hydrants, Street Washers, Hydraulic Rams, Gas and Gasoline Engines. They call attention to their special Grey Iron Castings, which they are prepared to furnish on short notice at reasonable prices. The company are also in a position to furnish special Castings, with threads cast by a special patented process, thereby doing away with the extra expense of tapping and threading.

The Cosmopolitan Light Company of Chicago, Chicago, Ill., capitalized at $1,000,000, recently filed articles of incorporation. The company will manufacture and sell all kinds of Incandescent Mantles, Gas and Gasoline Fixtures, and other illuminating appurtenances. The incorporators are: W. S. Williams, John A. Dover, Otis James, C. N. Rudolph, Chicago, and Gardner W. Kimball of Wilmington, Del.

Pattern for Sunburst.

A New York correspondent asks us how to obtain the pattern of an article, of which he incloses a sketch, and which he thinks is called a triangular sunburst. In the diagram, which is reproduced in Fig. 1, A B C is the plan view of the sunburst and D E F the elevation on the line B C in plan. It is required that the distance N I in plan be greater than I H, and that J K L represent the section on I H, showing the pitch of the flutes. The problem, as our correspondent presents it, gives an interesting study in raking profiles and pattern drafting.

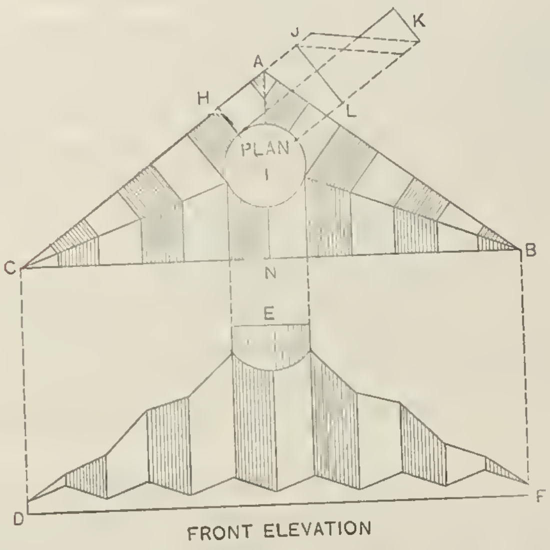

Fig. 1.—Reproduction of Correspondent's Sketch.

In Fig. 2 is shown an enlarged half plan, showing the sections and profiles and points of intersections on the pitched lines. Let A B C represent the one-half plan of sunburst and D E F the half plan of the cylinder, against which the flutes are to miter. Draw the true profile on A B in plan at pleasure, which will at once be the pattern for the closed end, as shown by H I J K.

Number each bend as shown from 1 to 8. From A in plan draw the miter line A G, intersecting the half circle D E F at E, G representing the center point from which the semicircle is struck. At right angles to A B and from the intersections 1 to 8 in the true profile draw lines, as shown, intersecting the miter line A E from 1 to 8. Draw a line from H to 3 in the true profile on A B and extend the line 2 2, intersecting the base line K J at *a* and H 3 at *b*, and call the point 2 *c*. Then will *a b c* represent the vertical hights of the flutes on the line A B in plan, which will be used in constructing a section on B G in plan, as follows:

Draw any line, as L M, parallel to B G. At right angles to B G and from B and G draw the lines L R and M P indefinitely. Take the hights *a*, *b*, *c* in the true profile and place them, starting from M, as shown by *a'*, *b'*, *c'*, thus obtaining the points M, O, P, in section. Now establish at pleasure the point R on the line L R and draw a line from R to P, and from O draw a line parallel to R P, as shown by O N. At right angles to R P draw any line, as *e f*, which will represent the depth of the flutes at right angles to the rake. Then will N O P R be the true section on B G in plan, and N R R^2 X the section of the cylinder on G F in plan. It will now be necessary to obtain a true section on the line *e f* in section, as follows: Take the distance *e f* and place it on the line A K, extended, as shown, from *e'* to *f'*. Parallel to K J and from *e'* and *f'* draw the lines *e' l* and *f' m*. At right angels to K J and from points 2, 4, 6 and 8 in the true profile drop lines, intersecting the line *e' l* at 2', 4', 6' and 8', and at right angles to K J and from points 1, 3, 5 and 7 drop lines, intersecting the line *f' m* at 1', 3' 5' and 7'. Now connect the points, as shown by the lines 1' to 2' to 3' to 4' to 5' to 6' to 7' to 8', which will represent the true profile on the line *e f* in section.

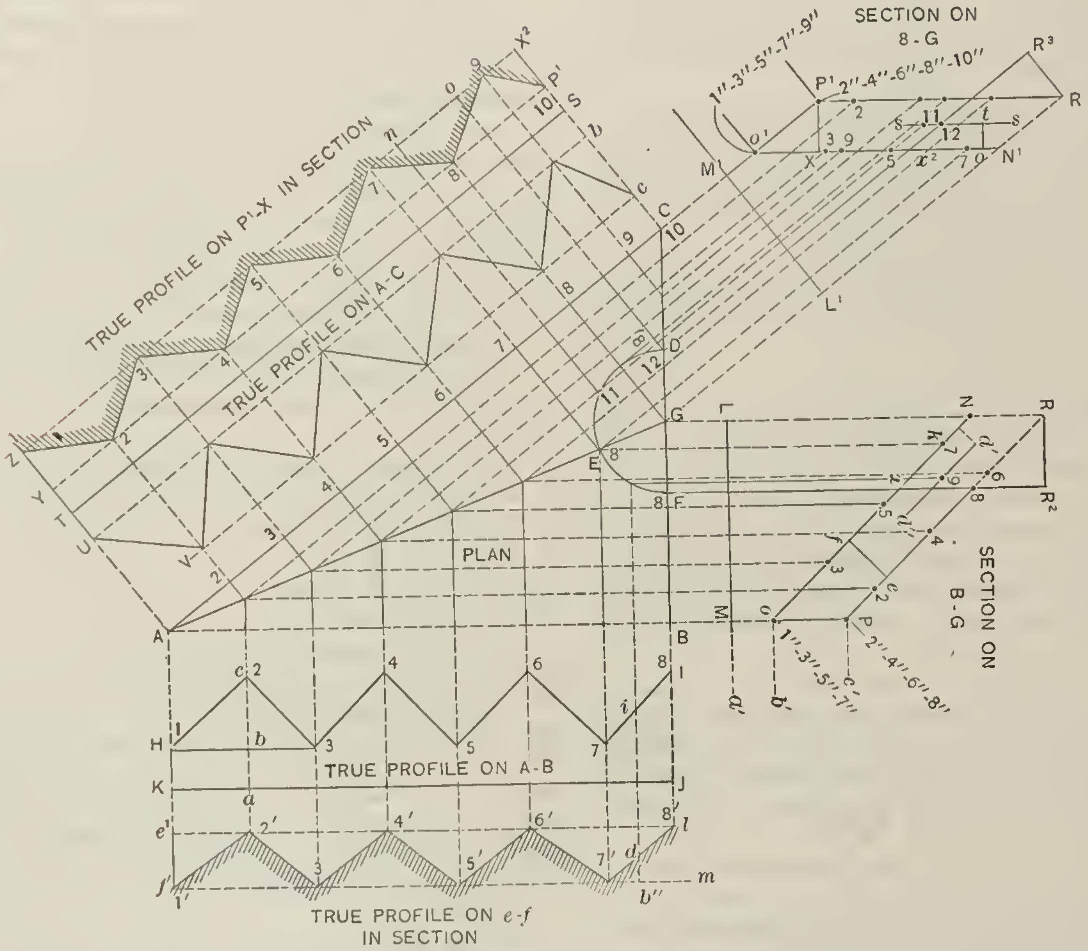

Fig. 2.—Enlarged Half Plan, Sections and Profiles.

PATTERN FOR SUNBURST.

As the line R P in section represents the points shown in the profile having even numbers, as 2', 4', 6', 8', and the line N O in section represents the points shown in profile having uneven numbers, as 1', 3', 5' and 7', then, at right angles to G B in plan and from points 2, 4, 6 and 8 on the miter line in plan, erect lines, intersecting the line R P in section, as shown by points 2, 4, 6 and 8. In similar manner, at right angles to G B and from points 1, 3, 5 and 7 on the miter line in plan erect lines, intersecting the line N O in section at points 1, 3, 5 and 7. Now, at pleasure, between the arc E F in plan, establish the point 9, and parallel to F B drop a line, intersecting the true profiles at i and d and the line $f'\,m$ at b''. Take the distance from b'' to d and place it at right angles to N O in section, as shown by K d'. From d', parallel to N O, draw a short line, as shown by $d'\,d''$, which intersect by a line drawn from the point 9 in plan at right angles to G B, thus obtaining the point 9 on the line $d'\,d''$ in section. As P O in section represents the vertical cut through the flutes, then will P represent the even numbers in profile, as shown by 2″, 4″, 6″ and 8″, and O the uneven numbers, as 1″, 3″, 5″ and 7″. Having obtained the points of intersections on the section, the pattern is developed as shown in Fig. 3, in which R P O N, with the various points of intersection on same, is a reproduction of R P O N in section in Fig. 2 with the various intersections.

section on B G and place them, as shown, from L^1 to N^1 R^1 in the section on 8 G. In similar manner take the hights from M to O to P in the section on B G and place them in the section on 8 G, as shown, from M^1 to O^1 to P^1. Now draw a line from R^1 to P^1 and from N^1 to O^1. Then will N^1 O^1 P^1 R^1 be the true section on 8 G in plan and N^1 R^1 R^3 X^1 the section of the cylinder on '8 G in plan.

From the point P^1, at right angles to P^1 R^1, draw the line P^1 X, which gives the depth of the flutes at right angles to the rake. At right angles to A C in plan and from the various intersections from 1 to 7 on the miter line draw lines, intersecting the line A C from 1 to 7. Set the dividers equal to one of these spaces and step off on A C, 7 to 8, 8 to 9, and let 9 to 10 be as it may. Then, at right angles to A C and from the intersections 1 to 10 on A C draw dotted lines indefinitely, as shown.

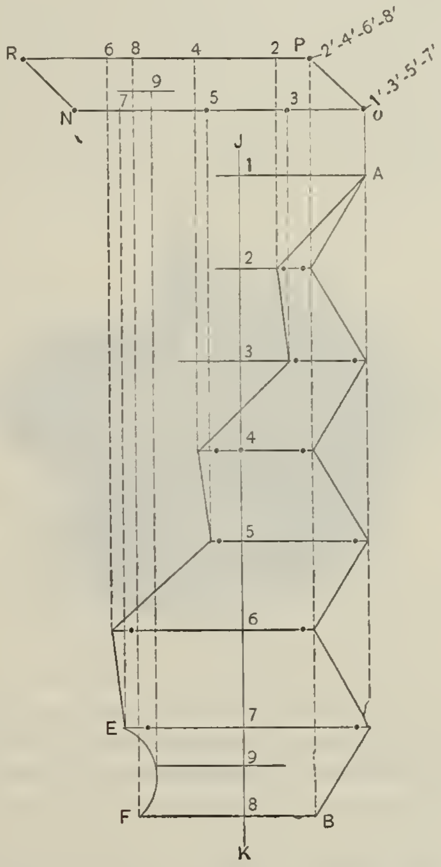

Fig. 3.—Pattern for A E F B of the Plan, Fig. 1.

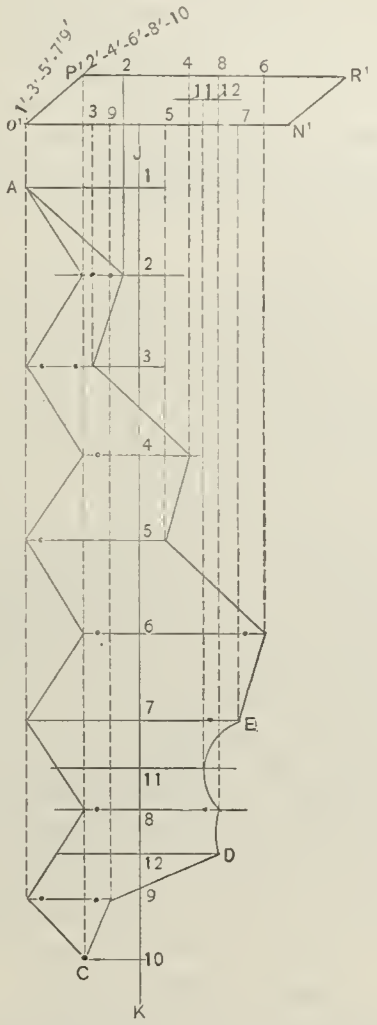

Fig. 4.—Pattern for A C D E of the Plan.

PATTERN FOR SUNBURST.

At right angles to R P in Fig. 3 draw the line J K, upon which place the stretchout of the true profile on $e\,f$ in section in Fig. 2, as shown by the small figures 1, 2, 3, 4, 5, 6, 7, 9, 8 on the line J K in Fig. 3. At right angles to J K and through these small figures draw lines indefinitely, as shown, which intersect with lines drawn at right angles to R P from intersections having similar numbers, as shown in R P O N. A line traced through points of intersection thus obtained, as shown by A B F E, will be the pattern for A B F E in plan in Fig. 2, formed after the profile $f'\,l$, while the true profile on A B will be the pattern for the vertical face of the flutes shown by P O in the section.

As the distance 8 G at right angles to A C in plan is less than G B, it will be necessary to construct a true section on 8 G in plan from which to obtain the true profiles necessary to form a miter with the opposite flutes on the line A E in plan. Therefore, parallel to 8 G draw the line M^1 L^1, and at right angles to 8 G and from points 8 and G erect the lines G R^1 and 8 P^1 indefinitely, as shown, intersecting the line M^1 L^1 at M^1 and L^1. Now take the hights from L to N to R in the

At pleasure draw any line, as S T, parallel to C A. Now take the hights from M^1 to O^1 to P^1 in the section and place them at right angles to S T, as shown by S b c. From b and c, parallel to S T, draw the lines b U and c V, letting b U, which represents the bottom line of the flutes, intersect the lines drawn from uneven numbers, as 1, 3, 5, 7 and 9, and the line c V intersect lines drawn from even numbers, as shown by 2, 4, 6, 8 and 10. Trace a line through points thus obtained; then will T U V c b S be the true profile on the line A C in plan, shown in section by O^1 P^1, and will at once be the pattern for the vertical bottom or head to close the ends of the flutes on the line A C in plan.

For the true profile on P^1 X in section draw any line parallel to C A in plan, as X^2 Z. Take the distance from X to P^1 in the section and place it, as shown, from X^2 to P^1, at right angles to Z X^2. From P^1 draw a line parallel to X^2 Z, as shown by P^1 Y. As X^2 Z represents the bottom of the flutes, then must this line intersect uneven numbered lines, as 1, 3, 5, 7 and 9, and the line P^1 Y intersect even numbered lines, as 2, 4, 6, 8 and 10. Draw lines connecting these numbers, as shown by the shaded lines 1 to 10; then will Z P^1 be the true profile on P^1 X in section. As the line P^1 R^1 in section represents the points shown in the profile Z P^1 having even numbers, as 2, 4, 6, 8 and 10, and the line N^1 O^1 in section represents the points shown in profile Z P^1 having uneven numbers, as 1, 3, 5, 7 and 9, then, at right angles to 8 G in plan and from points 2, 4, 6 and 8 on the miter line erect lines, intersecting the line R^1 P^1 in section, as shown by points 2, 4, 6 and 8. In similar manner, at right angles to 8 G in plan and from points 1, 3, 5, 7 and 9 on the miter line in plan erect lines, intersecting the line N^1 O^1 in section at points 1, 3, 5, 7 and 9. Now, at pleasure, on the arc E D establish any point, as 11, and call the point D 12. From the points 11 and 12 and parallel to 8 G draw lines, intersecting the true profile Z P^1 at 11 and 12 and the base line X^2 Z at *n* and *o*. Take the distances *n* 11 and *o* 12, which in this case are equal, and place them at right angles to N^1 O^1 in section, as shown by *o t*. Through *t*, parallel to N^1 O^1, draw a short line, as shown by S S, which intersect by lines drawn from points 11 and 12 in plan at right angles to 8 G, thus obtaining the points 11 and 12 on the line S S in the section. As P^1 O^1 in the section represents the vertical cut through the flutes, then will P^1 represent the even numbers in the profile, as shown by 2" to 10", and O^1 the uneven numbers, as 1" to 9".

Having all the points of intersections on the section, the pattern is obtained as shown in Fig. 4, in which R^1 P^1 O^1 N^1, with the various points of intersection on same, is a reproduction of R^1 P^1 O^1 N^1 in section in Fig. 2 having similar intersections. At right angles to R^1 P^1 in Fig. 4 draw the line J K, upon which place the stretchout of the true profile on P^1 X in section in Fig. 2, as shown by the small figures 1, 2, 3, 4, 5, 6, 7, 11, 8, 12, 9, 10 on the line J K in Fig. 4. At right angles to J K and through these small figures draw lines indefinitely, as shown, which intersect with lines drawn at right angles to R^1 P^1 from intersections having similar numbers in R^1 P^1 O^1 N^1. A line traced through points of intersections thus obtained, as shown by A C D E, will be the pattern for A C D E in plan in Fig. 2, formed after the profile Z P^1. It should be understood that the two patterns in Figs. 3 and 4 represent the half panel or sunburst, therefore there must be two of each pattern cut, one formed right and the other left. The pattern for the cylinder is not necessary, as that is made the same as a tube and slipped inside the circular opening of the sunburst.

New Tin Plate Plant.

L. C. McFatridge, Henry Rhodes, Jack Hobbs and others of Atlanta, Ind., are organizing the Atlanta Rolling Mill & Tin Plate Company for the purpose of reestablishing the tin plate industry in the Atlanta Steel & Tin Plate plant, recently dismantled by the American Tin Plate Company. They have in hand a bonus of $25,000 from the city, and have received subscriptions for $75,000 worth of stock. It is their intention to incorporate the company with a capital stock of $150,000 and to install a modern four-mill plant at first, which will later be increased to six mills. The power plant will comprise 1000 horse-power of engines and boilers. No equipment has as yet been purchased. Address communications to L. C. McFatridge.

Master Coppersmiths' Club.

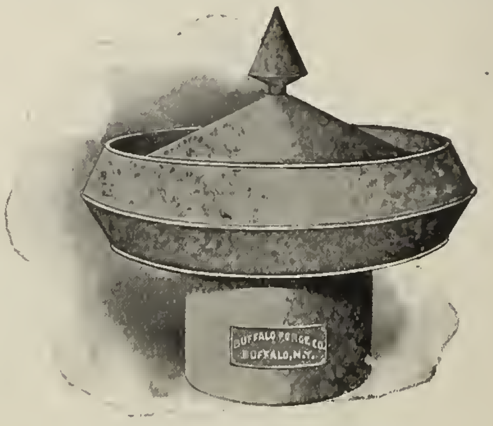
For some time past the master coppersmiths and journeymen in their employ have been conferring for the purpose of improving trade conditions. The former have recently completed the organization of the Master Coppersmiths' Club of New York and vicinity, having for its object the protection of the interests of those engaged in this branch of business and the provision of a body with whom the journeymen can confer. The new body has already been successful in arriving at a satisfactory arrangement with the journeymen, fixing a rate of wages, the hours constituting a day and the payment for overtime. Already most of the largest shops in New York City, Brooklyn and Jersey City have become members of the organization, and the Advisory Committee are engaged upon the work of informing those who have not joined the organization of its object for the purpose of securing their membership. The officers are as follows:

President, Charles Roos.
Vice-President, A. F. Trageser.
Treasurer, William S. Flynn.
Secretary, Charles W. Woodward.

The Advisory Committee is composed of Charles A. Roos and P. H. Carney of New York, T. J. Daudt, Jersey City, and Frank E. Clarke of Brooklyn.

The Buffalo Improved Ventilator.

During their quarter of a century of experience in the heating and ventilating of buildings of all classes the Buffalo Forge Company of Buffalo, N. Y., have become thoroughly in touch with the conditions which make stationary ventilators an efficient and serviceable help. Their value when in use with the fan system is too often underestimated. In certain cases they are alone amply sufficient for proper ventilation. While the requirements of a stationary ventilator are hard to fulfill, they have been met by the new Buffalo improved ventilator, which the company recently placed upon the market. These ventilators provide a free exit for the impure air in the building, but effectually retard and prevent the air from re-entering the building through the ventilator.



The Buffalo Improved Ventilator.

With the movement of air across the head of the ventilator there is a suction produced which actually draws the air from the room. This sucking action is obtained because of the shape and construction of the ventilator head.

These ventilators are built of heavy galvanized iron and will resist any reasonable strain that may come upon them. They are perfectly silent in their work and do not require the expenditure of available power, which in some instances means a considerable outlay of money each week. Many buildings need both light and ventilation. Where such conditions are met with the ventilator is specially constructed with a glass top head. It loses none of its good qualities as a ventilator, but has the additional quality of supplying light. These special ventilators may be constructed either of copper, brass or steel plate, or they may be made of the regular material and lined with pure lead to protect the ventilator when used to exhaust obnoxious gases or other injurious fumes.

These ventilators are also used to prevent down drafts and smoky chimneys. The usual method of applying these ventilators to a chimney is with the outside flange, which forms a splendid protection for the top of the chimney. It is a rigid and desirable method of fastening.

The Jackson Iron & Tin Plate Company, Clarksburg, W. Va., have filed a deed of trust covering all their property to Willard F. Snyder and John W. Davis, as trustees, to secure bonds for $125,000 for working capital and for the purpose of making certain new improvements. The erection of the company's plant is proceeding rapidly, and it will be ready for business in a few weeks.

THE AMALGAMATED ASSOCIATION.

At the meeting of the convention of the Amalgamated Association in Wheeling, W. Va., on Monday, the entire wage scale, as reported by the Wage Committee, was ratified with a few very slight alterations. The consideration of the report is said to have been harmonious and it is the first time in the history of the association that this important matter was disposed of in one day. This is claimed to demonstrate that the action of President Shaffer in coming to an advance agreement with the American Tin Plate Company, the American Sheet Steel Company and the Republic Iron & Steel Company was acceptable to the great majority of the delegates. The ratification of the scales is regarded as a distinct victory for President Shaffer and his policy. The new wage scales as ratified are practically the same as those effective last year. They will be in force until July 1, 1903. No conference with the manufacturers will be necessary after the convention. The scale with the independent mills will be signed by the various district vice-presidents of the association.

On Tuesday the convention, with a few dissenting voices, indorsed the annual report of President Shaffer, which contained a detailed history and defence of last year's strike. The reports of the various officers were also approved, after which the convention went into executive session. No further report of its proceedings has been given out up to the time of going to press. It is understood, however, that a prolonged discussion was held on the report of the Committee on Constitution and General Laws, the subject of a change in the present system of assessments being, apparently, the most important feature discussed.

On Thursday the convention re-elected Theodore J. Shaffer as president, together with the other National officers. Assistant Secretary M. F. Tighe, who was spoken of as a candidate for the presidency, declined the honor, preferring re-election to his former position.

Milwaukee Corrugating Company's New Catalogue.

The Milwaukee Corrugating Company, Milwaukee, Wis., who have just established a new factory, have issued their first annual catalogue. This publication, unlike the first attempt of most manufacturers, is an exceedingly creditable presentation of the products which the company are placing on the market. It comprises over 200 pages, its illustrations are exceptionally fine and the variety of the contents is unusually large. The catalogue is divided into three parts. The first part covers eaves trough, conductor pipe, eaves trough hangers, valleys, ridge coverings, cut offs, crestings, roofing plates, bright plates, coke plates and continuous roofing tin. The second part treats of cornices, letters, gable ornaments, window and door caps, hip caps, ceilings, cresting blocks and finials, galvanized iron skylights, ornamental conductor heads, &c. The third part relates to steel roofing in all styles, corrugated weather board, siding, iron doors and shutters, metal shingles, roof paints, &c. It will thus be observed that this catalogue covers a wide range of products for the use of roofers, cornice makers and others who use sheet metal in the construction or decoration of buildings. The company's manager is Louis Kuehn, who had long experience in the same branch of business at La Crosse, Wis. Mr. Kuehn is president and treasurer of the new company, J. J. Heggy is vice-president and William P. Jahn is secretary.

Sheet Metal Machinery Catalogue.

The Cincinnati Punch & Shear Company, Cincinnati, Ohio, have issued from the press a 48-page illustrated catalogue of their metal working machinery. The company, who are successors to the Wais & Roos Punch & Shear Company, make a long line of punching machines, coping machines, multiple punches, shears, bending and straightening rolls, sheet crimpers and rolling mill and tin mill machinery. Their bending machines are made from the smallest to the largest sizes and from the shortest to the deepest throats. They are furnished either single or double throat and for belt, engine or motor driven power. The present catalogue shows 25 varieties of punching machines, also geared power punch shears, specially constructed for range and furnace makers. The company also build a variety of plate, pack and sheet shears to shear from the lightest gauge sheet up to a plate 1-inch thick, and from 36 inches up to 10 feet wide. Bending rolls, doublers, straighteners and crimping rolls occupy the last pages of the catalogue.

An illustration shows the company's new combined tin plate shear and doubler, which has lately been introduced to the trade. This machine is compact and requires a minimum of floor space. It has the engine and gearing above out of the way, so that no sand or dirt can get into the working parts. The shear and doubler may be operated together or independently of each other. The shear is 36 inches wide and is adapted to cut backs and trim plates. The doubler is driven by a crank from the same shaft that operates the shear. It has an opening 28 inches wide and about 8 inches lift. The Cincinnati Punch & Shear Company will gladly furnish a copy of this catalogue, on request, to any who are interested in the machines.

THE ROOFING SLATE TRADE.

John Galt & Sons, manufacturers and dealers in roofing slate, 253 Broadway, New York, report the market for this product much more active than for a long time past. The demand from all parts of the country is of unusually large valume, while the available stocks at quarries are phenomenonally light. Owing to a number of untoward conditions in the past winter, the mining of slate was interrupted to a wider extent than usual, and some of the quarries are only now getting into full work again. As the stocks in hand at the close of last season were by no means large, the result has been a distinct shortage at the present time in the supply of certain kinds of roofing slate. All the quarries are reported to be from three weeks to three months behind on their orders, and consumers, in some cases, are becoming inconvenienced through inability to obtain supplies.

In the Central West a number of buildings, which were started in the fall and work on which was stopped during the winter months, are now reaching the roofing stage, and as a large proportion of buildings in that district are roofed with slate, the demand from that quarter is especially pressing. The large bulk of roofing slate is used in the Central and Central Western States, but an increased demand for slates for roofing purposes is also noted in the Eastern part of the country. The outlook indicates a very large increase in the consumption of this material during the present year, which promises to overtax the facilities of the manufacturers. Already orders are in hand which will entirely absorb the output of some of the quarries for the present year. Prices, in consequence, have stiffened materially and rule considerably higher than at this time last year. It is expected that a further advance will be made by July 1. Under the conditions above outlined it is not surprising to find that the exports of roofing slate have fallen off to an almost insignificant point. This is caused not so much by a lack of demand from abroad, but from the fact that practically the whole of this year's output of American roofing slate will be required at home.

FLASHINGS.

The officers of the new Vulcan Detinning Company, incorporated last week under the laws of the State of New Jersey with a capital of $3,500,000, are: President, Joseph B. Bloomingdale; vice-president, Steven Ginna; secretary, Meyer Hecht, and general manager, Adolph Kern. As stated in our last week's issue, the new company have acquired the plants of the Vulcan Metal Refining Company, at Sewaren, N. J., and the Vulcan Western Company, at Streator, Ill. The capital of the company will be divided into $1,500,000 of 7 per cent. preferred stock and $2,000,000 common stock.

The Southern Metal Company, Orangeburg, S. C., who were incorporated and began business on February 15 last, are now manufacturing tin goods and a general line of sheet metal work. The company's factory is equipped to manufacture Cornices, Skylights and a patent Eaves Trough Hanger, the invention of their manager, J. B. Outland, and they are also preparing to manufacture Steel Ceilings. They are having four sizes of dies made by the E. W. Bliss Company of Brooklyn, N. Y., for the manufacture of the Seeder Cups which accompany the Hoffman Universal Seeder, of which they are the sole manufacturers. The company report having met with a good business since their start. Among the recent contracts booked is one for 3000 of the Hoffman Universal Seeders. The company are prepared to undertake all kinds of special work in sheet metals, also light wrought iron work. The officers of the concern are Dr. W. S. Barton, president; Dr. D. Hydrick, secretary and treasurer, and J. B. Outland, manager.

The Niles Iron & Steel Roofing Company, Niles, Ohio, will remove their plant from its present location to a site adjoining the plant of the Niles Mine & Mill Supply Company. The company will be provided with a considerable extension of capacity at their new location. A one-story building, 72 x 200 feet, is being constructed and will be ready for occupation within 90 days.

Herman Blevins of New Castle, Pa., has severed his connection with the American Tin Plate Company and will have charge of the electrical machinery at the New Castle Stamping Company's works, New Castle, Pa.

G. Bickelhaupt's Skylight Works, 243-245 West Forty-seventh street, New York City, are distributing a folder calling attention to the patent Automatic Self-locking Scuttle Opener which they manufacture. This Opener is made of wrought and malleable iron, in such a way as not to get out of order, and can be placed on skylights already in position without requiring any alterations. The Skylight Opener is referred to as safe and as affording a means of quick escape in case of fire.

The engine room and pickling department of the Monongahela Works of the American Tin Plate Company, at Pittsburgh, Pa., were recently damaged by fire to the extent of $5000.

The Marietta Sheet & Tin Plate Company of Marietta, Ohio, have awarded the contract for the erection of their sheet mills to the Wheeling Mold & Foundry Company of Wheeling, W. Va. The contract calls for four hot and four cold mills and six shears. At a meeting of the company, held at Marietta last week, the following officers were elected: President, J. M. Ickes; secretary, L. C. Taylor; treasurer, R. Park; superintendent, D. Lewis, and engineer, E. E. Erikson of Pittsburgh.

The American Sheet Steel Company have placed an order with the Bass Foundry & Machine Company of Fort Wayne, Ind., for a 30 x 48 heavy duty rolling mill engine for their plant at McKeesport, Pa. The Bass Company are also building a cross compound condensing Corliss engine for the Laughlin Works of the American Tin Plate Company, at Martin's Ferry, Ohio.

Beyer Bros. Company of Philadelphia have prepared an attractive catalogue and price-list covering their Tinners' and Roofers' Supplies.

W. C. Dickey left the New York office of the Cambria Steel Company on May 1 to assume the duties as secretary of the Maryland Sheet & Steel Company of Cumberland, Md. He will be the Eastern sales agent of the company, with headquarters at 1133 Broadway. The company produce Blue Annealed Open Hearth Sheets from Nos. 7 to 20 gauge, Harrow Disks and Circles.

The report that two more Sheet mills will be built at the Falcon Works of the American Sheet Steel Company, at Niles. Ohio, is untrue. No additions are contemplated at this plant for the present.

The offices of F. H. Phillips & Sons Company, Sheet and Tin Mills, Chilled Rolls, &c., have been removed from the Schmidt Building to room 721 Park Building, Pittsburgh. The office is under the charge of F. Rees Phillips.

The new Sheet plant of the Ashland Sheet Mill Company, Incorporated, at Ashland, Ky., manufacturers of Black and Galvanized Iron and Steel Sheets, is now in full operation and started off in splendid shape. The main building is 420 feet long and 100 feet wide. The plant contains six Sheet mills, six pair and six annealing furnaces. I. A. Kelly is president, T. J. McCullough, vice-president; L. R. Putnam, secretary and Geo. McCullough, treasurer.

The New Doty Mfg. Company, Janesville, Wis., have orders on their books for a large amount of business in Punches, Shears and Rolls, all that they can do for some months ahead. Inquiries are numerous and there is every indication of a continued good business for the balance of the year or even longer. The only trouble is to get out goods soon enough to please customers. They are about to begin work on some extensions to their plant, a pattern storage room, 30 x 70 feet, three stories high, a new pattern shop and an extension to their machine shop of about 60 x 70 feet.

The Van Noorden Company, Boston, Mass., have issued a pamphlet devoted to illustrations of the constructive features of their Metal Skylights, in connection with a description of their points of excellence.

The Gerock Bros. Mfg. Company, 1252 Manchester avenue, St. Louis, have just made of sheet copper a large eagle, measuring 15 feet from tip to tip of wings, which is intended to adorn the Mississippi State Building at Jackson, Miss. Its perch is to be a distance of 200 feet from the ground, but its generous proportions will make it plainly and prominently obserable from a considerable distance. The plans were prepared by the State supervising architect. In addition to this special work the concern are doing a very large business in all departments of Cornice and Ornamental Sheet Metal Work, and have recently found it necessary to enlarge their plant and add additional machinery.

W. S. Baertich proprietor of the Eagle Cornice Works, Fort Worth, Texas, informs us that he is in the market for supplies from jobbers and especially dealers in Furnaces.

H. Weiss & Co., 25 Cliff street, New York, report more activity in the movement of Tools for tin roofers and cornicemen. They make a specialty of all kinds of Tin and Sheet Metal Working Tools and Machinery, which they carry in stock and are prepared to ship promptly.

Employees in the plants of the American Can Company in Boston, Mass., to the number of over 300, struck work this week over a question of the hours of labor.

The extensive Sheet plant of Zug & Co., Limited, Pittsburgh, Pa., has been running full in all departments for some time past, with every prospect of an indefinite continuance of present activity.

John F. Murphy, who for the past four years has looked after the Ohio business of the Follansbee Brothers Company, with headquarters at Columbus, Ohio, has been appointed manager of their Philadelphia office, covering the territory of New Jersey, Eastern Pennsylvania, Delaware, Virginia, Maryland, Vermont and a portion of New York State.

The Provident Slate Company, Slatington, Pa., have sent out to the trade, under date of April 15, a new price-list on the grades of Roofing Slate which they manufacture. The company state that they have a fair sized stock on hand and are in position to take care of orders for Washington Bangor Slates, but on other grades, such as Old Washington, Standard Washington and Pennsylvania Black, they are sold ahead on many sizes. The company call attention to the fact that they carry a large line of Felt, Nails, Dressers, Tools, Cement and other supplies for Slate roofers.

Follansbee Brothers Company of Pittsburgh, Pa., have awarded the contract for four hot and one cold sheet mills, one roughing mill and four hot and five cold tin mills to the Wheeling Mold & Foundry Company, Wheeling, W. Va. These mills will be installed in the company's new Sheet and Tin Plate works.

The Executive Committee of the National Blast Furnace Workers, embracing blast furnace labor in the Mahoning and Shenango valleys, have decided to extend the date of demanding an eight-hour day to June 1 instead of May 1. It is stated that this demand will be vigorously opposed by the blast furnace operators and it is not believed it will ever go into effect.

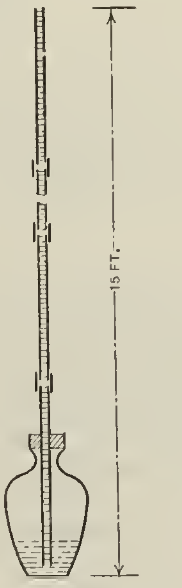
THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WHAT MAKES THE TORCH BLOW?

From Curiosity, Philadelphia, Pa.—I thank *The Metal Worker* and "B. McK." for the reply concerning blowing of torches, which was as close to the actual facts as it is possible to get. I found that the heat of the human hand on the torches caused the gas or air in the upper portion of the torch to expand to such an extent that the alcohol was driven up through the wick. The smaller the space in the torch the greater the expansion. It may interest your readers to learn that, in experimenting on the expansion of air by the heat of the human hand, I made a pint flask air tight and placed a small glass tube through the cork, after placing water in the flask to the depth of an inch. The glass tube was extended to a hight of 15 feet above the flask. I found no trouble in forcing the water that hight by the heat of the hands on the outside of the flask. A few drops of red ink in the water makes it more easy to follow in the glass tube.



THE METAL WORKER

What Makes the Torch Blow?

A DISPUTED BILL

From T. M., Philadelphia, Pa.—Having read the communication of "J. B." in *The Metal Worker* of April 26, I am of the opinion that "J. B." should be paid for his work. If he can establish the facts in a court, there is no doubt that he could collect, but I would advise him to avoid spending any money in the courts and rather make some concessions to settle the matter outside. I hope many of the readers of *The Metal Worker* will read his letter carefully, and note how easy it is to get into trouble by not being very careful to note down orders in detail, so as to avoid just such complications. People who are the easiest to get along with and who give a general order in a careless fashion are the people who make you the most trouble when things go different from what they expect. It is better to be overcareful in every instance. Men who guide the affairs of large institutions are those who are the most careful over the smallest things.

From J. S., Chicago, Ill.—Having read the letter of 'J. B." in *The Metal Worker* of April 26, I first must express my regret at the unfortunate condition in which he finds himself, and which overtakes the best people on some occasions. If "J. B." can establish the fact that the order was given for a hood 6 feet 6 inches in diameter on the outside for a smoke stack 30 5-16 inches in diameter and that such a hood was made and delivered, it would seem to me that the only man to blame is the one who gave the order, in not ordering what he wanted, or explaining the conditions to be met. Consequently "J. B." ought not to be expected to make changes at his own expense. The original bill should be paid, as should also the expense of any changes that may be necessary to make the hood satisfactory.

PATTERN FOR A SIX-POINTED STAR.

From J. O., New York.—Will you please tell me through *The Metal Worker* how to lay out the pattern for a six-pointed star?

Answer.—In Fig. 1 is shown a reproduction of our correspondent's sketch, in which A B C D E F G is the elevation and N O P the true section on the line L I in the elevation. A true section will also be necessary on the line M A in the elevation. Take the distance M A and place it as shown from M^1 to A^1, and draw a line from A^1 to O, which is the true length on M A in elevation. For the pattern proceed as follows: Draw any line on Fig. 2, as A M, equal to A^1 O in Fig. 1. Now with radii equal to A G or A H and with A in Fig. 2 as a center describe the arcs G and H. Then with O P in Fig. 1 as radius and M in Fig. 2 as center intersect the arcs G and H at G and H. Draw lines from M to G to A to H to M, which will be the pattern for one point of the star. If the pattern is desired in one piece join six of these points, as shown by D E F A B C, and bend on the lines shown to fit the outline in elevation.

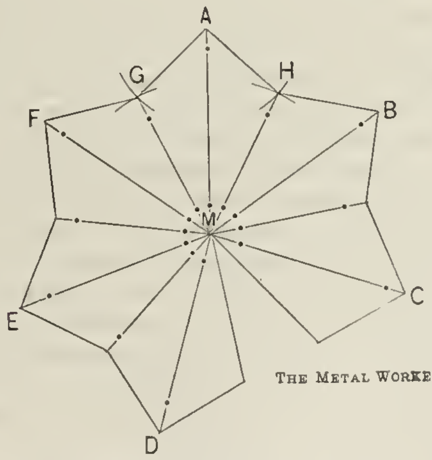
Pattern for a Six-Pointed Star.—Fig. 1.—Elevation and Sections.



THE METAL WORKER

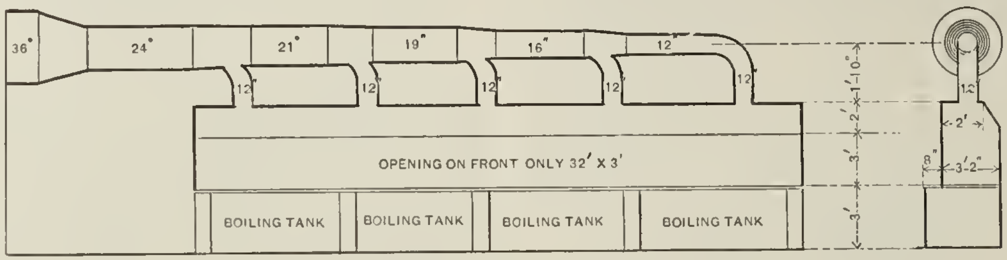
Fig. 2.—The Pattern Shape.

CAN RUSTY CANS BE SOLDERED?

From M. J. S. & Co., Houston, Texas.—We would be glad to have some of the readers of *The Metal Worker* describe their method of cleaning and soldering rusty iron ice cans.

REMOVING STEAM BY FAN.

From J. M., Canandaigua, N. Y.—I notice the sketch and letter of "J. W. N." in *The Metal Worker* of April 12 and inclose a sketch showing my method of removing steam from boiling vats. I have had considerable experience in the work of removing steam from tanks of boiling water, potash and acid, and have secured success every time. I have seen a great many failures, as the rising steam does not go where you want it to go, but where you make it go. As the sketch may need some explanation, I give the following: If the boiling liquids are not acid, the hood and pipes may be made of galvanized iron, using No. 20 iron for the hood and No. 24 iron for the pipes, which should be well riveted and soldered. Where the work will permit it the opening should be on the front side of the tanks only, and the hood should not only be strengthened up the back, but also on the front edge at the bottom, with 1-inch angle iron. If acid is to be used in any of the tanks the hood and pipe should be made of wood. It will be noticed, in the elevation I present, that the front of the hood sets back 8 inches from the front of the tank, so that the workman may more easily reach his work without any hindrance. If the hood has one opening on the front there would be draft enough through the front to remove the steam, as all the air handled by the fan will have to pass through the space. Some benefit will be derived if it is possible to reduce the hight of the opening from the 3 feet to just enough hight to allow the largest work to pass through easily. It will be seen that I use five 12-inch pipes in place of six, instead of arranging the sizes of the pipe as "J. W. N." has done. The area of a 24-inch pipe is of sufficient capacity to take care of 5.7 12-inch pipes, and the pressure will be the same at each opening, so I use five pipes instead of six pipes. The elbows connecting the branches into the main would have not less than a 12-inch radius on their shorter side, and the main should be increased in size as the branches connect into it.



THE METAL WORKER

Removing Steam by Fan.

If the plan I suggest is followed I am positive that "J. W. N." will have nothing to change, and the result will be in every way satisfactory. He does not make it clear whether he uses a disk fan or an exhaust fan. If a 36-inch disk fan is run at the speed he mentions it will do the work and at a small expenditure of power—about 3 horse-power—but an exhaust fan would use two or three times as much power without giving any better results, as it is a volume of steam laden air that has to be moved, and not a small quantity at a high velocity, and the disk fan is better adapted to the work. I hope "J. W. N." will think favorably of this layout, and if he adopts it I shall be pleased to hear from him and to make anything more clear that he does not understand from my letter. I think many readers of *The Metal Worker* will be glad to learn what success attends his efforts, whatever plan he may follow.

WHAT WILL REMOVE THE SOOT?

From Detroit Heating & Lighting Company, Detroit, Mich.—In reply to the inquiry of "C. H. R.," in *The Metal Worker* of April 26, as to how to remove sticky substance from the surfaces of his heater, we would suggest that if he will get up a good hot coal fire, and when the coals are bright take a handful or two of zinc chips and a like quantity of sulphur, scattering these over the top of the coals, and closing the heater and leaving the damper in the smoke pipe partly open, letting it burn a while, he will find that the substance will scale off the heater,

WHO MAKES THE BOSTON GAS RANGE?

From M. Thompson, 88 Remsen street, Cohoes, N. Y.—I should be glad to learn who makes a two burner gas range called the Boston.

Chapman Forges and Emery Grinding Machine.

H. L. Chapman, Marcellus, Mich., is taking special measures to bring the Chapman portable forges before the trade. These forges are classified under numbers. No. 1, with hood, is designed for heavy smithing; No. 2, with shield, for outdoor work, and No. 3 forge, with hood, for 7-inch pipe. A strong point in favor of these forges is claimed to be their extreme simplicity of construction, compact form, great strength and durability. The manufacturer is so confident of the product that he guarantees the forge to work and to be equal in every respect to representations made in his trade circular, and should any piece prove defective in material or workmanship it will be duplicated within one year from date of sale. Mr. Chapman has also issued a circular setting forth the merits of the Chapman foot power emery grinding machine. The aim of the manufacturer is to make a light machine yet strong, durable and thoroughly practical in the hands of the ordinary mechanic. The new machine was thoroughly tested before being put upon the market. The size of the machine on the floor is 16 x 24 inches; hight to top of table, 38 inches. The table is of hard wood, 15 x 22 inches. The frame is of cast iron, well braced; the fly wheel is 19½ inches in diameter, carries 1¼-inch belt, weighs nearly 40 pounds and makes from 200 to 250 turns per minute, giving a strong, steady motion. Weight of machine complete with head is about 120 pounds; shipping weight crated, 130 pounds.

What is claimed to be the largest anchor ever forged has recently been turned out at the Government forging shop, at the United States Navy Yard, Charleston, S. C. It weighs 26,500 pounds and the cost of the material and construction was nearly $2000. The great anchor is to form part of the equipment of one of the new United States battle ships. The forging of this anchor was somewhat of an experiment, as it was doubted whether an anchor of such a size could be forged. Many large anchors have been made of cast steel, which are now in use in some of the war vessels of the United States and British navies; but cast steel is always liable to fracture and it was desired that an anchor should be provided that, while of no greater weight than the cast steel, would be tougher and less liable to breakage. The result of the experiment has been entirely successful. The production of the anchor took the work of five men for over a month in hammering, smelting and welding.

According to the statistics of the American Iron & Steel Association the production of steel wire nails in the United States in 1901 amounted to 9,803,822 kegs of 100 pounds, as compared with 7,233,979 kegs in 1900, an increase of 2,569,843 kegs, or over 35 per cent. In 1899 the production amounted to 7,618,130 kegs, in 1898 to 7,418,475 kegs, in 1897 to 8,997,245 kegs, in 1896 to 4,719,860 kegs, and in 1895 to 5,841,403 kegs. The wire nails produced in 1901 were manufactured by 61 works, as compared with 56 in 1900. The production in 1901 was greatly in excess of that of any other year, exceeding by 906.577 kegs that of 1897, the next year of largest production.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is about ½c. higher in price, but quiet.

Copper is dull and weak.

Pig Lead is quiet and firm.

Spelter is about 1-10c. higher and quiet.

Antimony is unchanged.

Nickel is active and without change.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged and firm.

Sheets continue in heavy demand: prices strong, with upward tendency.

Old Metals are quiet and weaker, especially Scrap Brass and Copper.

Foundry Iron is still very scarce, with prices high and little doing for lack of supply.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume and prices remain strong.

Plumbers' Supplies are active, with prices firm in all lines.

Galvanized Range Boiler prices have been withdrawn and an early advance is looked for.

Cast and Malleable Iron Steam Fittings are likely to advance 10 per cent. in price.

Copper Boilers, Sinks, &c., are expected to show an advance at early date.

Roofing Slates were advanced in price April 25.

Sad Irons have been marked up ⅛c. a lb.

Wire Nails are firm and in good demand.

Cut Nails are moving in large volume at firm prices.

Window Glass has been advanced in price by jobbers.

White Lead is in active demand; prices are unchanged.

Linseed Oil is quiet and firm.

Spirits Turpentine is firm and fairly active.

Old Rubber is quiet and without change.

METAL MARKET.

New York, May 2, 1902.

Pig Tin.—After considerable fluctuation, prices of Tin are again on a higher level, the market this week having reached the highest point since the decline which set in two weeks ago. At the close the market, although quiet, was strong. Jobbers quote Straits Pig in small lots at 29½c. to 30c. per lb. The statistics for the month of April were regarded as favorable to the maintenance of the present high level of prices. The total arrivals at Atlantic ports during the month were large, aggregating 3834 tons. Deliveries into consumption for the month were the heaviest on record, amounting to 3300 tons, and the stock on April 30 was 2990 tons, with 4310 tons afloat for the United States. The total visible supply decreased 2535 tons, being 15,596 tons on April 30, as compared with 18,131 tons at the beginning of the month.

Copper.—The market was very weak during the greater part of the week, but a somewhat firmer tone was developed at the close. Business throughout the week was light and prices showed a gradual decline. The exports for April amounted to 16,275 tons, making a total of 65,765 tons for the first four months of the year, as against 28,587 tons for the corresponding period of last year. Lake Ingot, in small lots, is quoted at about 13c. to 13½c. per lb., and Casting Copper at 12¾c. to 13c.

Sheet Copper.—The demand for Sheet Copper is reported to continue in good volume. While consumers are buying mainly for present requirements, the volume of orders is large and sufficient to absorb the current output of the mills. Prices are firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—This market is without change and devoid of any interesting feature. The demand is quiet and prices are steadily held, American Pig in small lots being quoted at 4.45c. to 4½c. per lb. St. Louis advices are to the effect that a firmer undertone rules in the Lead market at that center, but trading is on a light scale.

Spelter.—Prices are firm, but consumers are still buying in small quantities. Jobbers' prices are a shade higher, small lots of Western Spelter being quoted at 4.65c. to 4.75c. per lb. St. Louis advices report little change in the Spelter market at that point. Transactions continue on a light scale and prices rule at the level of a week ago.

Sheet Zinc.—A fair demand for Sheet Zinc is reported, with prices unchanged at 6¾c. per lb. for 600-lb. cask lots and 7c. to 7¼c. for smaller quantities.

Antimony.—The market for this metal is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb., United States at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—The situation is unchanged. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues good and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—The Tin Plate market is entirely unchanged and remains quiet and uninteresting. We hear of no new business of any amount, but deliveries from mills are going on in large volume on contracts placed sometime back. Retail business is merely fair, but is expected to recover its activity by reason of the improvement in weather conditions. Prices are firm and without change. American Bessemer Coke Plates, IC, 14 x 20, are quoted at about $4.85 to $4.95 per box for moderate sized lots, delivered at New York or corresponding points. An advance of 1½ pence, to 13 shillings 7½ pence, on the price of Welsh plates was reported this week.

Sheets.—The Sheet market continues in a very satisfactory condition, the demand being heavy for both Black and Galvanized Sheets and prices ruling very firm. The mills are fully employed and a good deal of pressure for delivery is noted. Stocks both at mills and in store are at a low point and practically everything that is made passes into consumers' hands without delay. The demand is heaviest for Galvanized Sheets and Black Sheets of the heavier gauges. Jobbers' prices remain firm, No. 27 One Pass Cold Rolled Soft Steel Sheets being quoted at about 3.85c. to 3.90c. No. 24 Galvanized Sheets are quoted at 4c. to 4.20c. for small quantities, equal to 70 to 70 and 2½ per cent. off the list. The practice of quoting net prices for Galvanized Sheets has not become universal among the Eastern jobbers, but they are gradually working toward that point.

Chicago advices are as follows: The demand for Sheets has continued active and even urgent, but as a rule only small sales have been made because of the inability of mills to accept large orders for delivery within several months. Small lots of No. 27 Black Sheets from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store ruling at 4.70c. to 4.75c. for No. 27.

Old Metals.—The market is rather quiet. Supplies are increasing and the demand is not so urgent, with the result that prices have eased somewhat. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	9¾c.
Light and Tinned Copper	per lb.	8¾c.

Heavy Brass	per lb. 8 c.
Light Brass	per lb. 6¼c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2⅞c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 16 c.
No. 2 Pewter	per lb. 8½c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	8.50 to 9.00
Burnt Iron, per gross ton	7.00 to 7.25

THE PIG IRON MARKET.

New York.—Current business is confined almost entirely to small lots for prompt delivery, to meet urgent necessities. For these fancy prices are being asked and paid. We quote, for summer delivery, Northern Iron, at tidewater, No. 1 X, nominal, $21.50 to $22; No. 2X, $19.50 to $20; No. 2 Plain, $19 to $19.50; Tennessee and Alabama brands are as follows: No. 1 Foundry, $19.50 to $20.50; No. 2 Foundry, $18.75 to $19.25; No. 3 Foundry, $17.75 to $18.25.

Chicago.—The volume of business in Pig Iron has been relatively small, while there has continued to be an active, if not an urgent, demand for carloads for immediate or nearby deliveries. Sellers of local Foundry Iron have demanded and obtained a further advance of 50c. per ton, while Lake Superior Charcoal has been sold at $1 a ton above previous current prices. Southern Coke Iron continues strong, the advance of a week ago having been fully maintained. We quote as follows:

Lake Superior Charcoal	$22.50 to $23.25
Local Coke Foundry, No. 1	20.00 to 20.50
Local Coke Foundry, No. 2	19.50 to 20.00
Local Coke Foundry, No. 3	19.00 to 19.50
Local Scotch, No. 1	19.50 to 20.00
Ohio Strong Softeners, No. 1	22.10 to 22.35
Southern Silvery, according to Silicon	19.90 to 20.40
Southern Coke, No. 1	19.40 to 19.90
Southern Coke, No. 2	18.65 to 19.15
Southern Coke, No. 3	18.15 to 18.65
Southern Coke, No. 1 Soft	19.40 to 19.90
Southern Coke, No. 2 Soft	18.65 to 19.15

Philadelphia.—Business is not on a large scale, for the reason that the great bulk of requirements are already provided for, and moreover there is little or nothing for sale. The difference in prices between 60 and 90 days' deliveries and three to six months' deliveries is gradually fading out of sight and present appearances give little hope for lower prices for some months to come. Prices are practically the same as last week. The market is irregular and uncertain, each transaction being based on the circumstance at the time of delivery, character of Iron, &c. But on the average, business prices are virtually unchanged, as follows, for Philadelphia and nearby points:

No. 1 X Foundry	$20.50 to $21.50
No. 2 X Foundry	19.75 to 20.50
No. 2 Plain	19.25 to 19.75

Pittsburgh.—There is very little Pig Iron to be had and sellers who have any to spare can get almost any prices they ask. No. 2 Foundry Iron is selling at $20.50 to $21, Pittsburgh. Up to $20 a ton is being offered for Bessemer Iron for shipment over the last six months of this year and it is intimated that even $21 may be done.

Cincinnati.—The market is not active, simply because there is practically no standard Iron offering. There still seems to be a shortage on almost all grades for delivery during the next 60 days. What is in reserve for delivery for July 1 is not known. Some little Southern Iron has been sold as high as $16, Birmingham, for No. 2, but the range of $15 to $15.50 about covers the actual price-list. We quote f.o.b. Cincinnati as follows:

Southern Coke, No. 1	$18.25 to $18.75
Southern Coke, No. 2	17.75 to 18.25
Southern Coke, No. 3	17.25 to 17.75
Southern Coke, No. 4	16.75 to 17.25
Southern Coke, No. 1 Soft	18.25 to 18.75
Southern Coke, No. 2 Soft	17.75 to 18.25
Southern Coke, Gray Forge	16.75 to 17.25
Southern Coke, Mottled	16.75 to 17.25
Ohio Silvery, No. 1	20.85 to 21.35
Ohio Silvery, No. 2	20.35 to 20.85
Lake Superior Coke, No. 1	21.35 to 22.35
Lake Superior Coke, No. 2	20.35 to 21.35
Lake Superior Coke, No. 3	19.35 to 20.35

St. Louis.—A continuance of the quiet condition in the Pig Iron market at this point was manifest for the past week, while the interests here are in no position at the present moment to supply any considerable demand, there seems to be no serious nervousness on the part of the larger buyers, which gives the impression that their needs are well covered for some months to come. High prices rule for all the Iron available for immediate delivery, but as the demand and inquiry are on a very low scale the market is apt to undergo no severe test for a few weeks.

Southern, No. 1 Fouudry	$19.25 to $19.50
Southern, No. 2 Foundry	18.50 to 18.75
Southern, No. 3 Foundry	18.00 to 18.25
Southern, No. 4 Foundry	17.50 to 17.75
No. 1 Soft	19.00 to 19.25
No. 2 Soft	18.50 to 18.75

CHICAGO REPORT.

Scrap Iron and Steel.—There are freer offerings, but with a fair demand the market continues firm and prices are unchanged, with the exception of Cast Borings, which are a little firmer and 50c. per ton higher. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipe and Boiler Tubes	12.00 to 12.50
Cast Borings	7.50 to 8.50
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—The tone of the market for Copper Wire is easier, in sympathy with Ingot Copper, but there is a fair demand. Heavy Copper Wire is tending downward, but other Copper and Brass Material is well sustained. Tin Foil and Pewter No. 1 are a little firmer in tone and prices are fractionally higher.

	Per lb.
Copper Wire and Heavy	10½ to 10¾c.
Copper Bottoms	9¾c.
Copper Clips	10½c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	21 c.
Pewter, No. 1	17½c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—There is but little trading, but the offerings are not pressing and the market, in general, remains steady, while Rubber Shoes have been slightly advanced. Outside Tubing is fractionally lower. The market continues easy with free offerings and a moderate demand, but prices are sustained as previously quoted.

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	6.85c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Offerings are liberal and the market is easier without any change in prices. Good Country Mixed Rags, Chicago delivery, 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.--There continued to be a good demand up to the first of the month, because of the advance, which took effect May 1. The discount was advanced from 50c. to 40c. on the following schedule for all coal to be shipped in May:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

The Joseph Dixon Crucible Company of Jersey City, N. J., held their annual stockholders' meeting on April 21, when the following directors were elected: Edward F. C. Young, John A. Walker, William Murray, Joseph S. Bedle, Edward L. Young, George T. Smith and George E. Long. Officers were then elected as follows: President, Edward F. C. Young; vice-president and treasurer, John A. Walker, and secretary, George E. Long. The annual report showed larger sales in 1901 than in any previous year, as well as larger net earnings.

THE HARDWARE TRADE.

This is with the merchants throughout the country a very busy season, and the reports which come from the larger and the smaller houses indicate a very satisfactory condition of business. Stocks generally are well assorted except in the lines in which difficulty in getting goods is experienced. The policy of the trade is evidently to keep assortments up to a good working level. Jobbers and manufacturers accordingly find many orders coming in to them, not a few of which are coupled with the request that immediate shipment be made. Manufacturers for the most part have difficulty in getting out goods as fast as they are desired. This is particularly on account of delay in getting the material. The insufficiency of transportation facilities on the railroads also has some influence. With the great activity which prevails in nearly all factories, labor is not only fully employed, but scarce, and wages are gradually creeping up. The new business coming in from the larger trade is in fair, but not especially heavy, volume. Prices generally are very firm. Several advances are to be noted. Rumors of consolidation of some manufacturing interests are current, but nothing definite is reported in this direction.

NOTES ON PRICES.

Galvanized Range Boilers.—Manufacturers of Galvanized Kitchen Range Boilers have withdrawn prices under date of May 1. It is understood that an advance of 10 per cent. will be announced which will take effect from that date. For some time past reports have been current in the Boiler trade that the stocks of Boilers on hand at the manufacturers' plants were very low. Deliveries of Sheets from mills have been very unsatisfactory, and it was said that if a continued scarcity of Sheets was not broken by prompt shipments an advance in the price would certainly be announced. The withdrawal of prices, as noted above, indicates that this advance is about to take place.

Cast and Malleable Iron Steam Fittings.—The manufacturers of Cast Iron Steam Fittings withdrew all quotations under date of April 29. It is said that the recent advance in the prices of Pig Iron of the higher grades has been responsible for the change in the price of Iron Steam Goods. The prices on Malleable Iron Piece Fittings have also been withdrawn. Up to the present time the manufacturers of this line have not come to any agreement regarding prices, but it is understood in the jobbing trade that prices will advance not less than 10 per cent.

Plumbers' Copper Work.—The manufacturers of Plumbers' Copper Work, such as Copper Boilers, Copper Pantry Sinks and goods of a kindred nature, withdrew all prices under date of April 26. It is claimed that an advance in the prices of Copper Sheets is imminent, and that the manufacturers of Boilers and Sinks are very hard up for raw material, owing to the fact that the demand for this class of goods is much beyond the capacity of the rolling mills. It is understood that new prices showing an advance of a radical nature will be announced within the next few days.

Roofing Slate.—Under date of April 25, John Galt & Sons, 253 Broadway, New York, issue a new price-list of Roofing Slates which cancels all previous lists. The present list, which rules throughout the trade, shows increases of about 25 cents a square in a number of different grades of Pennsylvania, Maine and Vermont Slates. There has been, as yet, no advance in Bangor Slates, the manufacturers in that district having agreed when they issued the last price-list on January 1 to continue it unchanged until June 30, but there will undoubtedly be a sharp increase in the price on July 1. Meanwhile no orders are being accepted for this grade of Slate, except such as can be filled before June 30. In another column we give a review of the Roofing Slate market, which shows the strong position of this material at the present time.

Sad Irons.—The manufacturers of Sad Irons have made another advance of ⅛ cent per pound in the price of these goods, being the second within a month.

Wire Nails.—Conditions in the Wire Nail market have undergone no change. The outlook for local business in New York is satisfactory with a fair demand. Deferred shipments from mills make it difficult for jobbers in some instances to keep their stocks well assorted. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—The demand for Cut Nails is large from the territory tributary to New York. Owing to the difficulty of keeping stocks well assorted the tone of the market is firm. Small lots of Cut Nails from store are quoted at $2.30 per keg, placing Wire and Cut Nails on precisely the same level.

Window Glass.—The National Window Glass Jobbers' Association have advanced the price from store to 89 per cent. discount for all sizes of both double and single strength Glass. Meanwhile there is very little business doing.

White Lead.—The favorable weather has given an opportunity to begin work which has been previously delayed, resulting in a free delivery on contract orders. Indications point to a continued active demand for White Lead in Oil. Prices are quoted at 6½ to 6¾ cents per pound for retail quantities.

Linseed Oil.—There is comparatively little new business doing in Linseed Oil. The large buyers have anticipated an advance in price for the last two or three months and most of them have contracted for enough Oil to carry them until June, if not longer. The further advance in price which seemed probable last week is not likely to take place if the present lack of demand continues. Orders are confined to small lots, retail quotations being 67 to 67½ cents per gallon.

Spirits Turpentine.—The buying at this point is confined to small lots of Turpentine and deliveries are being made to consumers on contract orders. Reports are to the effect that there is a decrease of offerings at the South and a firmer market. Small lots of Turpentine are quoted at 46 to 46½ cents per gallon.

Old Rubber.—The market for Scrap Rubber is not especially active or firm. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb....................	5 c.
Rubber Shoes, less than carloads, per lb..........	6½c.
White Wringer Rolls, per lb......................	7 c.
Inside Bicycle Tubing, per lb....................	21½c.
Outside Tubing, per lb..........................	6 c.

TRADE NOTES.

The Knecht Brothers Company, Cincinnati, Ohio, have issued a small pamphlet in the interests of the Knecht Friction Sensitive Drill Press, which can be adjusted to variable speeds, without cone pulleys or shifting of belts. An adjustable tension device under the lower cone prevents slipping and every device can be operated from the front part of the machine, so that the operator need not change his position. The machine has a capacity of 9-16 inch and smaller.

It is reported that Shanks & Co. of Memphis, Tenn., have purchased a site at Livingston, Ky., and will erect a Pump factory at that place.

The Southern Brass Company of Lexington, N. C., have been organized with a capital stock of $10,000 for conducting a general Silver, Nickel and Brass Plating business. J. L. Peacock is president; W. K. Finger, vice-president and general manager, and Jas. H. Alexander, secretary and treasurer.

The St. Louis Brass Mfg. Company, St. Louis, Mo., with capital stock of $50,000 have been incorporated by Gustave Plens, Alfred C. Enstein, Edwin F. Guth and others.

The offices and showroom of the Lalance & Grosjean Mfg. Company, at 19 and 21 Cliff street, New York, are being entirely remodeled. Handsome metal ceilings and side walls have been put in place and the offices are to be completely refurnished and decorated.

When completed they will be among the most attractive quarters in the downtown district.

The New England Enameling Company, Middletown, Conn., have filed articles of incorporation, with a capital of $50,000, for the purpose of manufacturing and selling Enameled and all kinds of Steel Ware. The factory is to be located at South Farms. The incorporators are Jacob H. Newmann and Max Mailhouse of New Haven and Charles H. Brown and James H. Barry of Portland, Conn.

Kettering & Sanderson, 516 Sixteenth street, Chicago, announce that they have purchased the Stove, Hardware and House Furnishing business of Frank C. Goff & Co., and will also install hot air furnace work and special refrigeration plants.

The Cox-Edmand Hardware Company, Colorado Springs, Colo., have been incorporated with a capital stock of $25,000. The incorporators are John M. Cox, John A. Edmand and Clarence E. Cox.

J. E. Forsee & Son, 409 North Main street, St. Louis, Mo., are mounting Repair Knobs on Cards, with a picture of an Indian's Head in the center. The cards are 12 x 14 inches in size, with an easel back, so they can be used for display purposes. There are 49 knobs on each card, several different sizes being shown, and the cards are packed separately, each one in a box.

That the conventional Register, which has not changed in detail for years, has a rival for popularity is reflected in the growing demand for the Auer Side Wall Register, shown and fully described in our advertising columns, and made by the Auer Register Company, Toledo, Ohio. A feature that has attracted the attention of practical men in the heating business is that the Register presents but little obstruction to the flow of air and allows the full capacity of the flue. If used in a flue that also heats an upper room it will regulate the amount of air for each floor to a nicety. It has been found to increase the power of partition flues. The manufacturers are finding a growing interest in this Register among the furnace trade.

Welsh Tin Plate makers are making renewed efforts at the present time to push their product abroad and to discover new uses to which Tin Plates may be applied. W. Bright of the Wowerton Tin Plate Works and D. Richards of the Pantyffyon Tin Plate Works of South Wales are said to be making efforts to introduce into use a box made of Tin Plate as a substitute for the wooden box now used to supply aerated waters in Great Britain. Strength is given to the box by means of corrugations. Efforts are also being made to introduce Tin Plate linings into tea boxes in India, Ceylon and China, in place of the Lead lining that has always been used heretofore. Late advices from the other side indicate that a large market for Tin Plates has opened up in South Africa, where a great deal of construction work is already begun and is contemplated, which will call later for a large amount of Tin Roofing.

The Kentucky Iron Roofing & Corrugating Company have completed their new plant at Twelfth and Prospect avenues, Covington, Ky. The building is of iron frame construction covered with iron siding and corrugated roofing. It occupies an area of 50 x 250 feet. The building below the first floor will be used for storage and warehouse purposes. The machinery is of the very latest type, and each machine is driven by an individual electric motor. The present capacity of the plant is from 500 to 600 squares a day of strictly Iron Roofing. No steel material whatever will be used by the company, who are seeking to cater for a constantly growing demand for Iron instead of Steel Roofing. They claim that many users of sheet metal are going back to the original material. When the sheets are used for roofing purposes it is found that a good quality of Iron is far superior to the Steel Sheets now generally furnished for this purpose. The company at present are employing 25 men.

The annual convention of the American Foundrymen's Association will be held in Boston on Tuesday, Wednesday and Thursday, June 17-19. The Hotel Brunswick has been selected for the headquarters of the association, and the meetings will be held in the large assembly hall of the Massachusetts Institute of Technology. Secretary Richard Moldenke announces that from reports thus far received the attendance promises to be larger than at any previous meeting of the association. The Boston foundrymen are preparing to hospitably entertain the delegates to the convention.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman Streets, Pittsburg, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburg district, with all machinery, for making corrugated conductor pipe, eaves trough, ridge roll, etc. This is an opportunity to secure a bargain for one desiring a business, that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, etc., or any practical party, with capital caring to take an interest in the business, please address

H. L. IRWIN, Receiver for
Marlin & Co., Inc.,
Pittsburg, Pa.

FOR SALE.

Cornice, Tin and Sheet Metal job shop in one of the best towns in Iowa. 15,000 population. Good shop and a well established business. Plenty of work and a money maker. A snap for a cornice maker and tinner who wants to get into a good paying business. About $700 cash required.

Address BOX 49,

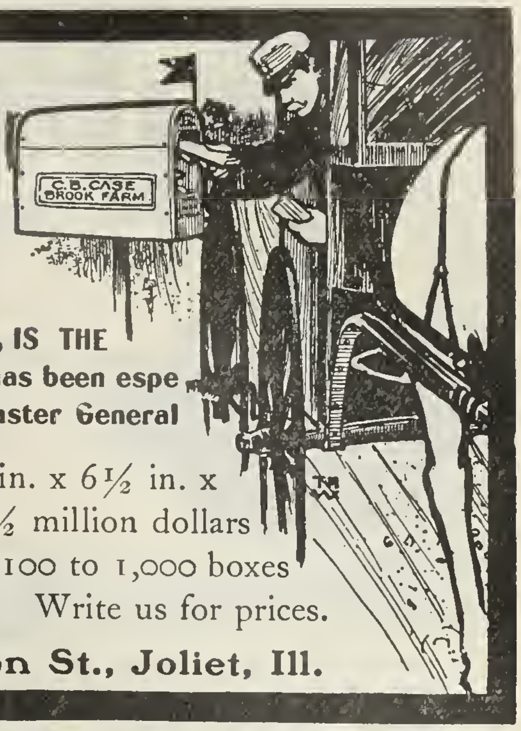
RURAL FREE DELIVERY

THE ...SIGNAL MAIL BOX
BATES-HAWLEY PATENT.

A POSTOFFICE AT YOUR DOOR

THE SIGNAL MAIL BOX, Bates-Hawley Patent, IS THE ORIGINAL BOX FOR RURAL SERVICE. It has been especially recommended by the Postmaster General



It is the largest, and the only box full government size, 18 in. x 6½ in. x 11½ in., and the only one which meets all the requirements. 7½ million dollars just appropriated for extension of rural service this year. From 100 to 1,000 boxes will probably be put in in your vicinity. You should sell them. Write us for prices.

SIGNAL MAIL BOX CO., 101 Benton St., Joliet, Ill.

"BOSS" WASHING MACHINES.
Trade-Mark.

Closed View.

Illustration of the latest improved "BOSS" double action and rub board washing machine. Has all gearing enclosed and other important improvements.

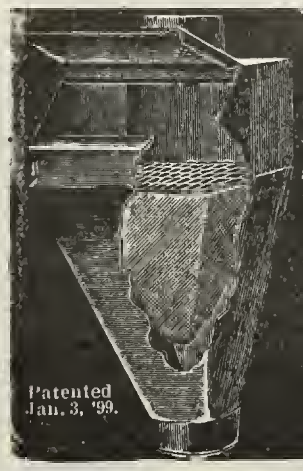
SIZES: { 7, 8, 9, wood frame lower cylinder.
10, 11, 12, steel frame lower cylinder.

We are also the patentees and manufacturers of the following:

The Boss Internal Gear Washer,
" " External " "
" New Boss Rotary "
" " Champion Rotary "
" " Standard Champion "
" Standard Perfection "
" Banner Washer and
" Improved Standard.

The washers are carried in stock in carload lots in all the principal cities. Write us and we will quote you prices and at same time advise you as to where and from whom you can obtain them from stock, thereby, perhaps, saving extra cost of freight, than when shipping from factory. These washers are carried in stock under jobbers' special brands, but none are genuine without our name and address appearing on each machine. Write for one of our beautifully illustrated and descriptive catalogues, mailed free upon application.

BOSS WASHING MACHINE CO., P. O. Station H, **Cincinnati, O.**



Patented Jan. 3, '99.

217 Water St., near Beekman St., New York.

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free. Address

Gummey, McFarland & Co., - - Philadelphia.

ALUMINUM COATED SHEET STEEL.

The only "Non-rustable" Coated Sheet.

Coating will not flake off when heated to a red heat.

Can be soldered with common solder.

STEEL & IRON ALUMINUM COATING CO.,
Connellsville, Pa.

TIME was when we used to keep nothing but Galvanized and Black Iron and Tin Plate, but now we keep everything that a tinner or stoveman wants or ever will want. The reason is—we couldn't help ourselves. We don't mean to brag, but our customers found us so accommodating, and that by dealing with us they saved so much money, that they ask us now to furnish everything they want. We will do the same for any tinner, stoveman or cornice maker in the country. Drop us a line. MEURER BROS. CO., Brooklyn, N. Y.

This—MF—is the trademark stamped on every sheet of M F Roofing Tin—the best roofing tin made—fifty years the world's standard for roofing tin. This mark is evidence that the tin bearing it has the heaviest and richest coating of pure tin and new lead, dipped by the palm-oil process, and manufactured entirely by hand *labor, M F is impervious to rust—it is the roofing that will last a lifetime, and costs but little more than a roof that burns—or melts—or freezes—or breaks. If you are going to rebuild, specify M F ROOFING*

SHOWING DOVETAIL KEYS

THE CEILING QUESTION SOLVED!

IN the past the objection was raised that Metal Ceilings were not artistic. That objection no longer holds good.—**BERGER'S CLASSIK METAL CEILINGS** have completely done away with it. You now can have Metal Ceilings that are thoroughly artistic and strictly in harmony—from top to bottom—all over—throughout—if you select and order **Berger's Classik.**

BERGER'S "BERGER'S Classik TRADE MARK METAL CEILINGS" CEILINGS

are made in eleven complete and distinct artistic styles—Greek; Roman and Romanesque; Gothic and Moorish; German, French and Italian Renaissance. Rococo; Empire and Colonial—each provided with a variety of patterns to meet the requirements of different rooms.

If you have not seen our Classik Designs, it is more than likely you do not realize how effective they are. Write for Catalogue No 5 and judge for yourself of their beauty. Give us a chance to figure on your requirements.

Art and Beauty are combined in our METAL CEILINGS

We make The Latest Designs with the Best Fitting Joints. They are therefore easily applied: and our prices are right.

A TRIAL WILL CONVINCE YOU.

We also Make CORNICE SKYLIGHTS, VENTILATORS ETC.

J. H. Eller & Co. Canton, Ohio.

Cornice Ceilings Roofing

Registers Conductor

When accepting the agency for a line of Ceilings, remember that time means money to you, and if it takes twice as long as necessary to erect a cheap metal ceiling because of faulty construction, what matters a few cents difference in the original price?

You depend on making your profits by the time it takes to put the ceiling in place. Get "Canton" Metal Ceilings and you will have a winner.

They are artistic in design, and are easy to apply because all parts match perfectly, alignment is straight and regular and joints are tight fitting, requiring no putty to close cracks, which will mean a saving to you of 50% in labor.

Let us demonstrate what we say. Give us a trial order and others will follow.

Complete assortment of classified designs.

If interested, our mammoth catalog is yours for a postal.

LITTLEFORD BROTHERS,
453-55-57 Pearl Street. - CINCINNATI O.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER
THE DOUBLE TRUSS CORNICE BRAKE CO.

New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

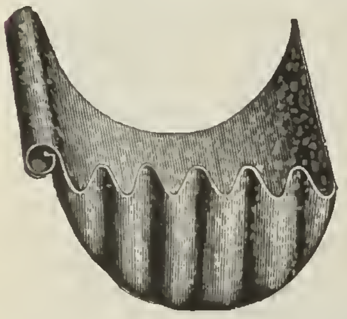
This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the head and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.



I close your eave trough and make them frost proof, and look neat.

CORNICE MAKERS' SQUARING SHEARS, With Lever Arc, Automatic Gauge. Will cut No. 2 iron. 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times without sharpening. We have cut off such a bar 387 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of $1.00.
All good blades are stamped with a ★

ROUND OAK
Standard of America

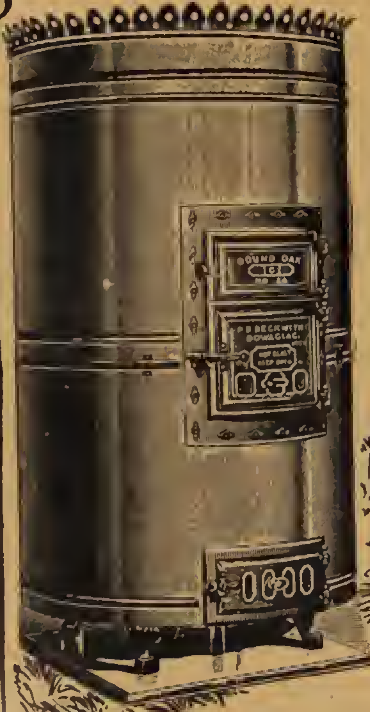
We make a

Round Oak
Room Heater

It heats by circulation.

It equalizes the heat in all parts of the room just like a furnace.

It is the most effective stove for heating school-rooms, halls, stores and other rooms ever devised.



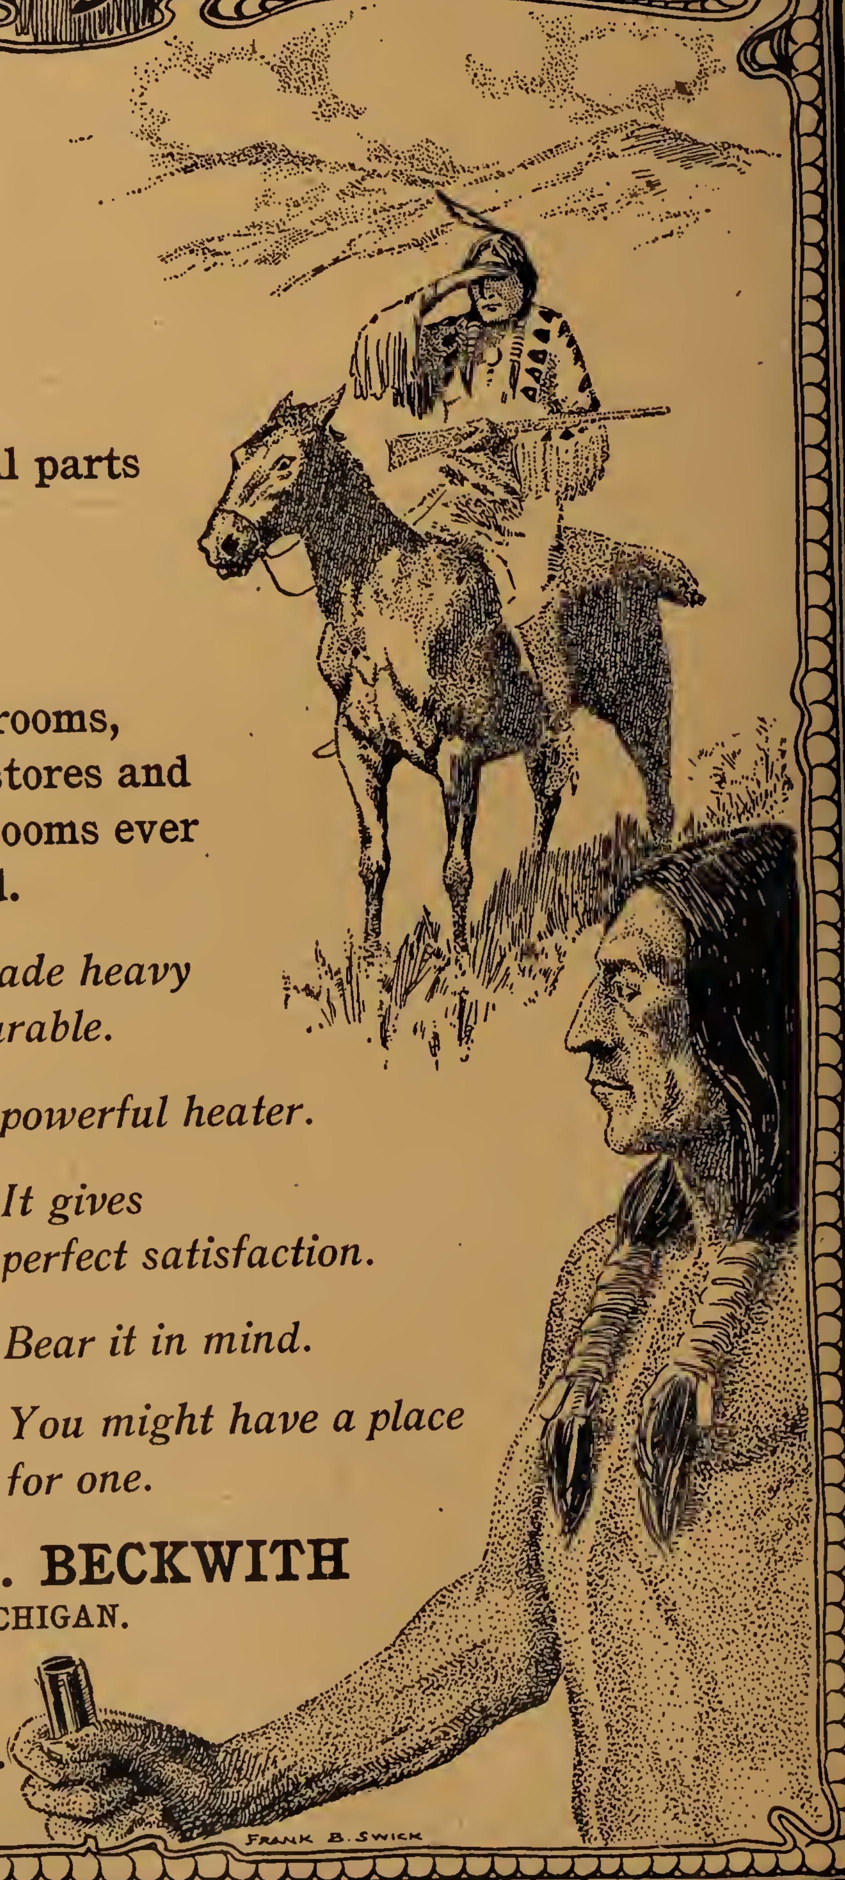
It is made heavy and durable.

It is a powerful heater.

It gives perfect satisfaction.

Bear it in mind.

You might have a place for one.



ESTATE OF P. D. BECKWITH

Makers of
Good Goods only.

19

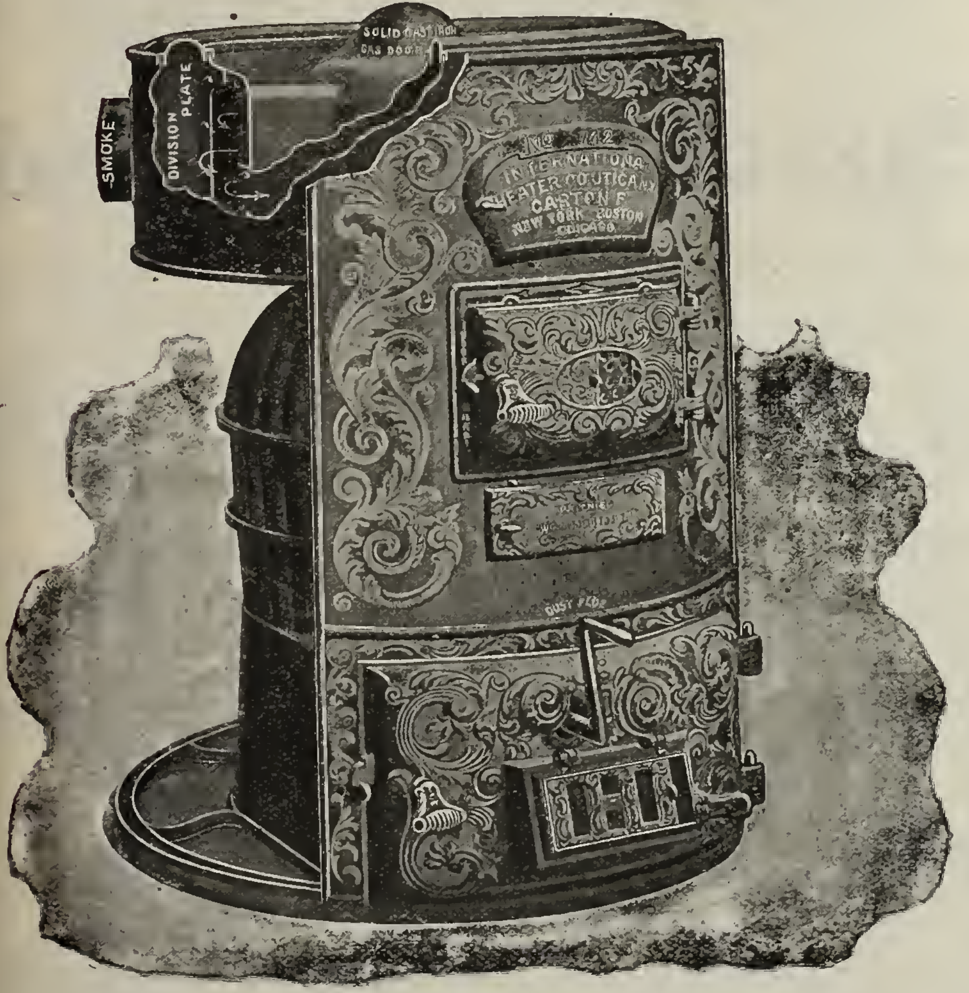
Rogers & Wells - Chi-

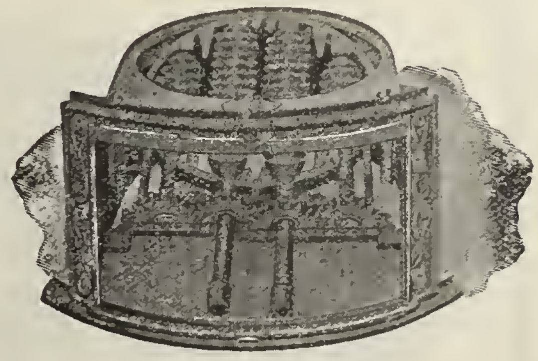
FRANK B. SWICK

It is far easier to effect a single sale than to gain a permanent customer. Glue them to you—make them stick—sell good goods—CARTON FURNACES, for instance.

CARTON "F"

WARM AIR FURNACE





There are many "talking points" about this heater.

One thing may be emphasized strongly:

No furnace in the market presents more efficient fire surface.

Look at the gas dome—a one-piece casting—no chance for an argument here.

MODERATE IN PRICE.
THOROUGHLY EFFICIENT.

CATALOGUE OF OUR ACETYLENE GAS MACHINE WILL INTEREST YOU.

Moore's QUICK OVEN Stoves

M TRADE MARK

HUSTLES HIM TO WASH HIS FACE

Mr. B. J. Norby of Cassville, Mo., writes as follows:

> "One of the Steel Stoves recently ordered was for Editor Charles Ray. He is very much pleased with it. Mrs. Ray thinks that there is no other worth having. She says it bakes so quickly that her husband hardly has time to wash his face before breakfast is ready."

The kind of satisfaction shown in this letter is the kind that counts big for future business. It reaches the neighbors and friends, and in the end makes many sales.

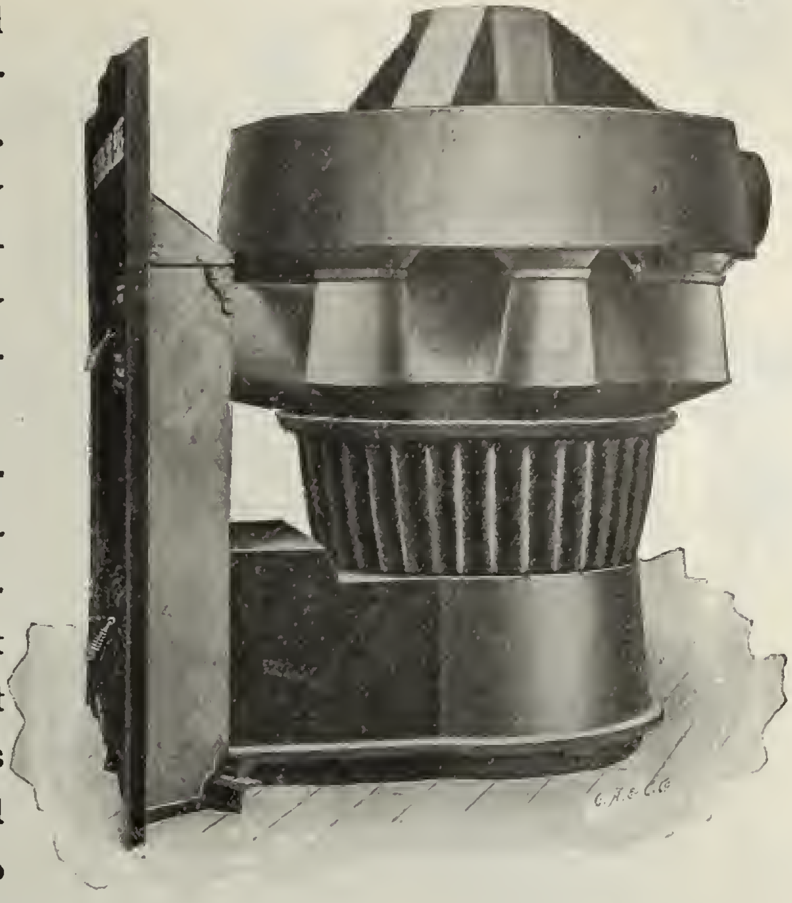
MOORE'S QUICK OVEN STEEL STOVES give this kind of satisfaction in abundance. That's what makes them

"The Easy Line to Sell."

Joliet Stove Works, Joliet, Illinois

HOLBROOK, MERRILL & STETSON, San Francisco, Sacramento, Los Angeles.

BOYNTON SCHOOL HEATER



The Boynton School Heater is manufactured for and sold to the TRADE only.

It is more extensively used by dealers and heating contractors than any Warm Air School Heater made.

We not only stand behind the heater for its capacity to warm very large volumes of air, but we have at our command the best engineering talent in this line of work to be had; and this important requisite to success is at the service of our customers.

If there are school buildings to be erected or equipped with Heating and Ventilating plants in your vicinity, it will pay you to communicate with us AT ONCE. DON'T WAIT.

Of all School Heaters the Boynton is best adapted to the work: It is the largest, the heaviest, the most durable, has greatest radiating surface, is the only self-cleaning furnace, gas, smoke and dust tight, has the best grate, is no experiment, and we but repeat what the school people say of it.

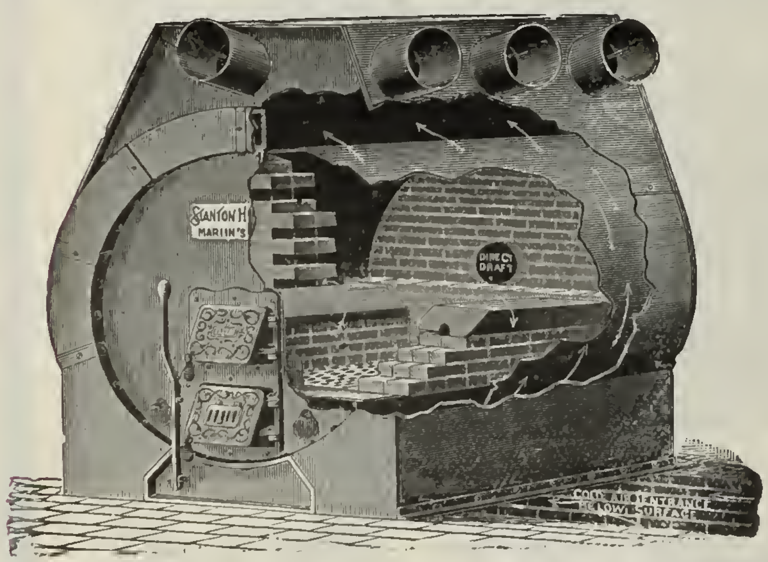
The Stanton Seamless Heater,

PORTABLE CASED.



Louisville, Ky., April 5, 1901.

The Stanton Heater Co.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the Fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly,
ROBINSON-HUGHES & CO.

The Best Test

Of a furnace, with reference to its heating power, is the amount of space it will heat with a given amount of fuel under a proper state of combustion. We make the distinct claim for our

Magee Cottage Furnace

of superiority in this respect over any and all furnaces where a high grade furnace at a low price is desired. It is not offered in competition with inferior grades, designed especially for the cheapest class of work, but is a construction from which the greatest amount of heat can be obtained from the least amount of fuel, and at the same time add to your reputation.

Send for Catalogue.

They are up-to-date in every respect and have many special features not found in other furnaces.

WRITE FOR CATALOG.

ROBINSON FURNACE CO., Chicago.

About three weeks ago a dealer sold a No. 8-20 "HOME WINTHROP" Range to be used in a bake-shop and also do the cooking for a small restaurant.

It was to replace an ordinary 8 inch range of another make that had not been entirely satisfactory, either as to quantity or quality of work done.

The old range required from 6 to 7 hods of coal every 24 hours

The "HOME WINTHROP" does more and better work with a little less than 3 hods in 24 hours.

We only claim that the "HOME WINTHROP" bakes with **ONE-THIRD** less fuel—this man says **ONE-HALF.**

DIGHTON FURNACE CO., Taunton, Mass.

SUPERIOR FURNACES

UTICA HEATERS

BUY
THE
BEST

EASILY OPERATED.

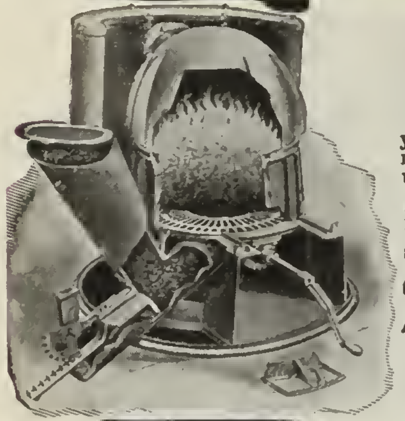
SUPERIOR Furnaces and UTICA Heaters require less care and attention than any other furnace on the market. There is no complicated system of drafts and dampers—merely pulling one chain in the living room will open the drafts, pulling the other chain checks the furnace. "A Child Can Do It!"

SUPERIOR Furnaces and UTICA Heaters respond quickly and effectively to change of dampers. They're built that way.

Ask for catalogue and discounts. They're interesting.

UTICA HEATER COMPANY,

Manufacturers, *UTICA, N. Y.*



IF YOU ARE NOT SELLING THE

Peck=Williamson Underfeed Furnace

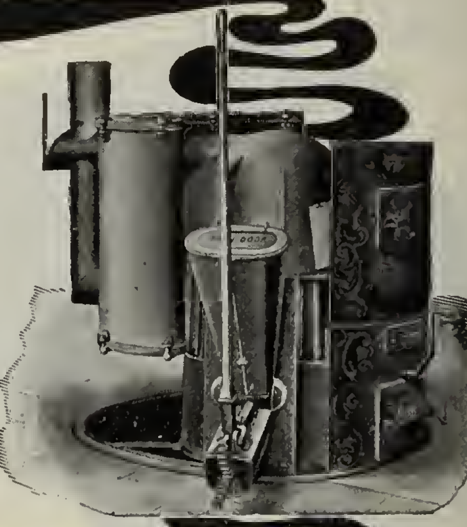
you have not the trade and are not making the money you might Just a pull or two of the lever feeds the new coal from underneath.

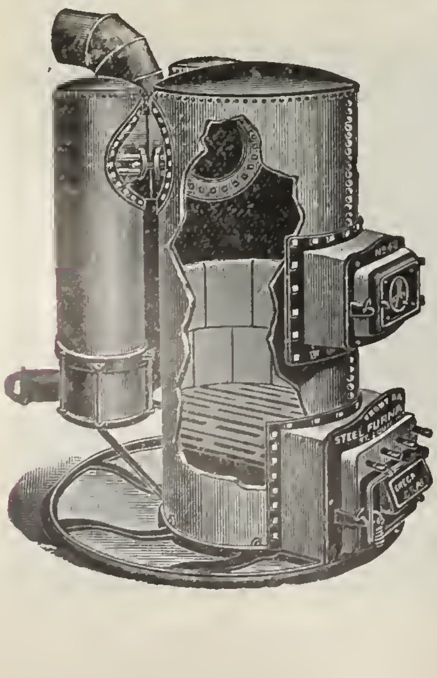
The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.



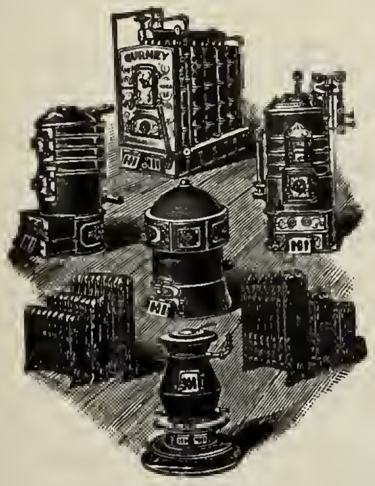


A FEW POINTS OF SUPERIORITY

Fire pots are of fire clay tiling and never burn out.
Radiator surface in proportion to grate surface unusually large.
Only absolutely gas tight furnace made.
Novelty of construction makes an easy seller.
Tested for fifteen years.

Repairs are seldom necessary.
Are guaranteed to burn hard or soft coal.
No direct draft to warp out of shape, nor packed joints to leak gas.
Katalogue and prices will be mailed you upon application.

FRONT RANK STEEL FURNACE CO., 2301 to 2309 Lucas Ave., St. Louis, Mo.



The Financial Argument.

Some of the heaters on the market are not worth their price because better value can be secured for the same money. That's the great argument in behalf of

"GURNEY" HEATERS,

BRIGHT IDEA DORIC and 400 SERIES.

They furnish decidedly greater value yet they cost no more than ordinary heaters. Not only do we say so but a host of testimonials from present users corroborate this statement.

That one fact alone ought to be sufficient to induce every dealer who wants the fullest measure of business to handle "Gurney's." If you are in that class we shall expect to hear from you relative to an agency. Latest trade catalogue for the asking.

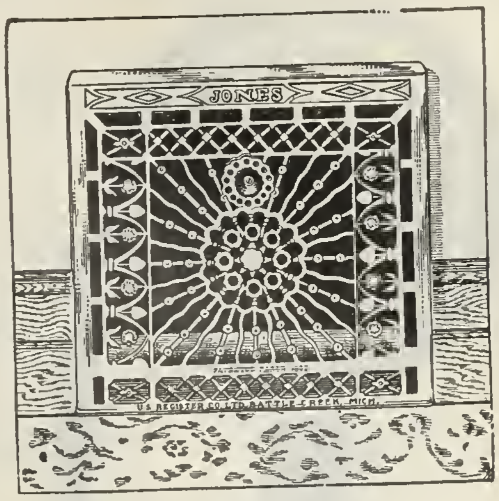
The Reason Why

The JONES Side Wall Register

IS THE BEST—



JONES
PATENTED
U.S. REGISTER CO. LTD. BATTLE CREEK, MICH.

Because—It has a double metal box with a ventilating air space between the inner and outer casing, therefore is absolutely FIREPROOF.

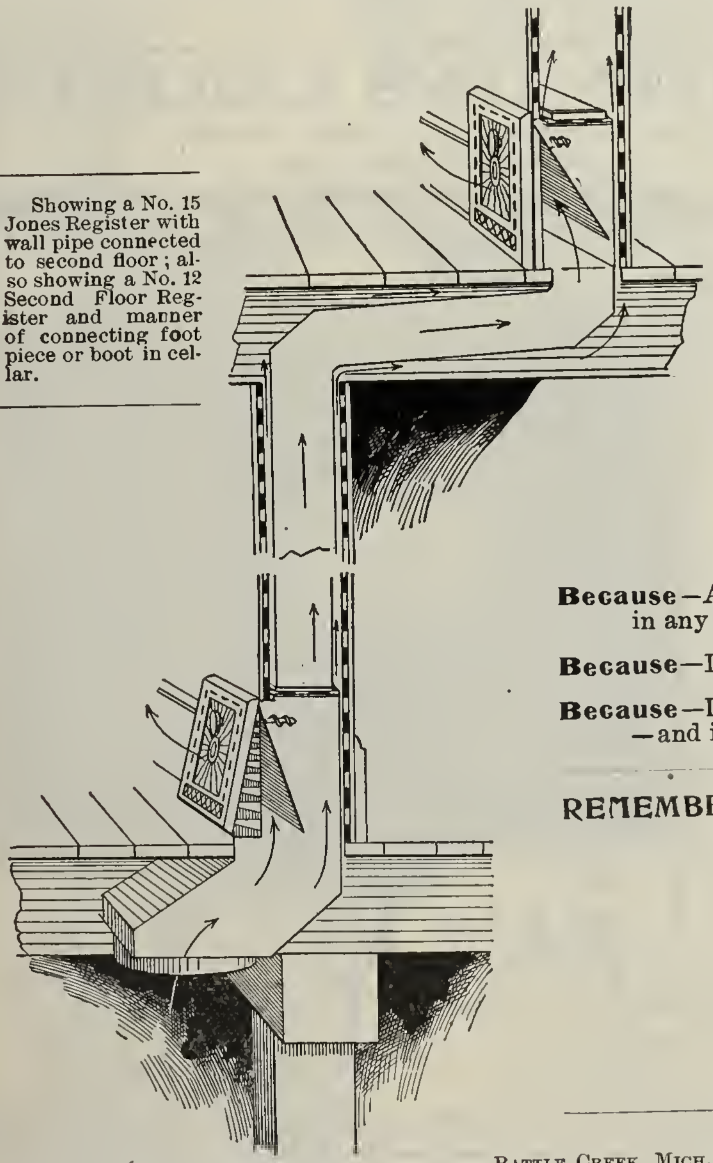
Because—It is NOISELESS; the deflector, which divides the flow of air, does not RATTLE when adjusted.

Because—It has 50% more capacity than any other similar register.

Because—Every room is supplied with a Deflector and Foot-warmer. See our double headers.

Because—The heat does not make the register two colors, as is the case where part of the front is used to divide the flow of hot air.

Because—Two rooms can be heated with one large basement pipe, in place of two smaller pipes—either two on the first floor, or one on the first and one on the second.



Showing a No. 15 Jones Register with wall pipe connected to second floor; also showing a No. 12 Second Floor Register and manner of connecting foot piece or boot in cellar.

Because—By reducing the number of basement pipes and enlarging them, there is less loss from friction and radiation in the cellar; cool cellars and warm rooms are the result.

Because—Less fuel is used by less loss of heat in the cellar.

Because—A furnace can be installed with half the number of pipes necessary where common registers are used; fewer elbows, angles, collars and dampers, and as a result—more head room in the basement.

Because—It obviates the necessity of cutting rich and expensive carpets.

Because—The finish is not worn off by walking over them, as is the case where floor registers are used.

Because—It is easily cleaned. During the Summer months it is not a receptacle for dust and sweepings.

Because—Aside from being thoroughly practical, it is an ornament in any room.

Because—It assists in selling and renting houses.

Because—It is made in eighteen (18) sizes, adapted to all sized rooms—and in all the different finishes to match other trimmings.

REMEMBER—It is NOISELESS.
It is FIREPROOF.
It is practical.
It has 50 per cent. more capacity than others.
The heat can be turned on the first or second floor as desired, without going to the basement.

Battle Creek, Mich., April 1st, 1902.

The United States Register Co., Ltd., Battle Creek, Mich.

Gentlemen:—Replying to your inquiry regarding letter published by another Register Co. will say, in the first place, I never wrote the letter referred to, although my clerk may have done so.

We did use a ——— Register until we saw the Jones Register, but adopted the Jones owing to their having more capacity, a double ventilator register box, and because they didn't rattle when opening and closing them. The arrangement for operating the deflector of the Jones Register does not get hot, and by not using a part of the front for a deflector does not become discolored, as was the case with the register I turned down for the Jones.

Yours very truly, L. MOBLO.

Practical Hints on Joint Wiping,

FOR BEGINNERS IN PLUMBING.

SIXTH EDITION, ENLARGED.

With forty-one illustrations; 66 pages. Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

The Anthracite Coal Dispute.

It will be a most unfortunate thing if the efforts to secure an amicable settlement of the differences in the anthracite coal mining industry prove unavailing and a strike occurs after all. Conferences which were held in New York early this week between representatives of the operators and the coal miners, under the auspices of the Arbitration Committee of the National Civic Federation, have apparently accomplished little or nothing. President Mitchell of the United Mine Workers, on his departure for Scranton, Pa., left the impression that the Executive Committee of the union were not likely to accept the terms offered them by the operators, while on the other hand the coal operators do not show any sign of willingness to offer concessions. In some well informed quarters an early strike of the coal miners is regarded as almost inevitable unless something entirely unforeseen should intervene. The question at issue appears to hinge mainly upon the degree of actual control of operations at the coal mines to be exercised by the unions and by the employers. Both sides having declared that they can go no further in the way of concessions, there is, apparanetly, but slight ground for mutual agreement. Nevertheless it is to be hoped that the matter may yet be submitted to adjustment by arbitration. Meantime it is gratifying to note that the negotiations have been carried on with an unusual degree of moderation and good temper on both sides, a fact which should tend to make an ultimate understanding the more practicable. It is said that a strike in the anthracite region of Pennsylvania would cause some 147,000 mine workers of all classes to be idle if they obeyed the order of the union, and collieries to the number of 357, with an annual output of about 55,000,000 tons, would be shut down. What the stoppage of so vast an industry would mean to those employed in and dependent upon it, as well as to the public at large, whose comfort rests so largely upon the product of that industry, can scarcely be estimated.

The Texas Oil Wells.

It was announced by some of the Eastern papers early in the week that the palmy days of the great Spindle Top gushers of the Beaumont oil fields in Texas had passed, these gushers, after more than a year of great activity, being said to have suddenly ceased gushing. The plausible explanation accompanied this report that the cessation of activity was caused by some great natural disturbance of the earth, which resulted in a relaxation of the pressure that caused the wells to spout, and as the alleged stoppage occurred immediately after the recent earthquake in Central America, that the earthquake was the cause of it. This report was closely followed by a denial of its accuracy. It is asserted that the oil wells on Spindle Top have not ceased gushing. The reports in the papers that the wells had stopped flowing were probably founded on the fact that the natural gas pressure of that region has greatly lessened, and the subsiding of some of the gas wells probably led to the report of the general lessening of pressure at both the gas and the oil spouters. Since the famous Lucas gusher was struck on Spindle Top, over a year ago, some five hundred other spouting wells have been started, all of which have been active gushers. So far no diminution in force or in the supply of oil is indicated. Should it occur, however, that the oil pressure should become reduced so that the wells will no longer gush—a development which is expected in the course of time—this need not be regarded as at all inimical to the prosperity of the Beaumont oil fields. Oil is known to exist in great abundance below the surface, and should spouting cease, the only change that will be required will be to pump the oil up by mechanical means, instead of relying upon the forces of nature. The Texas oil fields are likely to yield wealth for many years to come. The shipments of oil from Beaumont during the month of April aggregated no less than 5000 cars. This is the largest total for any month in the history of the industry. With the increased facilities for handling the oil, it is expected that the shipments from the fields will show further increase each month hereafter.

The Value of Licenses.

Ever since the authorities of many States and cities have provided that the plumber must demonstrate his competency before he can secure a license to engage in the plumbing business plumbers who have complied with the requirements of the law have been impressed with the idea that the same authorities should see that they are protected from competition with men who have no licenses, and who, in consequence, are violating the law. The correctness of this contention has not been questioned, but for their own protection it has been found necessary by the plumbers in many instances to themselves bring the violators of the law to justice. In a number of cities the plumbers support a man whose business it is to look after such violations and bring them to the attention of the magistrates and courts. The laws of many States are clear on this point, as well as the local regulations of cities prepared in accordance with the provisions of the laws. It is not, however, just that the plumbers should be expected to bear the burden of enforcing the laws, particularly as the violations are mostly on the part of men who shirk the examinations or have not the competency to pass them. In consequence much of their work, even though it be merely the repairing of old plumbing systems, is improperly done, and often so as to leave the plumbing in an unsafe sanitary condition. Such workmen are a menace to the general public, and the health boards, which have a large measure of influence in the preparation of the plumbing regulations, should give more attention not only to preventing the infringement of the sanitary laws, but also to the protection of the rights of those who have complied with the legal requirements.

Street Heating Systems.

A field of effort which is now attracting the attention of capital and engineers is the laying of mains in the streets for the heating of buildings. The authorities of many cities and good sized towns all over the country are being petitioned to grant permits to use the streets for laying these mains. The promoters of these enterprises expect to derive a return for their outlay by furnishing heat, by means of steam or water or other mediums, to customers on the streets along which their heating mains are run. In a majority of instances franchises of this character are sought by those who are building electric lighting plants, for the purpose of utilizing the exhaust steam after it has passed through the engines used for the generation of electricity. The petitions, however, are by no means confined to electric lighting companies. Many come from manufacturing plants which have heretofore allowed their exhaust steam to go to waste, but are now desirous of utilizing their exhaust steam through the street mains for heating. It is already noticed that where such methods of heating have come into use there has been a transfer of activity from the stove department of the smaller tradesmen to their steam and hot water heating department. Where heretofore the tinsmith has been engaged in making and fitting stove pipes, furnace jackets, furnace pipes and fittings, and other kindred sheet metal work, it is found that less work is being brought to his hand, while his fellow workman, the steam fitter, is more actively engaged in running pipes and setting radiators in the houses and buildings of customers. Meanwhile the salesman is none the less busily occupied in showing catlogues and samples of different styles of radiators, where heretofore samples of stoves and furnaces were explained to his customers. From the large number of lighting and heating companies that are being incorporated and are seeking franchises it would seem that, although the smaller tradesman will lose no business, he must be prepared to adapt himself to the demands that his customers are likely to make upon him, and to this end should give more attention to the designing and installation of steam and hot water heating systems.

Causes of Business Success.

In a recent report to his Government, Mr. Wyndham, the British Consul at Chicago, offers, for the benefit of his countrymen, some plain suggestions regarding American business methods as he has observed them in that great industrial and commercial center. They are evidently based upon a careful study of the conditions by a trained and intelligent observer and are worthy of note as embodying the results of an investigation by a qualified outsider of the reasons for the extraordinary commercial success of this country. This success the Consul attributes, in part, to "the education which teaches the boy independence and knowledge of his future responsibilities, and does not set the professions above business as a means of gaining a living." Another cause of success, he asserts, is the keeping of the money which has been made in the business and the brains which have made the business in it as long as possible, and the great thought which is devoted to arrangements whereby, after the death of the builder of the business, it shall not fall into the hands of his heirs, unless they are practically fitted to take care of it.

Another, and probably the chief, cause the Consul finds in the reward of merit. "The percentage of men fitted for the highest posts in business," he says, "is very small compared with the total numbers employed; and the heads of the big businesses, bank corporations and wholesale firms are always looking out for men, not only among those already in their employ, but also outside, capable of filling some post under them. To these men, when found, large salaries are given, which are drawn by them as long as they show that they are capable of earning them. Men employed in business houses of all descriptions are encouraged to discover new methods of carrying on the business which may in any way lessen the cost of production or carrying on of business, and specialization is carried on to an extreme point." He cites, in illustration, one case that has come under his notice, where the manager of a factory in six months doubled the output at an increase of 5 per cent. in the expense by rearranging the machinery. It is the pursuance of this policy, the adoption of the latest and best machinery and the familiarity of the workmen with its use, together with the excellent system of shop management, which combine to secure the conspicuous success of the American manufacturer.

Many visitors from the United Kingdom blame the English workmen because the same results are not obtained from similar machinery there as in the United States. "But," says Mr. Wyndham, "the more the factories are seen the more certain it becomes that it is the incentive to work and the energy of the managers, superintendents and foremen and the example set by them that has the wonderful effect on the output. This holds good in every kind of trade and business." These conclusions show the result of careful observation and certainly merit the attention of those for whose benefit they have been published.

U. S. Steel Corporation Statistics of Production.

At a meeting of the Board of Directors of the United States Steel Corporation this week, C. M. Schwab, the president, submitted statistics of the production of the constituent companies of the corporation for the first fiscal year, ended March 31, 1902. Among the products manufactured by the concern during the past year were: 6,961,534 tons of pig iron, 6,262,202 tons of Bessemer steel, 2,772,378 tons of open hearth steel, 415,299 tons of sheets, 404,746 tons of tin plate, 1,078.838 tons of wire and wire products, and 693,655 tons of tubes and pipes. The average number of employees in the service of the different companies constituting the Steel Corporation during the year was 158,263, to whom a total of $112,829,198 was paid in wages. The total pig iron production of the corporation in their first year was equal to 45 per cent. of the total production in the United States. The steel production was equal to 67 per cent. of the total production of steel in the United States.

The following is from the London *Ironmonger:* "Andrew Carnegie is said to have expressed a wish to have engraved upon his tomb the sentence: 'Here lies the body of a man who knew how to get around him men cleverer than himself.' In transmitting this from one side of the Atlantic to the other, the Associated Press of America omitted the small but, in this connection, all-important word 'him,' and so contrived to mangle the millionaire's meaning and subvert the sentiment entirely."

According to a statement issued by the Treasury Department the total amount of money in circulation in the United States on May 1 was $2,552,862,141, being a net increase of $59,337,491, as compared with the same date last year. This gives a per capita circulation of $28.66 based on an estimated population of 78,890,000.

THE NATIONAL ASSOCIATION OF STOVE MANUFACTURERS.

Those who remember the conditions which prevailed in the stove trade previous to the organization of the National Association of Stove Manufacturers have a keen appreciation of the good that has been derived from it and are most loyal in its support to-day. One of the results of its labors which is used with benefit by practically all the stove manufacturers in the United States is the system of computing cost, which was devised and presented largely as the result of the labor of the late John S. Perry. Previously stove manufacturers had arrived at the cost of their products by various methods, so that careful business men reached conclusions as to the cost of a stove of the same type that were so greatly at variance as to lead to sales which had a demoralizing effect on the whole stove trade. This was largely removed through the introduction of the cost computing system. During the administration of the late D. M. Thomas the cost system was modernized and perfected, so that its benefits are such as to lead to almost universal use among the stove manufacturers. This is one of the substantial things which the association has effected, and its importance cannot be overestimated.

Almost equally important was the annual gathering of men from widely separated districts, which afforded opportunity for an interchange of opinions and ideas, and eventually was influential in the organization of the local associations that have been efficient in the elimination of many evils from which the trade had previously suffered. The stove manufacturers in both their national and local associations have been satisfied to work up their cast iron into stoves, rather than to attempt the formation of cast iron rules by which the trade should be conducted. The association, notwithstanding, has had the effect of harmonizing prices and customs prevailing in different districts and on similar goods in probably as efficient a manner as if more positive methods had been attempted. The association has also had the effect of giving a healthy tone to the general market and of preventing to a large extent the invasion of different territories by outside manufacturers for the purpose of working off surplus product at prices that would be demoralizing.

There are those who have no hesitation in expressing their dissatisfaction with what the association has accomplished, but it is only necessary for these men to answer their criticisms by a reflection as to what would prevail in the stove trade if the influence of the National Association and the local bodies was withdrawn. The stove trade, both wholesale and retail, has benefited through this body of far seeing business men who are soon to gather at New York City.

The convention at Boston last year devoted some time to the discussion of the consolidation idea, and there can be no doubt that many members of the association secured information of great value when the captains of this branch of industry discussed the details that must necessarily be considered, perfected and observed in so great an enterprise as the consolidation of the stove manufacturers would be if effected. It is possibly due to the hope of securing further information along the same lines that there are indications at present that the attendance at the convention in New York next week will be so large as to break all previous records. A number of delegates throughout the Northwest have given assurance that they will be present, and from Chicago alone there will be 20 delegates. A special train will leave Chicago over the Lake Shore on Sunday night, May 11. All who have the best interests of the stove trade at heart will join us in wishing the manufacturers a successful meeting.

The Stove Founders' National Defense Association is a kindred body which will have completed its meeting at the time the stove convention convenes, and while devoted to a special object, it bears so important a relation to the welfare of the stove trade that all will wish it equal success in its deliberation and enterprise.

Entertainment by the New York Manufacturers.

As has been previously intimated, the stove manufacturers of New York City had no intention of allowing the members of the National Association of Stove Manufacturers to hold a convention in their city without giving them evidence that the honor conferred upon them was appreciated and extending courtesies in keeping with the honor. In consequence, Thursday evening has been selected as the opportunity for the enjoyment of a social entertainment after the convention has closed and its deliberations have been satisfactorily concluded.

The committee to provide the entertainment is composed of Peter B. Acker, Eugene Munsell, George W. Robertson, Henry T. Richardson, R. S. Horn, A. L. Canfield, Edward Bowditch, F. L. Sheppard, and E. F. Hill. After deliberation and consultation with their *confrères* in the stove trade, the committee have decided upon an entertainment similar to that which was so thoroughly enjoyed at the convention held in New York two years ago, and on next Thursday evening, at the Waldorf-Astoria, those who have been brought together by the stove convention will have an opportunity to extend their acquaintance and cement the friendships established, while a programme of diversion is presented.

The Late E. W. Fiske.

We present herewith a portrait of the late Eben Winslow Fiske, secretary of the Smith & Anthony Company of Boston, Mass., whose lamented death on April 29, at the early age of 42 years, was referred to in our last issue. Mr. Fiske was a son of the Hon. Eben W. Fiske, one of the most prominent citizens of Waltham, who was Sheriff of Middlesex County at the time of his decease. E. W. Fiske, Jr., had been connected with the firm of Smith & Anthony during his entire business life. He had been unwell for some time previous to his death, which was caused by Bright's disease. Mr. Fiske was an Alderman of Waltham three times, being President of the Board during his last term and filling the office with marked ability and fidelity. He never held any other public office. He leaves a widow and one son.

THE LATE E. W. FISKE.

The International Heater Company, Utica, N. Y., are about to erect a new building of brick construction, 110 x 150 feet, having a gravel roof supported by 12 iron columns. It will be used for foundry purposes, and will increase the molding capacity of the plant 75 per cent. The building will be constructed so as to furnish the best lighting possible, the plans having been prepared by F. H. Gouge with this idea in view. Scott & Yeomans have the contract, and it is expected that the building will be completed by July 1.

THE STOVE SALESMEN'S ASSOCIATION OF PENNSYLVANIA.

In the year 1896 three stove salesmen representing wholesale houses located on North Second street, Philadelphia, Pa., conceived the idea that it would be a good plan to form an association of stove salesmen, the chief object of which would be to promote sociability. Through the efforts of these three men a body was organized, known as the North Second Street Stove Salesmen's Association of Philadelphia, Pa., which proved to be of benefit to salesmen, inasmuch as it introduced a congenial, friendly and social feeling among competitive employees, thus assisting all of them to greater success in their vocation. Among the pleasant features of this organization were the annual banquets, generally held in the month of December. On these occasions salesmen representing competitive firms gathered around the festive board and, refraining from all "shop talk," would enter into the pleasure of such a convivial meeting as if it were some great family reunion.

The benefits of such an association were soon recognized by salesmen employed by firms located beyond Philadelphia limits, and as a number of them were desirous of becoming members, it was deemed advisable to accept all stove salesmen of good repute representing foundries and wholesale houses located in Pennsylvania. This took place in the year 1899, when the title of the organization was changed to the Stove Salesmen's Association of Pennsylvania, with headquarters at Philadelphia.

From the day those three traveling men promoted their idea until the present time there has been a steady increase in membership and a strong interest manifested, both by salesmen and employers. The association has received the indorsement of the leading foundries and wholesale houses in the stove business. The present year finds the association in a flourishing condition, and there seems to be even more enthusiasm among the members than heretofore. The officers and Committee on Ways and Means are putting forth a strenuous effect to secure all members possible in order that the number of stove salesmen at the next annual banquet will far exceed that of previous years. The association is now holding frequent meetings, and it has been decided to correspond with stove salesmen who are not members, but who represent foundries and wholesale houses in Pennsylvania, requesting them to join the organization.

An interesting feature connected with the stationery of the association is presented in the following cut, which was designed especially for the Stove Salesmen's Association of Pennsylvania by the secretary, W. T. Hallowell:

This illustration is very suggestive to every traveling man. All commercial tourists at some time during their experience on the road have traveled through territory in which towns were located at a distance from the railroad station. In such instances it has been the case that no conveyance could be obtained in which the traveler might ride to the inland town; hence there was no alternative except that he journey on foot with his grip in one hand and umbrella in the other. This illustration represents a stove salesman returning from an inland town with a good order, of course, secured from the best dealer there, and as he passes the first sign board on the outskirts of the town he consoles himself with the thought that he has 4 miles of terra firma to tread before reaching the depot. An experience like this is simply one of the minor hardships through which a traveling man must pass when on the road, and the purpose of the illustration on the stationery of the Stove Salesmen's Association of Pennsylvania is to show that a fellow feeling, as well as sociability, exists within the organization.

Under the present regulations of this body no benefits are paid in case of sickness, disability or death of a member, but if, in the course of time, a sufficient number of members should consider such a course advisable there would be a good field in which to institute a strong beneficial organization. The stove business is considered to be a legitimate vocation. Stoves are staple articles, and in this modern age are a necessity to mankind and rank next to food and raiment. Any person engaged in the sale of stoves follows a creditable profession, and it is fitting that men making such their life work should join themselves in an organization in order that they may become acquainted one with another, and while deriving a personal benefit from the social side may at the same time strengthen and uphold the high standard of the stove business. Any stove salesman representing a legitimate foundry or wholesale house may ascertain further particulars concerning the association by addressing the secretary, W. T. Hallowell, 111 North Second street, Philadelphia, Pa.

The Doyle Air Burner Company.

An effort is being made to locate the factory of the Doyle Air Burner Company, at Aurora, Ill. The company were recently incorporated under the laws of New Jersey with a capital stock of $2,000,000. The terms upon which the company are willing to locate at Aurora are the donation of a site of 20 acres and that citizens of Aurora subscribe to $100,000 worth of stock in the Doyle Air Burner Company, at par. A committee of three, consisting of D. W. Simpson, J. O. Mason and H. A. Uehren, have been appointed by the Merchants' Association of Aurora to canvass the matter thoroughly with a view to number the Doyle factory among the city's industries. It is believed by business men that little trouble will be experienced in securing the necessary subscriptions to the capital stock of the new enterprise as demanded by the Doyle Company. In fact, plans are being laid upon the assumption that the factory has already been secured and construction will be commenced in the very near future. The plant will consist of three buildings, a foundry, containing two cupolas, with a capacity of 25 tons of castings per day; a building in which to assemble the stoves, and a finishing shop.

It is believed by those interested in the enterprise that the introduction of the Doyle air burner will, to some extent, revolutionize the present method of heating buildings. The patent secured by F. J. Doyle, the inventor, has been investigated by a great many expert engineers, all of whom report very favorably. The letters patent are based upon the introduction of heated air at a point where it becomes thoroughly mixed with the gases as they arise from the consuming fuel and, igniting, cause a secondary combustion creating an intense heat. Under the old method of heating the gases were not ignited. Under the Doyle system it is evident then that there is a very large saving. The Doyle Company make the claim that, as compared with one of the best heaters on the market, it was found that for every 61 pounds of coal used by the furnace operated under the old method the Doyle stove required only 15 pounds 2 ounces to maintain the same temperature, a saving of a little over 75 per cent.

The officers of the company are: President, T. D. Hurley; vice-president, A. G. Thompson; secretary, Ed. E. McMorran; treasurer, John Cudahy; directors, T. D. Hurley, A. G. Thompson, E. E. McMorran, John Cudahy, F. J. Doyle, E. Humphrey, George W. B. Robins, T. J. Hudson, H. A. Frambach, J. H. Frambach and Jos. V. Clark. At present the Doyle stoves and furnaces are being manufactured at Chicago in a modest way.

The Arend Register Attachment.

The American Castings Company, Akron, Ohio, are placing on the market a new convex register equipped with the Arend attachment, for which patents are pending. In the ilustrations given herewith, Fig. 1 shows a broken sectional view of the register with the attachment ready to put into position, while Fig. 2 shows the register with the attachment placed in position. The attachment, which is illustrated in Fig. 3, is made of heavy tin and is so constructed that the instant the register is placed in position it adjusts itself automatically on one side to the hot air pipe, with stove pipe joint connection, and to the wood work or wall of the register on the other side, so as to hold the register in position securely and permanently, while at the same time absolutely preventing the escape of the hot air in the pipe otherwise than through the register opening. This attachment does away with the use of cement, screws or buttons to fasten the register, and also avoids the scorching and blistering of the paint or delicate decorations of the finished exposed wood work of the register box. It also saves considerable time in placing the register, all that is necessary being to have the hot air pipe extend from the box about ½ inch, this fitting into the register attachment similar to a stove pipe connection. Then the register is shoved into position and the job is instantly completed.

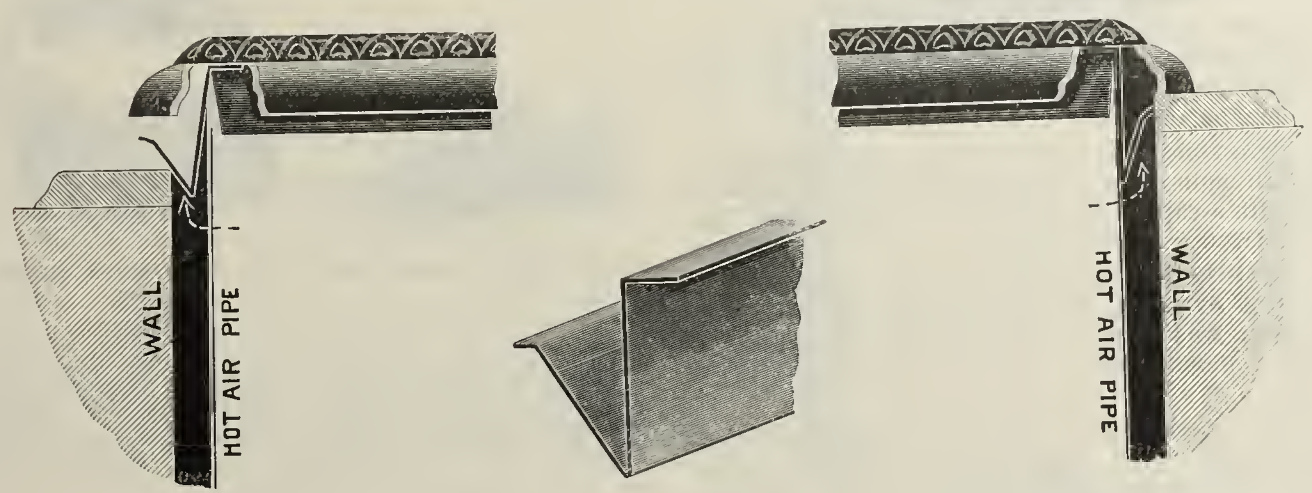

Fig. 1.—Broken View of Register, Showing Attachment.

Fig. 3.—Attachment.

Fig. 2.—Register in Position.

THE AREND REGISTER ATTACHMENT.

Welcome Furnaces.

A local paper of Syracuse, N. Y., states that the Syracuse Stove Works have secured the building formerly used by the Syracuse Wall Paper Company and will use it for the manufacture of a line of hot air furnaces, which they will call the Welcome. The building is 60 x 200 feet in dimensions and one story high. The company will remodel and adapt it to the production of hot air furnaces, installing all the modern facilities for producing them cheaply and to the best advantage. This building is adjacent to the present plant of the Syracuse Stove Works and is provided with both railroad and canal facilities for shipping. It is understood that the new plant will give employment to 50 additional molders, and that the company intend to be able to fill orders on the new Welcome line of hot air furnaces promptly when the fall season sets in.

The Keystone Stove Foundry.

Since the purchase of the patterns and the foundry of the Schuylkill Valley Stove Works, at Spring City, Pa., the plant has been running full and is able to fill all orders placed with it promptly. The new concern have had to refuse some large orders, owing to the present capacity being required for the regular trade and not being large enough to take care of the additional orders offered. The plant includes 7 acres of ground, and rumors are to the effect that material additions will be made to the present works to be able to meet the new demands made upon the concern. The new management have brought a great deal of enterprise to bear upon the business and have made some very important improvements and changes in the plant, its equipment and in the methods of operating which will soon place them in a more important position among the stove producing concerns of the country.

ODD PLATES.

The S. M. Howes Company, 40 to 46 Union street, Boston, Mass., are sending a circular to the trade calling attention to their exceptional facilities for handling Stove, Range and Furnace Repairs. A partial list is given of manufacturers for whose stoves, ranges and furnaces the company carry and are prepared to furnish Repairs at short notice. These include most of the best-known concerns in the trade. Attention is also called to the company's Boston Furnace Fittings and Boston Stove Pipe and Elbows.

The Fuller & Warren Company, Troy, N. Y., are sending to the trade their 12-page circular No. 17, printed on green paper with a green cover, devoted to the Ideal Stewart Range, which is of the French flat top type. This Range has been on the market a year, but this year appears with a reservoir that can be used on either the right or left hand, with 8 and 9 inch tops. Another feature is that two of these Ranges can be set as a twin for use in hotels or where a large cooking capacity is desired. The arrangement places two ovens in the center, with a fire box on each end, and gives an extra large high closet above. The company also make a little charcoal broiler for hotels where this Range is in use.

The Lawson Mfg. Company, Homestead, Pa., have been organized with a capital stock of $25,000, for the manufacture of Gas Stoves and Ranges, Burners, Water Heaters, &c. The company are equipping a three-story building at Homestead for the purposes of their business. The incorporators of the company are Lindsay S. Lawson, William H. Marley and William H. Johnson, all of Homestead.

The Mason Heater Company, Bellaire, Ohio, have purchased a building site, 171 x 520 feet, on which they will erect a foundry building 60 x 100 feet, also a three-story building 100 x 109 feet. This building will contain offices, salesroom and pattern room on the first floor. The second floor will be used for the manufacture of

Furnace Casings, Tin Pipes and other appliances. The shop will be fitted up with the latest improved machinery for the manufacture of heating goods. The third floor will be used for storage purposes. The plant is well located for shipping conveniences, having the Pennsylvania Railroad line on one side and the Baltimore & Ohio on the other. The company are already in possession of a number of orders and look forward to a good trade for their apparatus.

The Syracuse Heater Company, Syracuse, N. Y., are sending to the trade a green card printed in red and black, presenting a broken view showing the construction, fire travel, operation and large expanse of heating surface presented in the Twentieth Century Syracuse Heater, which they claim is one of the revelations of the age, and the only revertible flue base burner on the market. The card further states that a catalogue of the Heater will be mailed to those who desire it, on application.

The New Century Stove Company, recently organized at Moxham, W. Va., have secured a building which they will adapt for their purposes. They expect to have their plant in operation early in the summer.

The Glazier Stove Company, Chelsea, Mich., have just completed what is said to be one of the finest buildings in the State. It is three stories high and is built of dressed field stone with sandstone trimmings. In addition to the space for offices the building has storage accommodation for 40 carloads of Stoves. The company now have 200 men on their pay roll.

The Mound City Gas Stove Company, Wheeling, W. Va., are preparing plans for the erection of a large addition to their plant in order to meet the growing necessities of their business.

The Stamford Gas Stove Company of Stamford, Conn., with main office in New York City, have been organized with a capital of $60,000, by W. S. Horner, Warren Collins and I. F. Wardwell.

On May 1 the New York office of the Kelsey Heating Company of Syracuse, N. Y., in charge of Manager L. V. Sanford, was removed from 239 Water street to more commodious and convenient quarters at 156 Fifth avenue.

A pair of ice tongs in metal adorn a card which W. H. Colebrook & Sons Company, Syracuse, N. Y., are sending to the trade, calling attention to their Asbestos Furnace Cement and Stove Putty. As usual, the card bears an appropriate verselet in rhyme.

The Globe Steel Range Company, Kokomo, Ind., have started up their entire plant, the engine room, mounting room, pattern shop and fire proof pattern vault having been completely rebuilt. New equipment purchased includes a gas engine from Foos Gas Engine Company, Springfield, Ohio; large power gap shear from Toledo Tool & Machine Company, Toledo, Ohio; 250-light dynamo from Triumph Electric Company, Cincinnati, Ohio; line shafting, hangers, &c., from Ford & Donnelly, Kokomo, Ind.; pulleys from Reeves Pulley Company, Columbus, Ind., and belting, &c., from Charles A. Schleren & Co., Chicago.

The Gem City Stove Mfg. Company of Quincy, Ill., have recently registered the "Gem" and "Gem Heater" trade-marks.

The Abram Cox Stove Company have recently been making some improvements at their plant at Lansdale, Pa., with a view to increasing their facilities. The roof on the new addition has now been completed and workmen are busily engaged in enlarging the old building.

The proprietors of the Lizzie Lowman Stove Foundry, Sheffield, Ala., are about to further enlarge their plant. The company have been making good sized shipments of Stoves to California in the past week or two.

The Atlanta Stove Works, Atlanta, Ga., are operating very successfully in their new and enlarged plant. They have made several important improvements in their Stove patterns, and are producing a line of goods that are proving eminently satisfactory to their trade. The company have contracted for the output of the Alabama Mfg. Company of Birmingham, Ala., consisting of all kinds of Stove and Country Hollow Ware, English Pots, Kettles and kindred goods. With this adjunct to their business the Atlanta Stove Works expect to attract a larger custom than ever before.

Morris P. Borden, brother of F. M. Borden, the well-known Stove jobber of Philadelphia, died at his residence, 4836 Walton avenue, West Philadelphia, on Monday, May 12.

The Philadelphia Heater and Range Association of Philadelphia, Pa., will hold their annual meeting on Wednesday, May 14, at the Builders' Exchange in that city. The annual election of officers will be held and will be followed by a banquet. All dealers in Heaters and Ranges have been extended an invitation to be present.

Electrically Heated Devices.

United Electric Heating Company, 260 Randolph street, Detroit, Mich., have added to an extensive line of electrical apparatus suitable for the hardware trade several new articles, three of which are here illustrated. Fig. 1 represents a curling iron heater, features of which are its efficiency, cleanliness and freedom from fire and consequent danger. The heaters are particularly adapted to use in theater dressing rooms, hotels and other public places. Fig. 2 represents one of a very large assortment of laundry and pressing irons. They are especially efficient because practically all the heat generated is utilized, no heat being wasted in heating the atmosphere. The temperature can be regulated at will; the heat is sufficient and constant always, no time being lost in changing irons. The life of the irons is a term of years, all that is necessary in renewal even then being the replacing of the heating coil, which can be done at a slight cost. Fig. 3 represents an electrically heated chafing dish, which has the advantage over the ordinary chafing dish of entire absence of flame, fire, dirt and the odor of combustion, as well as being always ready for use by turning the switch, no matches or alcohol being required. The heater is removable, so that an alcohol lamp may be used where there is no electric current, and this heater may be attached to almost any chafing dish. Where this is done it is only necessary to adjust the legs so that the heater is held at the proper hight. The company have also adapted these heaters for use with hot water urns, and can supply urns fitted with the heaters, or they are prepared to supply heaters fitted to almost any urn. By the use of this electric heater it is possible by means of a switch to regulate the temperature and keep it constant at any point, giving the same results always under given conditions.

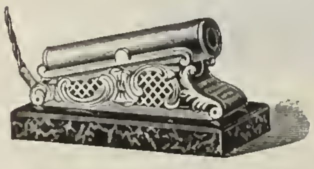

Fig. 1.—Electric Curling Iron Heater.

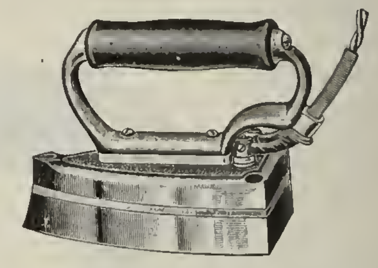

Fig. 2.—Electric Laundry Iron.

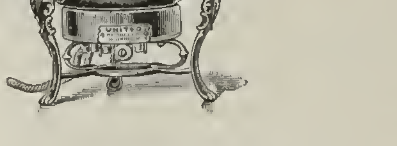

Fig. 3.—Electric Chafing Dish.

Brown Beauty Roaster.

Bronson-Walton Company, 1800 East Madison avenue, Cleveland, Ohio, for whom John H. Graham & Co., 113 Chambers street, New York, are direct representatives, are just putting on the market the Brown Beauty roast pan, here illustrated. These pans are made in the following sizes: 9 x 14, 10 x 12, 10 x 15, 11 x 16 and 12 x 17 inches regularly, it being the intention later to make larger sizes. The two wires seen on the bottom raise the pan so that its contents do not come in direct contact with the bottom of the oven, thus preventing any tendency to burn or scorch. The indentations in the top of the pan, seen in Fig. 2, cause the condensed steam to drip evenly over the roast, thus making the pan self basting, instead of running to one side if the oven is uneven. In the front is a ventilator, easily opened or closed. The handles are strong and have no sharp edges. The arrangement of the handles is such that they are stopped in a horizontal position, thus often preventing the burning of fingers when the pan is hot. The upper pan fits inside the edge of the lower pan and keeps the juices in the roaster. The pan is made of smooth steel, strongly wired, shellaced, and packed in heavy hardware paper in lots of six each, sealed at the end, so that they reach the retailer in clean and good order.

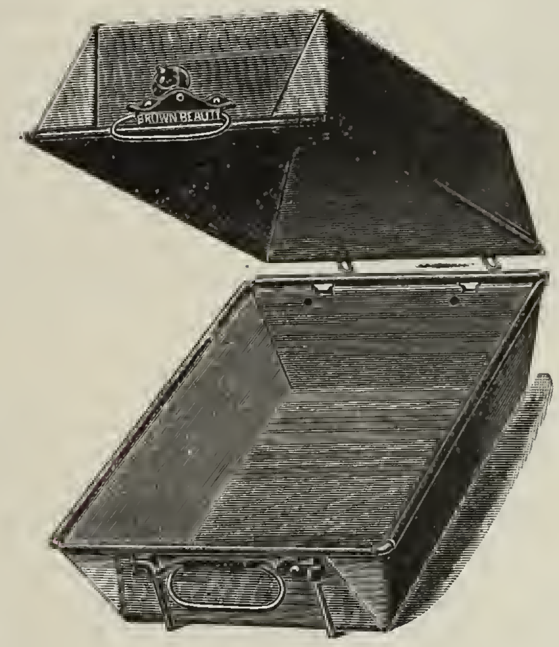

Fig. 1.—Brown Beauty Roaster, Open.

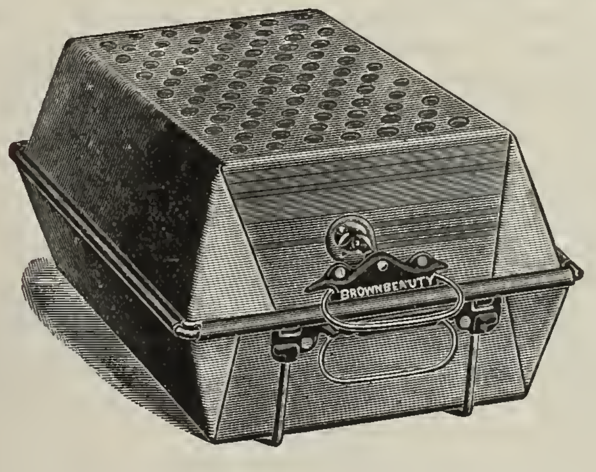

Fig. 2.—Roaster Closed, Showing Self Basting Device.

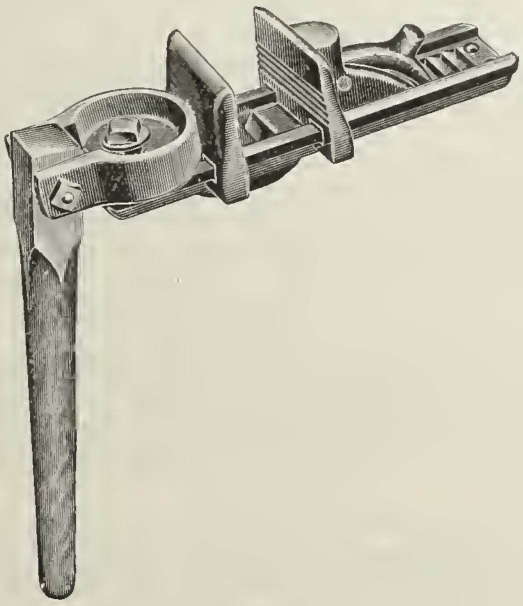
The H. E. Hessler Company of Syracuse, N. Y., have just purchased a large building on Hickory street, close to their present stores and warehouse, with a view to providing additional facilities for their business. The building is a four-story brick structure, covering an area 50 x 100 feet. An elevator is being installed and necessary alterations are being made for the proper equipment of the building so as to receive the heavy goods which are embraced in the tin shop supply department of their business.

Lightning Vise.

The Neverslip Tin Cover Company, Watertown, N. Y., have recently put on the market the Lightning vise, here illustrated. This vise can be quickly adjusted to clamp work in either a vertical or horizontal position, as circumstances may require. It is secured to a bench or other support in such a manner that the opening in the vise will align with an opening in the bench to which it is secured, so that a board or other object can be passed through the opening and clamped between the jaws. When clamping work horizontally the material can be placed between the jaws and the cam will force tightly against the object. By an adjustment of the bolt in the turntable the lever can be made to operate by moving either to the left or right, as occasion suggests. This device will firmly clamp objects with parallel or wedge shaped sides, the jaws being corrugated, which makes it especially desirable for use as a pipe wrench. There is also an opening in the base of the vise between the jaws which permits the passage of pipe or rod in a vertical position. The vise works rapidly and the rear jaw is quickly adjusted to any required position by lifting a dog which operates in notches at the back provided for that purpose. These vises are made regularly in three sizes—No. 1, weighing 4½ pounds; No. 2, 7 pounds, and No. 3, 11 pounds. They can also be made any size to accommodate different sizes of pipe, wood work or other articles to be held in this way.



Lightning Vise.

Stove and Hardware Dealers.

Western Wind Mill & Hardware Company, wholesale and retail dealers in Wind Mills, Hardware and Water Supply Material, have purchased the Hardware and Wind Mill business of Burton-Lingo Company, Midland and Big Springs, Texas, and of Johnson & Collins, Colorado, Texas, and will continue the business at all three points. The company have a paid up capital of $60,000.

P. W. Ziegler has succeeded Ziegler & Doran in the Hardware, Stove and Sporting Goods business in Manhattan, Kan.

The Columbian Enameling & Stamping Company, Terre Haute, Ind., are now regularly turning out their product of Enameled Steel Ware, which is claimed to have proved, on test, to be satisfactory in every way. While the company are not yet in position to fill all orders, as it takes time to educate their workmen in the manufacture of this line of goods, they expect shortly to be ready to supply the needs of the trade.

The American Household Hardware Mfg. Company were recently incorporated at Jamesburg, N. J., with a capital of $100,000. The incorporators are: Charles Holland, E. W. Rose and Franklin Mortimer. This company will build a plant for the manufacture of Household Goods in the Hardware line.

The Michigan Steel Boat Company, Detroit, Mich., are sending to the trade catalogues devoted to their patent Steel Boats, made for pleasure and hunting, and some of sufficient size to be propelled by means of motors. The Boats are made in a variety of styles, one being arranged to fold for use as a trunk and especially adapted to the requirements of hunters. It can also be used as a large packing case for conveying baggage to the camp.

F. D. Copsey has sold his Hardware and Stove business in York, Neb., to C. A. Schrandt.

Samuel K. Painter has sold his Hardware, Stove and Tin business in Lindsay, Neb., to C. J. Steiner.

Stein Bros. have succeeded O. E. Champe in the Hardware, Tinware and Sporting Goods business in Hastings, Neb. The new proprietors have remodeled the entire building, and now have three floors, each 44 x 130 feet, and one floor 44 x 50 feet.

E. D. Sargent, for several years past the Eastern representative of the White Mountain Freezer Company, has resigned his position with that company and will hereafter be associated with the Alaska Freezer Company, Winchendon, Mass., a new corporation chartered under the laws of New Hampshire for the manufacture of Ice Cream Freezers. It is understood that Mr. Sargent will be made treasurer of the new company.

The Peck, Stow & Wilcox Company, manufacturers of Tools, Machines and General Hardware, are said to have bought the entire plant of the Brittan & Mathes Company, Pittsburgh, Pa., manufacturers of Builders' Hardware and kindred lines of goods. It is believed to be the intention to transfer the business and plant in Pittsburgh to the company's Cleveland establishment about July 1.

The store of Whipple & Robinson, Glens Falls, N. Y., has been gutted by fire, and the firm will be pleased to receive catalogues and price-lists. Their line comprises Hardware, Stoves, Plumbing, Roofing, &c.

W. S. Shinn, who has opened a retail Hardware and Stove store at Eddyville, Iowa, informs us that he will be glad to receive catalogues and price-lists from manufacturers of goods in his line.

Trade Instruction at the Hampton Institute.

The thirty-fourth annual report of the Hampton Normal and Agricultural Institute of Hampton, Va., just published, shows that a highly successful educational work for colored youth is being carried on in that now famous institution. During the past winter term 1079 young men and women received instruction along various industrial lines at Hampton, while the Southern industrial classes in Norfolk and vicinity, which are under the care of the Hampton Institute's directors, had an enrollment of 1976, and the Huntington classes at Newport News and vicinity had an attendance of 807, which, with 347 attending last summer's Institute classes, make a total of 4209 pupils who were under the school's care in the past year. The importance of this effort for the elevation of the young colored citizens of the South and their education to the point of making them self supporting and self respecting members of the community can scarcely be overestimated.

Among the numerous departments into which the work of the Institute is divided, perhaps none is more important than the trade school, in which 168 male students were enrolled in the past season. A number of the boys, after spending a year in productive industry, working all day and attending school in the evening in order to obtain a sufficient credit balance to help carry them through the succeeding years of their course, take the next three years in the trade school, working in the shops during the day and giving the evening to academic work. These youths are given a comprehensive course of instruction in one or more trades. At present courses are provided in carpentry, wheelwrighting, harness making, bricklaying, blacksmithing, wood turning, tailoring, shoemaking, printing and bookbinding, the technical as well as the practical side of each trade being instilled into the pupils. Much of the product of the pupils is sold and thus furnishes a source of income to the Institute. All the pupils of the trade school receive instruction in mechanical or free hand drawing, in physics and in the ordinary English branches. It is intended this year to enlarge the trade school building and add a foundry to the facilities. In view of the increasing demand for skilled workmen in the South, such an institution as the Hampton Institute Trade School must be of immense value, not only in providing competent workmen, but also men who are qualified to teach trades to others.

Our Foreign Trade.

The United States maintains its position at the head of the world's exporting nations, despite the temporary reduction in the value of exports due to the shortage in corn available for exportation. The export figures for the nine months ending with March 31, 1902, as shown by the report of the Treasury Bureau of Statistics, indicate a drop of $58,681,957 in the total value of exports. When it is considered, however, that the value of corn exported fell, owing to the shortage in the corn supply, $52,000,000 below that for the corresponding period of last year, and that cotton, owing solely to a decrease in price, fell $12,000,000 below the exports of the same period of last year, the entire decrease is more than accounted for. Corn exports fell from 146,000,000 bushels in the nine months of the fiscal year 1901 to 24,000,000 bushels in the nine months of 1902. Cotton exports increased 344,000,000 pounds, but owing to reduced prices fell $12,000,000 in the total value exported. These two items—due in the case of corn to the shortage at home caused by the drought of last year, and in cotton to the reduced prices in the markets of the world—more than account for the reduction of $59,000,000 in the total exports.

Notwithstanding the reduction of $59,000,000 in exports, however, the grand total of domestic exports from the United States exceeds that of any other country. The figures of domestic exports for the nine months ending with March are: From the United States, $1,062,432,158, and from the United Kingdom, the next largest importer, $1,019,466,437. The latest available statistics show that the average monthly exportation of domestic merchandise from the United States exceeds that of any other nation, that the United Kingdom stands second, Germany third, France fourth, Netherlands fifth and British India sixth in the list of exporting nations. On the other hand the list of importing nations shows that the United Kingdom stands first, Germany second, France third, the United States fourth, Netherlands fifth and Belgium sixth in the relative demands upon the markets of the world.

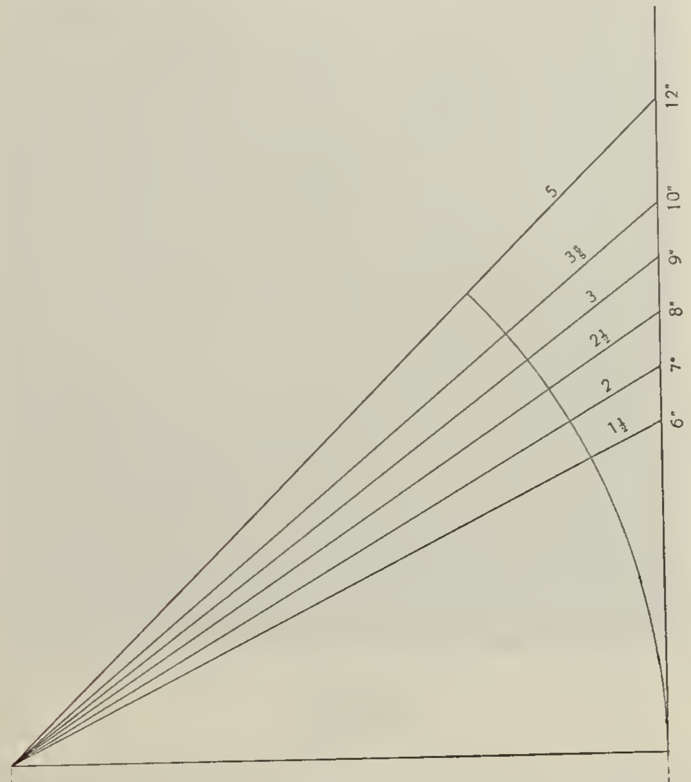
One especially marked characteristic of the commerce of the United States, in comparison with that of other countries, is its large excess of exports over imports. Of the 30 countries whose average monthly imports and exports are shown by the Bureau of Statistics only 11 show an excess of exports over imports. These 11 countries are Argentina, Brazil, Bulgaria, Canada, Chile, Egypt, British India, Mexico, Russia, Uruguay and the United States. The average monthly excess of exports over imports in the case of India amounts to about $9,000,000, and Russia also about $9,000,000, while that of the entire list of countries which show an excess of exports over imports (exclusive of the United States) amounts to but $38,000,000 per month, while from the United States alone the excess of exports over imports is as much as $42,637,127 per month.

John H. Cassidy, a well-known New York manufacturer and dealer in Gas Fixtures, died on Saturday, May 3, at his home in West Orange, N. J., aged 82 years. He was one of the oldest members of the trade in his line.

CALCULATING NUMBER OF SQUARES IN A ROOF.

BY I. N. PHILLIPS.

The following method of calculating the number of squares in a roof is submitted for the information of the readers of *The Metal Worker*, in the belief that it will be found to possess some advantages over the method of getting the length of the rafter and multiplying by the middle length of each section, in that it saves time occupied in poring over drawings when there may be others waiting for them. It also reduces the chances of making mistakes, where two or three are using the drawings at the same time. As a general thing, in residences having steep or Queen Anne roofs, the pitch is uniform, except on towers, and varies from 6 inches in 12 inches for quarter pitch, to 12 inches in 12 inches for half pitch. A favorite pitch in this section is 10 inches in 12 inches. Instead of measuring each section of roof plan separately and adding them up, an easier method is to measure the roof plan flat, as if it were to be covered like a floor.



Calculating Number of Squares in a Roof.—Diagram.—Scale, 3 Inches to a Foot.

Say that this amounts to 3000 square feet. Have at hand a diagram, like the accompanying sketch, which shows different pitched roofs, from 6 in 12 to 12 in 12. Divide the 3000 by 12, the length of the flat line, and multiply the quotient by 5, add the result to the 3000. The calculation will be as follows:

12 | 3,000 | 250
24 5
60 1,250
60 3,000
0 4,250 square feet in roof.

The correctness of this method can be proved by assuming a plain roof, 40 x 75 feet in the plan, which is 3000 square feet flat. With a roof 12 x 12 inches pitch, with ridge through the middle, the rafter is 56.7 feet over from eave to eave, as near as can be measured with a rule, which, multiplied by 75, gives 4252.5 square feet.

My method is correct, so long as the pitch is uniform. It is also quite simple. The multiplier 5 is what is left after the 12 inches is taken from the pitch line. If the pitch were 9 inches in 12 inches, the multiplier would be 3, as shown. Now, while the multiplier 3 is absolutely correct, 5 is a fraction too large, which can be demonstrated by the well known principle in geometry—viz., the square of the base added to the square of the perpendicular equals the square of the hypothenuse. But that is as near as can be measured on an ordinary rule, and it does not affect the correctness of the method. I mention this for the fellow who can see a fly on a church spire 1 mile off. If he wants to be excruciatingly exact, he can extract the square root of his multiplier, but the average Rosinhead knows very little about square root—and cares less.

The Amalgamated Sheet and Tin Plate Scales.

At the convention of the Amalgamated Association in Wheeling, W. Va., last week, the recommendations of the Wage Committee that the basis of scales as signed by the committee representing the Amalgamated Association, the Republic Iron & Steel Company, the American Sheet Steel Company and the American Tin Plate Company, were adopted. The following changes in the foot notes to the sheet and tin plate scales were suggested:

Memoranda of agreement:

The second clause in the memoranda of agreement was amended by striking out the figures "160" in the second line and inserting "130" instead.

New clause desired for memorandum of agreement:

"5. Finishing mills will be allowed to work three turns when practicable. On finishing mills working or desiring to work three turns, eight hours shall constitute a day's work. Rolling shall not start earlier than 5 a.m. Monday morning, and first furnace shall cease charging at 11.30 a.m. on Saturday. The last furnace shall not charge later than one hour after the first furnace and close the week's work. On all mills working three turns a third roller shall be employed."

SHEET MILL SCALE.

Substitute for foot note 4: "All sheet iron or sheet steel shall be weighed by the company after being sheared and opened, and the company shall furnish the complete weight of each turn to the roller, or put the same in a convenient place."

SHEET MILL HANDS' SCALE.

Add to foot note 11, these words: "This to apply only to sheets 60 inches long and shorter lengths."

ROUGHING AND CATCHING ON SHEET AND JOBBING MILLS.

The above change to be incorporated in the roughers' and catchers' scale.

TIN MILL SCALE.

"1. That the screw boys do not bundle any scrap ends, scrap to be bundled by the company."

"2. That all tin mills be paid at least every two weeks."

"3. That as a counter proposition to the three years' scale we propose to agree on conditions that we get the Cleveland 1900-01 scale and foot notes, with the same conditions as then prevailed, where now practicable."

"4. And when in the judgment of the manager and the mill committee the work is too heavy for the catcher, extra help shall be furnished."

"5. That when dirty bars are supplied for tin mills the company shall furnish a man to sweep them, and that the crew shall not be held responsible for dirty iron. The crew shall be paid for production per mill for such iron put in by the company."

"6. That no more level hand jobs be given in tin mills, and level hand men be singled out as soon as a vacancy occurs."

"7. That 10 per cent. extra shall be paid for 40 gauge when doubled three times.

MOREWOOD STACKS.

That the Morewood scale shall end July 15.

SHEET AND TIN BAR SCALE.

New foot note:

"1. That the price paid for drag down on sheet bar mill be one-third the price of heater's price."

"2. That the drag down from furnace to rolls on sheet bar mill have a scale of about 14 cents per ton.

Conferences will be held at an early date between wage committees representing the Amalgamated Association and conference committees representing the Republic Iron & Steel Company, the American Tin Plate Company and the American Sheet Steel Company. However, no date has yet been set for these conferences.

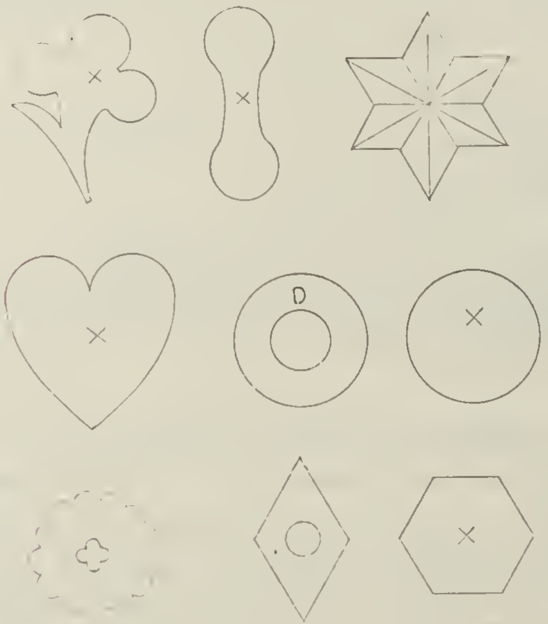
THE AMERICAN TIN PLATE COMPANY'S large plant at Monessen, Pa., is running full time in all departments. Two new mills from the dismantled plant at Johnstown, Pa., are being added to the equipment of the Monessen works. The new mills will probably be started early next week. It is said that the company are contemplating an increase in the capacity of this plant, adding a number of new Jumbo stacks.

Wreck at Shenango Tin Plate Works.

A cyclone which struck New Castle, Pa., on the afternoon of May 6 caused serious damage to the great Shenango works of the American Tin Plate Company, at that place, the largest plant of its kind in the world. Every stack above the 30 mills comprising the plant was broken off, many of them being whirled through the roof of the building; steam pipes were broken and torn away, and the roof was crushed in. The 2000 men employed at the plant were panic stricken by the darkness and blinding steam, but happily all managed to escape without serious injury. The wind which caused the wreck came from the southwest. It was preceded by a period of extreme sultriness, which greatly affected the men at work in the mills. Shortly after the cyclone arrived with a frightful rush, and the tin mill, which lay directly in its path, suffered the greatest injury, comparatively little damage being done elsewhere in the city. The damage to the works is estimated at about $100,000, and several weeks will be required to get the mills again in running order.

CAKE CUTTERS.

Bright pieces of scrap tin can be utilized to make lady finger, patty, biscuit, doughnut, cookey, cake, animal, tart and muffin cutters. These are easily made, prove attractive, and sell readily if an assortment of forms is kept on hand. In Fig. 1 is shown a variety of simple forms. To make the full sized drawings of these figures the method shown in Fig. 2 may be used. Divide the length of the smaller outline into an equal number of spaces, as shown by the small figures 1 to 8, and the hight into any number of equal parts, as shown from *a* to *g*. Through the small figures 1 to 8 and letter *a* to *g* draw lines at right angles to each other, intersecting each other, as shown, and crossing the outline of the figure.



Cake Cutters.—Fig. 1.—Simple Forms.

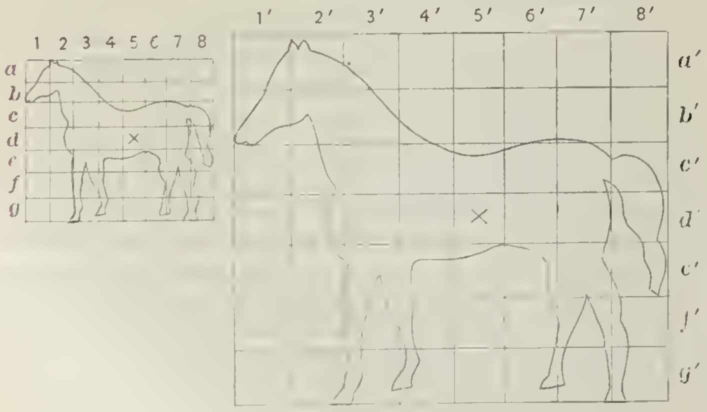


Fig. 2.—Method of Enlarging Figures.

Now assuming that the outline of the horse is to be made twice the size of the small diagram, then set off a distance equal to twice the amount of 1 to 8, as shown by 1′ to 8′, and twice the hight *a g*, as shown by *a′ g′*. As 1 to 8 is divided into eight parts, and *a g* into seven, then divide 1′ to 8′ into eight parts and *a′ g′* into seven, respectively. Through points 1′ to 8′ and *a′* to *g′* draw lines at right angles to each other, as shown. Now, following the smaller diagram as a guide, the large one is traced through corresponding squares. In this manner any figure can be enlarged to any size. If the outline was required six times as large as the small diagram then would the length 1 to 8 and hight *a g* be made six times as large, then divide the spaces thus obtained into the same number of divisions as in the original diagram. In Fig. 3 is shown an outline of a bird and barking dog. These or any other figures can be enlarged, using the above method.

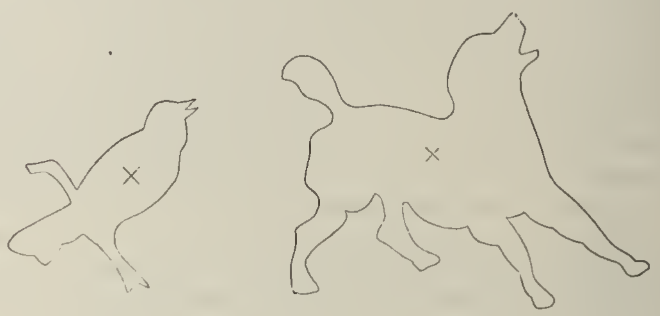

Fig. 3.—Bird and Dog.

The cutters are constructed as shown in Fig. 4, in which A represent a flat piece of tin of the required size, onto which strips of tin ⅜ inch wide, which have been formed to the outline of the figure desired, are tacked with solder at *a* and *a*. Then a handle, shown at C, about ½ inch wide, with a hem edge bent toward the inside, is soldered to the flat disk A at *b* and *b*. A ½-inch hole should be punched through the center of the disk, shown by the arrow point, also as is shown in all the diagrams by X in Figs. 1, 2 and 3, which allows the surplus dough to pass out at the top when cutting the various figures. D in Fig. 4 shows a perspective view of a doughnut cutter, showing how the handle and strips are put together, being the finished article of D in Fig. 1.

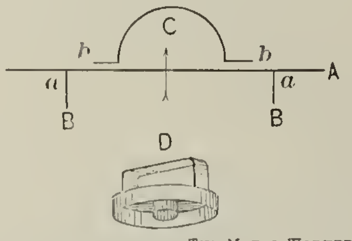

Fig. 4.—Construction of the Cutter.

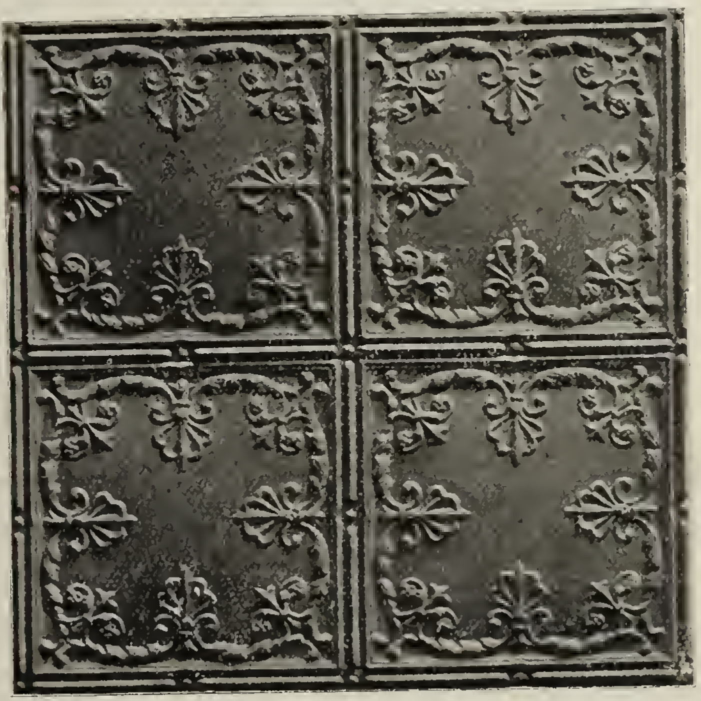
An Australian Visitor

F. Malley, a manufacturer of sheet iron, tin and zinc work, at Liverpool and Kent streets, Sydney, New South Wales, Australia, was a visitor at *The Metal Worker* office this week. Mr. Malley is spending a few weeks in the United States, having landed at San Francisco about a month ago. After visiting some of the Eastern centers he will return home by way of London. He is especially interested in the modern developments in the use of sheet metal, and is acquainting himself with American practice in this line. He would be pleased to receive at his home address the catalogues of manufacturers of metal ceilings and side walls and architectural sheet metal work of all kinds, also metal roofing and cornices. Mr. Malley regards Australia as a promising field for these materials.

A great deal of galvanized iron is used for construction work in Australia, a large proportion of the buildings in some districts being roofed with this material. Most of the galvanized iron now used in Australia comes from the United Kingdom, but under the new Australian tariff the prospects of opening up a market for the American product are more favorable. It would probably repay the manufacturers of the United States to give some attention to the Australian market. Efforts are now being made to start the manufacture of galvanized sheets in Australia, but very little headway has been made as yet in that direction, the work having hardly progressed beyond the experimental stage.

Sheet Metal for Interior Decoration.

The Canton Steel Roofing Company of Canton, Ohio, with New York agency at 157 West Twenty-third street, manufacture a fine line of stamped steel ceilings, side walls and interior decoration generally. Herewith are presented some designs in this line which they have recently gotten out. In Fig. 1 is shown a ceiling plate of Colonial pattern, simple but pleasing in effect. These plates are furnished in 24 x 48, 12 x 48, 24 x 24 and 12 x 24 inch sizes. A ventilating center, also of Colonial design, 24 x 24 inches in size, is given in Fig. 2, while Fig. 3 shows a handsome wainscot plate of Rococo design, 12 x 24 inches in size. These patterns are new and original, and admit of a high degree of ornamentation. The manufacturers point out that their plates are resheared on all sides after being stamped, and thus will line perfectly straight and regular, making it immaterial which way the plates are lapped.



Sheet Metal for Interior Decoration.—Fig. 1.—Ceiling Plate, Colonial Design.

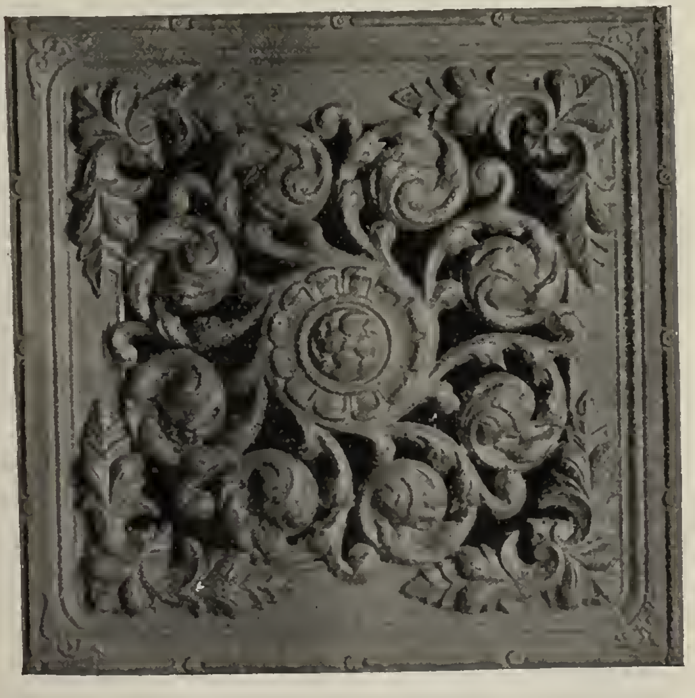


Fig. 2.—Ventilating Center, Colonial Design.

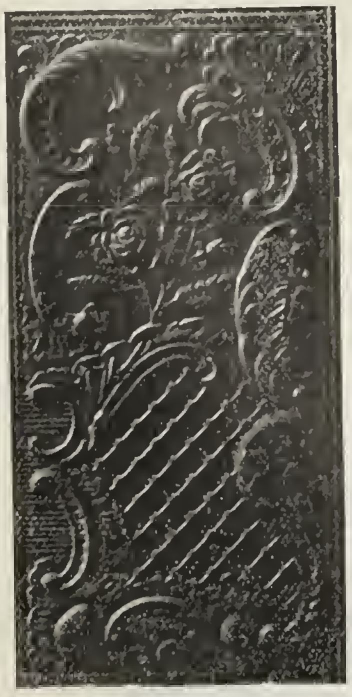

Fig. 3.—Wainscot Panel, Rococo Design.

Death of William H. Leitch.

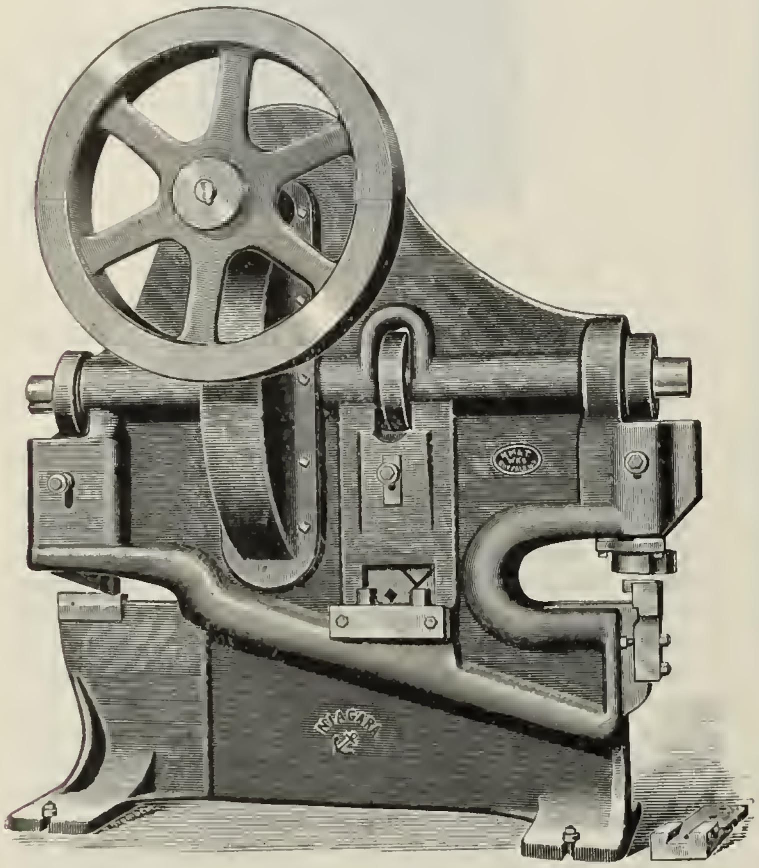
William Hardie Leitch, general manager of the Jersey City Galvanizing Works of Jersey City, N. J., died suddenly on Friday, May 2, at his home, 373 Madison street, Brooklyn, N. Y., as the result of heart failure induced by stomach trouble. Mr. Leitch was born at Allegheny City, Pa., 52 years ago, but had lived many years in Brooklyn, where he was well known in commercial circles. He had been connected with the Jersey City Galvanizing Works for a long period, and had been treasurer of the New York Manufacturers' Association since its organization. Mr. Leitch was prominent in church circles in Brooklyn, and was an active member of the Central Presbyterian Church of that city. He was also a member of many fraternal societies. He is survived by his widow and daughter and one son. The funeral services were held at his late home on Monday evening, the Rev. Dr. John F. Carson officiating. The interment was at Brewsters, N. Y.

The Dowman-Dozier Mfg. Company.

Under date of May 1, the Dowman Mfg. Company of Atlanta, Ga., George Dowman, president and general manager, announce that on account of the great increase in the business of the company, it has been found necessary to enlarge their factory in order to meet the growing demands of the trade. Accordingly, a new company has been formed, known as the Dowman-Dozier Mfg. Company, which began business on May 1 at the location formerly occupied by the Dowman Mfg. Company, 20 and 22 Trinity avenue, Atlanta. The new company, on account of increased capital and improvement in their plant, will enjoy exceptional facilities for doing the best work which modern power machinery can accomplish. Their line of manufacture includes architectural sheet metal work, galvanized iron and copper cornices, metal skylights, finials, crestings, &c., tin, slate and iron roofing, eave trough, conductors, hot air furnaces, Dixie ventilators, metal ceilings and tinners' supplies. The officers of the new company are George Dowman, president, and G. P. Dozier, secretary and treasurer.

The Niagara Combination Punch and Shear.

The shear part of the combined punch and shear built by the Niagara Machine & Tool Works of Buffalo, N. Y., and illustrated herewith, is intended for cutting plates or flat bars up to ½ inch thick. The punch portion, having a 12-inch throat, is suitable for plates and bars, also for punching the flanges and webs of I-beams, angles and channels. The capacity is a ¾-inch hole through ½-inch iron. The center part is intended for cutting off flat and round bars, angles and T bars, and it performs this work without deforming the profile. The machine is driven from tight and loose pulleys, worm and worm wheel, and has a very heavy fly wheel. The belt shifter is adjustable for drive at any angle. The worm wheel is entirely inclosed and runs in an oil bath. The end thrust of the worm is taken up by ball bearings to insure smooth running. A forged steel shaft runs the entire length of the machine, in bronze bearings at the ends, and carries three eccentrics, one for each of the working parts. The motion is conveyed to any of the slides by shifting a wedge between the proper eccentric and slide. The motion continues while the wedge is in place, and the slide will stop at the highest point after the wedge is withdrawn. To make the shear suitable for splitting sheets of any length and width the frame is made with an offset that allows the free passage of the two parts of the sheet, as far as it can be cut apart, one part going downward and the other continuing horizontally. The knives are made of solid tool steel, and adjustment is provided to take up wear. The punch is furnished with two die holders, one of them being suitable for punching holes in the web of I-beams and channels and the other for punching holes in flanges. Either one of the die holders will answer for plates and flat bars. A stripping attachment is fastened to the frame of the machine. The center part carries a set of knives for cutting off square and round bars, as well as for angles and T-bars, up to 3 inches. No exchange of knives is required for these various shapes.



The Niagara Combination Punch and Shear.

PERMANENT organization of the recently organized Monarch Iron & Steel Company was effected at a meeting held in Pittsburgh last week. The plant of the company at Parkersburg, W. Va., is nearing completion and will be ready for operation in July. As before noted, the product will be Planished Iron Sheets, manufactured under the Broomall patents.

Steel Ceilings Abroad.

Richard Lewis, who is well known in this country, having been for a number of years manager of the Norristown Tin Plate Works, at Norristown, Pa., has returned to Wales, his native country. An article in the English papers shows that Mr. Lewis has imbibed some good ideas during the years he has spent in the United States. He has taken over and is exhibiting at Swansea a number of samples of soft steel stamped sheets, such as are now so generally used in this country for interior decoration construction work, in the way of ceilings and side walls. It is said that Mr. Lewis intends to build a house in Swansea in which sheet metal decoration will be used throughout. There is not, up to the present, any establishment in England or Wales where sheet metal for interior decoration is manufactured. It would seem that there should be a large field for this class of goods in the United Kingdom. American steel ceilings and side walls have already been sent to South Africa and Australia, but do not appear to have made as yet the successful advance in these countries that was expected and which their merits should command. This comparative failure is probably due to ignorance on the part of the foreign sheet metal workers as to the best method of erecting steel ceilings and side walls. The art once learned, however, there is every reason to expect that these materials will become as popular in other parts of the world as they are to-day in the United States.

FLASHINGS.

THE annual convention of the Tin Plate Workers' International Protective Association gathered in New Castle, Pa., on Tuesday, May 6. The American Tin Plate Company have offered to sign the tin house workers' scale for the year beginning July 15, 1902, on the same basis as at present. It is probable that this proposition will be accepted.

FOLLANSBEE BROTHERS COMPANY, Pittsburgh, Pa., are sending out their usual monthly blotter in the interests of Follansbee's Roofing Tin Plates. A game of baseball is used to illustrate the issue for May, the point being that the trade will "make a hit" by using the firm's Roofing Plates.

THE PENN METAL CEILING & ROOFING COMPANY of Philadelphia are doing a large business at their Boston office, 18 Harcourt street, where they carry a complete line of the fine designs manufactured by the concern. This branch now has contracts for furnishing Ceilings in a number of important buildings, among them being a theater at Norwich, Conn., which will require 17,000 square feet, and a Boys' Club building, at Pawtucket, R. I., which will require 18,000 square feet.

THE BOSTWICK STEEL LATH COMPANY, Niles, Ohio, who at one time contemplated the removal of their plant to some other town, have decided to remain in Niles, having been able to secure a site on which they will erect a larger plant.

IT is reported that a Sheet mill is to be erected in connection with the new plant of the Louisville Boiler & Iron Company, Louisville, Ky. Davis, Kelly & Co. of Louisville, iron and steel merchants, are understood to be the promoters of this enterprise.

THE title of the firm of George C. Fuhrman & Co., 93 West Main street, Springfield, Ohio, manufacturers of Galvanized Iron and Copper Cornices, &c., has been changed to the Fuhrman-Follrath Company, William D. Follrath, who has been foreman for the concern for a number of years, having been admitted as a member of the company. In addition to manufacturing Galvanized Iron and Copper Cornices, Finials, Crestings, Ridgings, &c., the company make a specialty of tin, steel and slate roofing and spouting, and deal in and install Hot Air Furnaces, Stoves and Ranges.

THE improvements which the American Sheet Steel Company are about to make at their Old Meadow Mills, at Scottdale, Pa., will consist in the introduction of labor saving devices and of electric power in many of the departments in which steam has been used. Similar improvements are also to be made at the company's Scottdale mill in the same place. Both these plants will be thoroughly modernized with the object of securing an increased output.

The Niles Galvanizing Company of Niles, Ohio, have been incorporated with a capital stock of $10,000, to manufacture Galvanized Iron. The incorporators are H. J. Robbins, George B. Robbins, F. C. Robbins, W. H. Smiley and F. W. Stillwagon. It is understood that the capital of the company will shortly be increased.

The United Engineering & Foundry Company have purchased the Apollo Iron & Steel Company's foundry at Vandergrift, Pa., which was built a number of years ago for the manufacture of Rolls for use in rolling mills. The controlling interest was held by the Vandergrift estate, George G. McMurtry and Joshua Rhodes. Although operated in connection with the Apollo Iron & Steel Company and owned by the same interests, it was always a separate organization. The acquisition of this foundry gives the United Engineering & Foundry Company four large foundries, which together will have the greatest output of Rolls of any concern in the world.

Powers & Williams, Streator, Ill., issue a circular to the trade announcing that they have now completed and placed in operation a finely equipped factory for the manufacture of Skylight Glass. They have the latest system of leers and guarantee the Glass to be flat, well tempered, and in every way satisfactory. With their large capacity and good shipping facilities they claim that they are able to supply the demands of the Skylight trade for Grass, either in cut to size orders or in stock cases. The company are making Ribbed Glass of 1/8, 3-16, 1/4 and 3/8 inch thickness, and Rough Glass of 3-16, 1/4 and 3/8 inch. They are also manufacturing Window Glass of all kinds, as well as the Powers Automatic Chimney Top, the merits of which are well known to our readers.

James A. Miller & Brother, Chicago, Ill., are calling attention to the Corrugated and other Iron Roofing, Skylights, Cornices, Conductor Pipe, Gutter and similar lines, of which they carry an extensive stock and are prepared to fill orders with all reasonable dispatch.

The Moncrief Plumbing & Tinning Company, Jacksonville, Fla., began business in July last and are incorporated under the laws of the State of Florida. The president of the concern is R. L. Moncrief and the secretary Robert C. Trimble. On April 1 they opened in Atlanta, Ga., a branch manufactory, of which D. E. Moncrief is the manager. The company manufacture Skylights, Cornices and anything in the sheet metal line, and also do tin, iron and slate roofing. They purpose doing business over the whole of the Southern States, shipping from either Jacksonville or Atlanta, according as freight rates favor.

The Wheeling Mold & Foundry Company, who recently completed a large plant at Wheeling, W. Va., for the building of Rolls and Rolling Mill Machinery, have received a contract for the Sheet and Tin Plate mills for a new plant to be erected at Marietta, Ohio. They also have a contract for a large amount of Tin Plate Machinery for the new works of the McKeesport Mfg. Company, at Port Vue, McKeesport, Pa. The Wheeling Mold & Foundry Company will double their capacity for making Chilled Rolls, having a great many orders for these on hand.

The Empire Iron & Steel Company, a new corporation, who are building a Sheet mill plant at Niles, Ohio, have let the following contracts: Roll train for Sheet mills, to the Globe Foundry & Machine Company of Niles, Ohio; traveling crane, to the Case Mfg. Company, Columbus, Ohio; main buildings, to the American Bridge Company; boilers, to the Stirling Company, Barberton, Ohio; electric plant, to the Akron Electrical Mfg. Company, Akron, Ohio, the generator to be connected to a Brownell engine.

The Berger Mfg. Company of Canton, Ohio, manufacturers of Metal Roofing, have decided to erect an addition to their plant. The improvements provide for an addition to the cutting and painting department and a new blacksmith shop.

A report has gained currency that the Great Western Tin Plate Works of the American Tin Plate Company, at Joliet, Ill., which have been idle for some time, are about to resume work. The capacity of the plant is to be increased by the addition of new machinery.

The Youngstown Foundry & Machine Company, Youngstown, Ohio, builders of rolls and Rolling Mill Machinery, have recently bought considerable ground adjacent to their plant, which will be used at some time for extensive additions to their works. They have recently received a second 15-ton electrical crane, which is now being installed.

The Harrington & King Perforating Company, Chicago, have issued an announcement to the trade, under date of May 1, that they have removed their New York office to 114 Liberty street, in the new Engineering Building, situated in the heart of the machinery district, where with all the conveniences of modern equipment and a full line of samples they are prepared to give quotations as low as strictly first-class work will permit. They refer to the output of their Chicago plant as embracing every department of Perforated Metal Work, from the finest to the largest of perforations, and of such a variety of shapes of openings, in light and heavy metal, that scarcely any specification is beyond their reach.

The Mesta Machine Company, Pittsburgh, Pa., have a contract for a pair of 50 x 60 horizontal reversing engines for the Sheet mills of the Alan Wood Company of Conshohocken, Pa.

It is reported that the Barrett Mfg. Company, Chicago, Ill., in connection with the recent consolidation of manufacturing concerns making Tarred Roofing Papers and Coal Tar products, have bought the N. West Department of the Cambria Steel Company, which was the largest remaining competitor. The N. West Department, using the waste product of the Cambria Company in the latter's manufacture of coke, had become a factor in the business, the enterprise having been started a few years ago on account of the low price for Coal Tar paid by the Barrett Mfg. Company.

Drinking Water for Workmen.

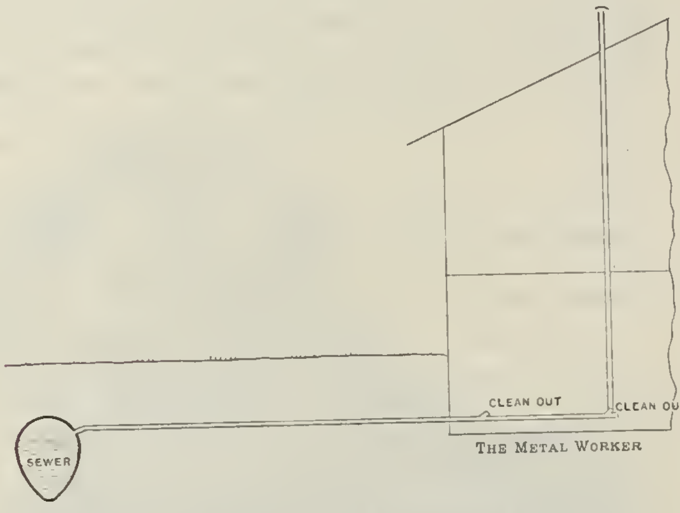
B. F. Avery & Sons of Louisville, Ky., describe as follows their experience in furnishing prepared drinking water to their workmen during hot weather, especially those employed in their forging, foundry and other departments where there is intense heat. They take stone jars or kegs holding about 10 gallons of water, filled with water and a small quantity of ice, pack the jar in a barrel with sawdust between the inner and outer vessels. Thus the water is kept cool with a minimum of ice. Each morning they place about 1/2 pint of oatmeal, rolled oats or any other form of crushed oats in the water. This crushed oats thus used makes the water a remarkable thirst quencher. During the several years that they have thus provided drinking water they cannot recall a case of heat prostration or illness due to excessive drinking of water by men employed in their shops where the heat is great. They also find that this water reduces the appetite for intoxicating drinks, and in general the effects are so excellent that their men are telling it to workmen in other shops and cities. The jar should be emptied and thoroughly cleansed every morning, as the oatmeal sours over night, and, of course, the drinking cup also ought to be scalded and scoured for obvious reasons each day. They believe that the water should be drawn from a spigot, as, of course, from a sanitary view the use of a dipper in the top of the jar is not as it should be, but the oatmeal clogs the spigot or strainer leading to a spigot. It has contributed not only to the comfort of the men, but has permitted them to continue at work when the heat might otherwise have prevented and has greatly reduced the temptation of the men to seek intoxicating cooling drinks. For a few days the oatmeal flavor may not be relished by all of the men, but very soon they find it palatable and are delighted by the relief afforded.

Sewer Connections Without Intercepting Trap.

While the use of the intercepting trap, or front wall trap, on house drainage systems is, in the majority of instances, required by law, there are some places where it is prohibited by law, and in others, where there are no laws on this subject, the plumbers use their judgment as to the use or omission of this device. We present below communications from a number of cities where the intercepting trap is either not in use or where its use is left to the option of the plumber, which, no doubt, will prove of interest to the plumbing trade:

A plumber in Alliance, Neb., says:

In my opinion all house sewers should connect with the main sewer by means of a 45-degree bend, instead of running into it at right angles. If the house sewer is in soft ground it is better to use extra heavy cast iron pipe, but if the ground is of such a character that it will support the pipe, I believe that glazed tiling is equally good for the purpose. I think that from the house to the sewer there should be a pitch of at least 2 inches to 10 feet, and the connection should be made at a point between the center of the sewer and the top. At the point where the soil pipe passes through the wall there should be a Y-branch, and the house sewer should connect into the Y side, leaving a straight run, so that it can be opened to remove any stoppage by means of a rod in case of necessity.



Sewer Connections without Intercepting Trap.—Fig. 1.—A Nebraska Connection.

In regard to the house trap, some people prefer them, but I am opposed to their use on the ground that the more stoppages that are presented to the escape of the gas that may be generated either in the sewer or the drainage system, the greater will be the force it will exert in order to get out where it is not wanted; so I omit the trap and provide a vent pipe, which runs through the roof of the house. If the main sewers are ventilated through the manholes in the street there should be a movement of air which will prevent any excessive generation of gas. It is far better to prevent and avoid trouble than it is to overcome it. If a good drum or anti-siphon trap is used on each fixture there will be no trouble with the plumbing system.

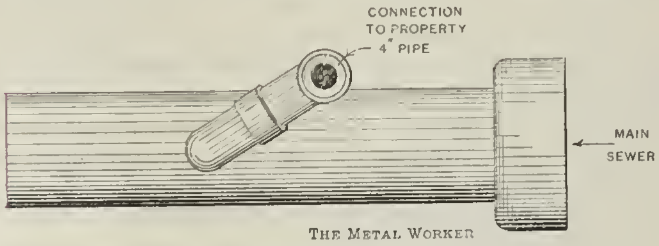


Fig. 2.—A Terra Cotta Sewer Branch.

I give, in Fig. 1, an illustration of ideas as to how the house sewer should connect with the main sewer and where the clean outs should be located.

A correspondent in Jacksonville, Fla., writes as follows:

Our system of sewerage is what is known as the Waring or Memphis system, consisting of one or more trunk lines with small laterals; consequently we have no intercepting traps, as each separate sewer connection contributes its share toward the ventilation of the street sewer. Our connections at the juncture with the street sewer are invariably made with terra cotta or glazed sewer pipe, the main sewer having a Y-branch, which is set at a slight angle, as shown in Fig. 2. Then a terra cotta one-eighth bend is inserted into the Y at that point which receives the terra cotta house drain, which is run to a point just outside of the wall. It will thus be seen that the connection at the sewer will be slightly above the level of the main sewer in the street. We find that a fall of ¼ inch to the foot is good practice, but have had to get along with much less, because here in many places the sewer is not very deep, owing to quicksands.

A correspondent in Mason City, Ia., writes:

The regulations of our city permit terra cotta sewer pipe that is salt glazed to be used from the sewer up to a point within 5 feet of the building, where it is continued on, using extra heavy cast iron soil pipe. A fall of less than 1 foot in 60 feet is not allowed, and the house sewer has a sharp downward pitch at the point of connection in the main sewer. We use no intercepting trap at the front wall, but an individual trap at each fixture, with a vent connection of the full size of the trap attached near the crown. Our city being located on a bed of natural rock our walls settle very little; consequently we have no trouble with breakage of the house sewer where it passes through the wall.

A plumber in Canton, S. D., says:

Our method of making sewer connections with the street sewer is in accordance with the State laws, which compel the city to put a 6-inch Y-branch on the main sewer line at every lot. In making the connection, we begin by taking out the cover or stop in the branch. Our sewers are generally made of salt glazed terra cotta sewer pipe. We use 6-inch pipe from the sewer to a point within from 6 to 10 feet of the house, and then 4-inch or 6-inch extra heavy cast iron soil pipe into the house and up through the roof without any intercepting trap, the piping being arranged as shown in Fig 3. We then back vent the traps on all the fixtures either by an extra pipe or carry up a separate vent pipe to the main vent stack in the attic. We have found that ⅛ inch to the foot makes a very good fall, but sometimes use 1 inch in 10 feet. We have had the best results by not using the trap on a sewer connection, but always leave a clean out plug at the bottom. I prefer to leave a clean, open passage for the air from the sewer up through the house system and out through the roof. This prevents, through the frequent and rapid circulation of air due to winds, any generation of obnoxious gases.

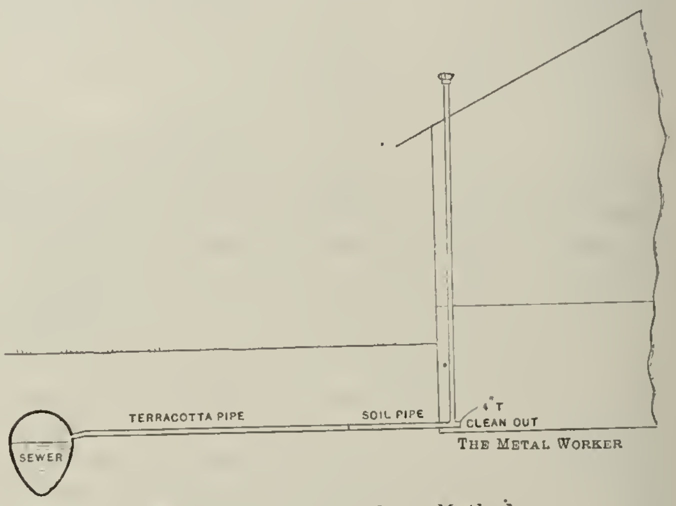

Fig. 3.—A South Dakota Method.

In the opinion of a plumbing house at Fort Worth, Texas, no terra cotta pipe should be placed inside or under any building, but instead extra heavy cast iron soil pipe, properly coated with prepared tar, should be used until a point a few feet beyond the building line is reached, when salt glazed terra cotta pipe may be used. They add:

The connection to the main sewer, whether it is made of pipe or brick, should be as high in the main as the fall will permit. The house sewer should have a uniform pitch all the way down, if possible, to the point of connection, which should be so made that the pipe connected with the main will point in the same direction that the water in the main flows, as shown by the plan in Fig. 4. This should be made with a Y-branch, which is far better than a tee. The fall given to sewers by some engineers is but 10 feet in a thousand, but in practice this is too fine, especially if one of the feet in a hundred is all in one joint. A quarter of an inch to the foot is sufficient to carry away everything but rags, bones, bricks and jewelry.

Front wall traps are not used here, nor have we seen one in use for 10 or 12 years. Of course, if, as is usually the case, the wall settles and any kind of a tight joint is made around the soil pipe where it passes through the wall, the pipe will either be broken or thrown out of line. In order to avoid this, if the space around the pipe is made tight with clay of the consistency of tough dough it is the best means we know of for keeping out water and making a tight joint, providing the clay is packed around the pipe on the outside and inside of the wall, but not in the hole in the wall through which the pipe passes, and this should be cut or left large enough so as to give some room for settling. Those who are called upon to do such work in the State of Texas are compelled to pass an examination and show their competency before they are given a license, and I think that this should be required of all who undertake to do such important work, from the sanitary point of view, as plumbing.

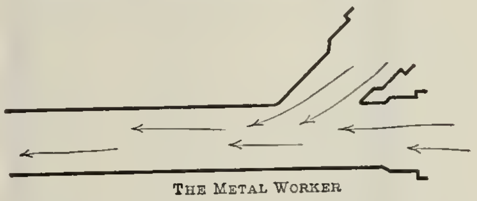

Fig. 4.—Plan Showing How House Sewer Should Connect with Main Sewer.

A plumber of Richmond, Va., writes:

Our city sewers are made of both brick and terra cotta salt glazed pipe. In my own opinion, there is no objection to using salt glazed terra cotta pipe from a point outside of the house wall to the sewer. If the main sewer is made of brick the connection should be made with it above the water level, or just at the arch on the top. If the main sewer be terra cotta pipe connection with it should be made by means of a Y-branch. Here we give all the fall we can to the house sewer, but not less than ¼ inch to the foot.

There is an objection to the use of a front wall trap, as it lets out the odor at the front door of the house at times, and we have abandoned its use in our city altogether. I do not see the necessity for its use, so long as every trap is back vented and the main lines of the soil and vent pipe extend to the top of the roof. If terra cotta pipe is used on the foundation wall a relieving arch should be built over it, and if it comes through above the bottom of the cellar extra heavy cast iron soil pipe should be used, and the opening should be cemented all around the pipe on the outside to make it tight. We never use terra cotta pipe under a house, as it is against the ordinance, which requires that extra heavy soil pipe shall be carried 3 feet outside of the house walls.

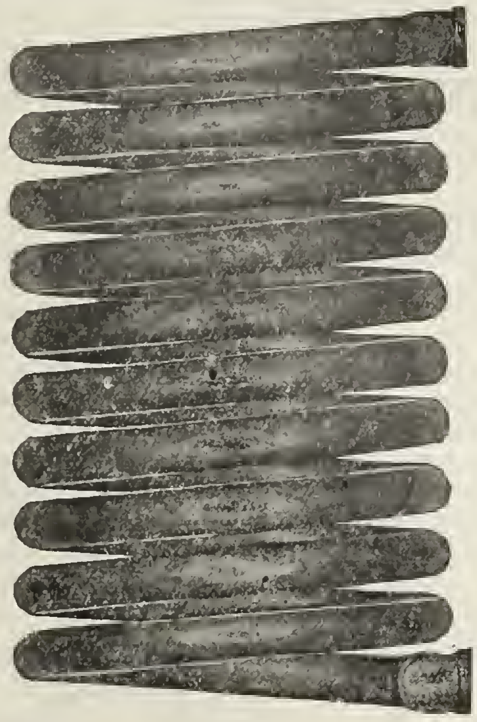
The Calorific Heater & Mfg. Company.

A strip of land on the Lehigh Valley Railroad, at Allentown, Pa., has been purchased by the Calorific Heater & Mfg. Company, who have taken out articles of incorporation for the purpose of manufacturing Calorific steam and hot water heaters, radiators and heating appliances. On this property the company intend to erect a two-story brick building, 50 x 141 feet; a foundry building, 100 x 114 feet, and a one-story frame storage pattern building, 20 x 30 feet, which will be covered with sheet iron. The plant will be equipped with core ovens, six traveling cranes, elevator and scales and a cupola, also drill presses, lathes and other machines for fitting up and finishing boilers and radiators. It is said that the plant will be fully equipped with the best and most modern machinery for turning out the Calorific heaters expeditiously and economically. These heaters, which have been on the market for several years, have not only demonstrated their excellence, but have also secured a wide popularity, so that the company are now enjoying an increased demand for them.

Frank C. Goff & Co., Chicago, Ill., are sending out an announcement that they have sold out their Stove and Hardware business and will in future devote entire time to steam and hot water heating and ventilating, both as engineers and contractors.

The National Pipe Bending Company.

In the accompanying illustrations are shown some styles of pipe coils, which are made by the National Pipe Bending Company of New Haven, Conn. The coil shown in Fig. 1, which is designated by the company as a plain spiral coil, can be furnished in either brass, copper or iron pipe of any size from ⅛ inch to 4 inches in diameter, and in any diameter of coil, the coil being of any length that may be desired. The coil illustrated shows elbow fittings on the ends to pass through the walls of the heating chamber in which it may be arranged. It is suitable for placing in the combustion chamber of a large stove or hot air furnace, to be used for heating water for domestic purposes or for circulation through radiators placed in distant parts of a building. The coil shown in Fig. 2 is adapted for a similar use and arranged so that both the inlet and outlet to the coil pass out through the dome of the stove or furnace.



National Pipe Bending Company.—Fig. 1.—A Plain Spiral Pipe Coil.

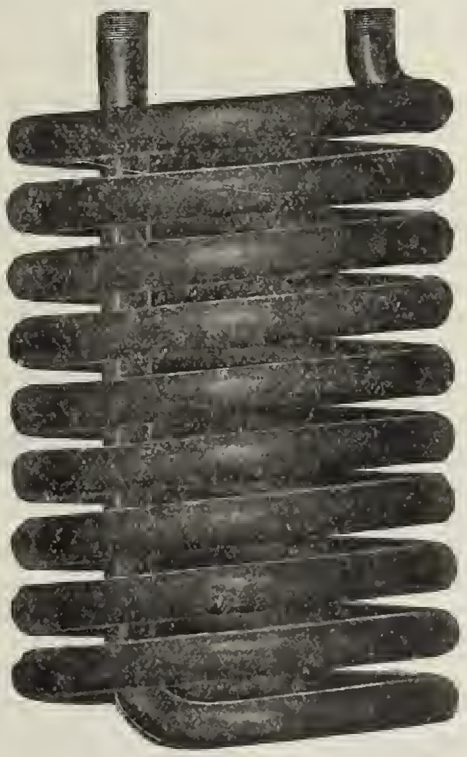


Fig. 2.—A Spiral Pipe Coil.

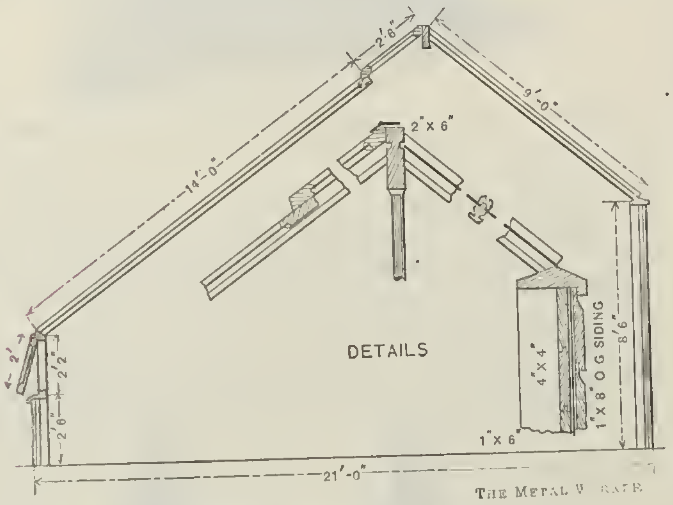
The plant of the National Pipe Bending Company is equipped with electrical welding machinery and bending machinery, so that a continuous coil may be made of as many lineal feet of pipe as may be necessary for special work. The shapes and varieties of the coils into which the company can bend pipe are practically unlimited. They are such as may be used in tanks or vats for boiling the contents, or on the walls of buildings for radiators, or as box coils for indirect radiators. They also make an extensive variety of bends, such as expansion bends for steam pipe, offset bends, wide sweep bends, right angle bends and return bends. The steam fitter or plumber who is confronted with a problem in pipe bending will do well to secure one of their catalogues, in order to become acquainted with the great variety of goods which they can furnish.

HEATING GREENHOUSES TO DIFFERENT TEMPERATURES.

BY MARK DEAN.

Greenhouse construction throughout the country is perhaps more uniform than that of any other class of buildings which require heat. As a matter of fact, their average exposure is over 80 per cent. double strength glass. Furthermore, what wall surface they have is practically the same, being rough boards inside and matched boards outside, with paper between. The detail of the construction is shown in Fig. 1. While the conditions are very much the same in all cases, they are nevertheless hard to overcome, because the loss of heat through the glass is very rapid; there is no dead air space and no stored heat in the walls. Therefore the radiation must be kept continually up to temperature, and there must be surplus boiler capacity to allow for poor firing, poor coal, poor draft or other causes which might allow the temperature to drop sufficiently to stun the plant life, if not seriously damage it. This in either case would mean financial loss to the owner, which means loss of trade to the fitter and a black eye for the boiler manufacturer. At least the owner generally does his part toward giving the boiler a bad name.



Heating Greenhouses to Different Temperatures.—Fig. 1.— Elevation and Section Showing Construction.

On account of these extra requirements, the average boiler, not having special greenhouse ratings, will only carry about one-half to two-thirds the amount of radiation which it is listed to carry in ordinary house heating.

To determine the boiler capacity necessary for any greenhouse, first ascertain the total number of square feet of glass equivalent in the house. This is done by getting the length of sash bars, front, back and in side walls, if any. The combined length of the sash bars, multiplied by the length of the house, gives the total amount of glass exposure in roof and side walls. To this must be added one-third the amount of wall surface. Thus, in the greenhouse 21 x 120 feet represented in Fig. 2 the rear sash bars are 9 feet long, front sash bars 16½ feet long, front side wall sash bars 2 feet long; total, 27½ feet, which, multiplied by the length, 120 feet, equals 3300 square feet of glass in roof and side wall. The front wall below the glass is 2½ feet high; the rear wall is 8½ feet high and has no glass. The total of the two walls equals 11 feet, which divided by 3 to reduce to glass equivalent, equals 3.66. This, multiplied by the length of the house, 120 feet, equals 439 square feet of glass equivalent. One end of the house is exposed, in which there is 132 square feet of glass and 50 square feet of wall surface, equivalent to 16 2-3 square feet of glass, making a total of 3887 2-3, or practically 3890 square feet of glass equivalent.

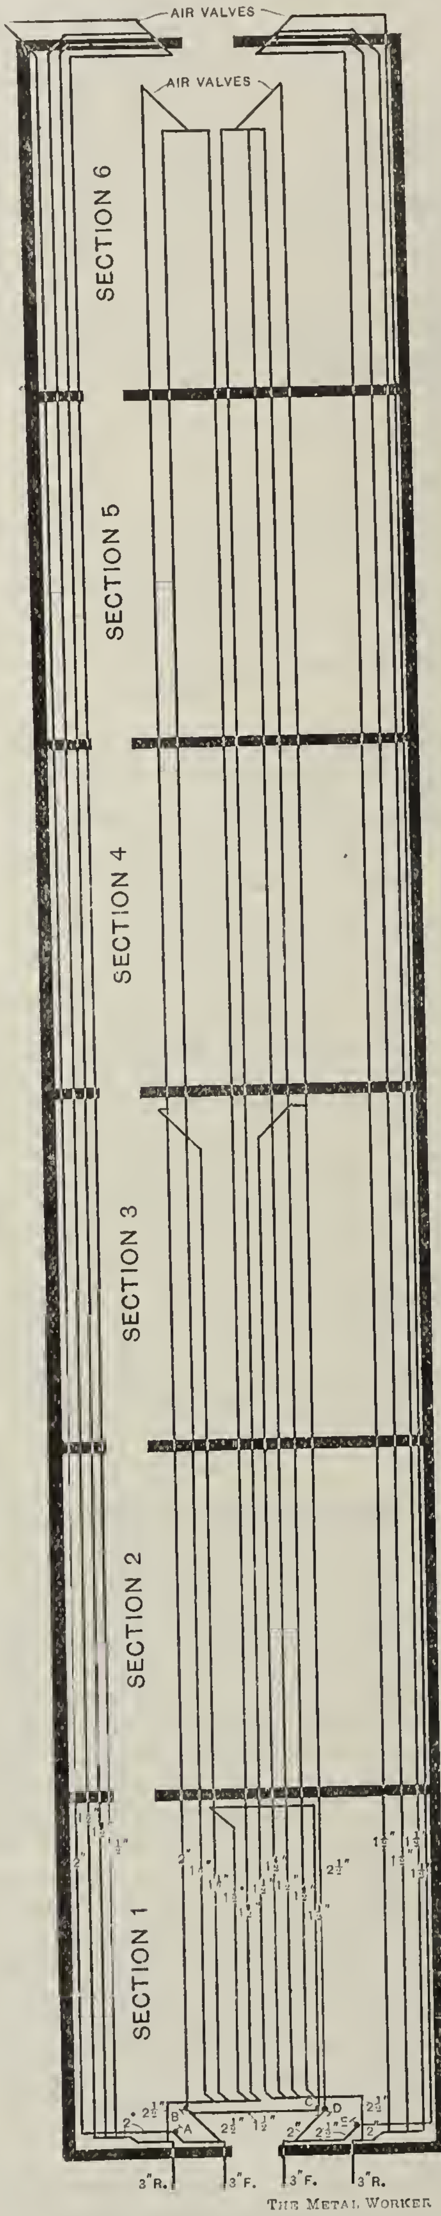


Fig. 2.—Plan of Greenhouse.

To heat by hot water to 70 degrees F. in zero weather 1 square foot of radiation will be required for each

3 square feet of glass or its equivalent. Therefore it will require 1297 square feet of radiation, which the boiler must be able to easily heat to 170 degree F., and maintain that temperature from eight to ten hours.

The particular greenhouse shown in Fig. 2 is divided into six compartments, requiring three different temperatures, for experimental purposes. Section No. 1, shown in Fig. 3, is to be heated to 70 degrees F.; sections Nos. 2 and 3, shown in Fig. 4, to 60 degrees F., and sections 4, 5 and 6, shown in Fig. 5, to 55 degrees F.

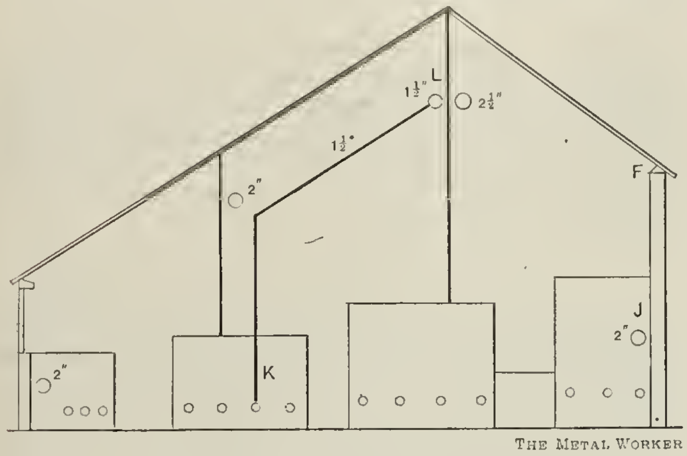

Fig. 3.—Elevation of Section 1.

When figuring on the number of pipes required it is only necessary to consider 1 lineal foot of the house. It has already been noted that the total length of sash bars on roof and front side is 27½ feet, plus the glass equivalent of the walls (1 foot long), which is 3.66, making a total of 31.166 square feet of glass equivalent for each lineal foot of the house.

For house No. 1 divide this by 3, which gives 10.38 square feet of radiation per lineal foot of house. This amount of radiation, 10.35 square feet, is to be divided between the mains and the heating pipes. You already have the total amount of radiation, and the mains must be large enough to carry that; therefore, it becomes a simple matter to determine how many pipes, and of what size, are to be used. However, it is always preferable, for both mains and heating coils, to use as small pipes as possible consistent with the length of the house to be heated; because, by subdividing the mains and using small pipes in coils, there is less water to be warmed and the radiation can be more evenly distributed through the house, and drafts, which are detrimental to plant life, are reduced to a minimum.

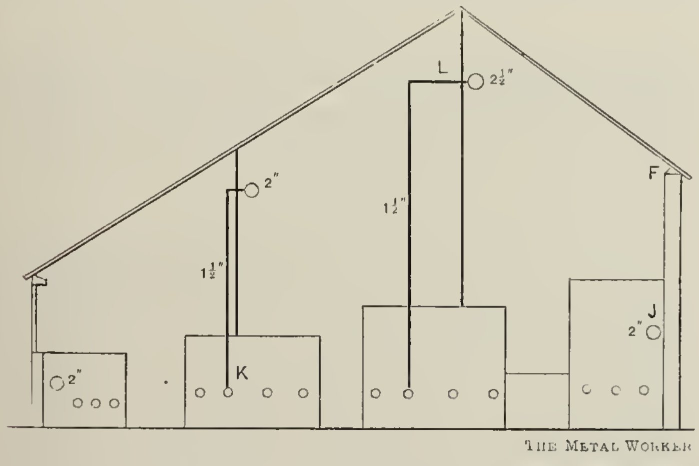

Fig. 4.—Elevation of Sections 2 and 3.

In many catalogues will be found a list giving the square feet of radiation per lineal foot of all sized pipes. As we are figuring on but 1 lineal foot of the house, it is only necessary to consider the amount of radiation per foot of the different sized pipes. First, add together the radiation in 1 foot of the main or mains; subtract this amount from the total required per foot of house, and the result will be the amount of radiation to be used per lineal foot of coils. Divide this number by the amount of radiation in 1 foot of the pipe to be used in the coils, and the result will be the number of pipes. Thus, in section 1 there are:

3 2-inch flow pipes, 0.622 square foot per lineal foot....	1.866
1 2½-inch flow pipe, 0.753 square foot per lineal foot....	0.753
1 1½-inch flow pipe, 0.494 square foot per lineal foot....	0.494
Total..	3.113

Ordinarily, only two decimals are used.

Total amount per foot of house, 10.35 — 3.11 = 7.24, to be divided into coils of 1½-inch pipes; therefore, divide by 0.494 to find how many. 7.24 ÷ 0.494 = 14.65. It is not possible to subdivide a pipe, therefore use 15 1½-inch pipes in coils.

There is the same amount of glass equivalent per lineal foot of house in sections 2 and 3 (31.166 square feet). But a different division is used because only 60 degrees F. is required; therefore, dividing 31.166 by 3½ shows that 8.9 square feet of radiation is required per foot of house. The number of pipes required to make this amount may be found as described above for section 1.

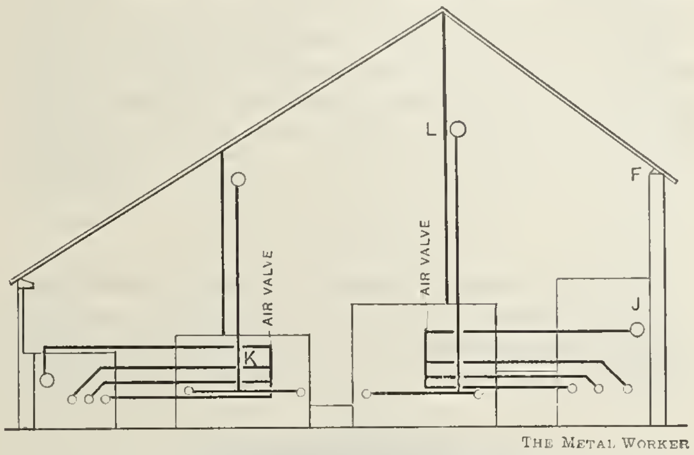

Fig. 5.—Elevation of Sections 4, 5 and 6.

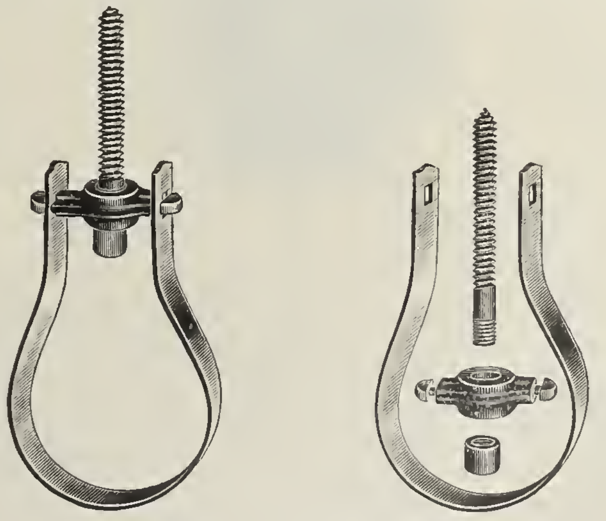
Sections 4, 5 and 6 have the same amount of glass equivalent per foot of house. But here again is another temperature; 55 degrees is required, which will require 3¾ square feet of radiation per foot of glass. Therefore, dividing 31.166 by 3¾ shows that 8.31 square feet of radiation is required per foot of house. In section 6 the conditions are somewhat different on account of the exposed end. To overcome this the side pipes are extended across the end.

The Crawford Pipe Hanger.

A cheap, practical hanger is the claim made by the Crawford Specialty Company, 321 Warren street, Boston, Mass., for the Crawford pipe hanger, shown herewith. It consists of a lag screw and yoke, a nut and a hanger band. In use it is only necessary to adjust the lag screw, put on the cap and yoke, then slip the hanger band over the pipe, and hook the holes in the ends over the ends of the yoke. This character of hanger gives a wide range of length, and can be ultilized in adjusting the grade of the pipes, whether they be the steam or hot water pipes of the heating contractor, or the soil pipes of the plumber. The bands are made of spring steel and the yokes of malleable iron. The hangers are made to fit all sizes of pipe, from 2 to 6 inches. Clamps can be furnished for use with iron beams when desired.



The Crawford Pipe Hanger.

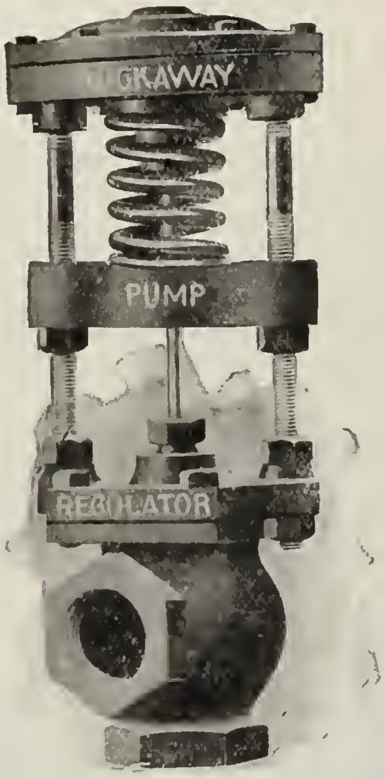
THE NATIONAL COMMITTEE OF THE CONFEDERATED SUPPLY ASSOCIATIONS.

A practically full attendance of the members of the National Committee of the Confederated Supply Associations was secured at the meeting held at Niagara Falls last week, when matters of interest to the manufacturing and jobbing interests in the plumbing trade were discussed. One of the most notable features was the practically unanimous report from all sections that the Chicago Resolutions had received the attention of the members of the Supply Associations throughout the country and that they have the unanimous support of all their members. These resolutions are looked upon as eminently fair to all concerned and are regarded as supporting the principle of trade protection so completely that there is no occasion for further concessions.

We learn that there is a possibility that the summer meetings of the different Supply Associations, instead of being held at different places, may, through changes of dates or such other alterations as may be necessary, be held at some one place. This, however, is still under discussion and as yet nothing has been settled to this end.

The Rockaway Automatic Pump Governor.

In the accompanying illustration is shown one of the many devices manufactured by Kieley & Mueller, 7 to 17 West Thirteenth street, New York City, to assist the heating contractor and engineer in meeting the demands of their customers. The Rockaway pump governor is designed for automatically starting and stopping steam pumps run to maintain a pressure and for controlling them so as to maintain a uniform pressure on the discharge side at all times while being operated. This governor meets the demand for one with a diaphragm and spring, and is guaranteed as a steam tight operating valve, to avoid any possibility of pressure accumulating on the pump to which it is attached sufficient to operate it at all times when a pressure is not desired. It may be used where it is desired to keep up a pressure of steam, water, gas, ammonia, air, or other service systems on which uniform pressure is required, and it may also be used on pumps supplying water to house tanks on the roof, or hydraulic machinery of elevator systems. When the pressure in such a system falls the spring opens the steam valve, so that the steam starts the pump in operation until the pressure is brought up again to the desired point. This valve is made in eight different sizes, adapted for all sizes of pipe from 1 inch to 4 inches.



The Rockaway Automatic Pump Governor.

New York City Notes.

Business is beginning to pick up and many contracts are being given out. It is to be hoped that the increased rate of wages has been considered in estimating for these contracts.

* * *

Matters in Richmond Borough are flourishing, and most of the plumbers there are busy. The association has appointed David S. Melville as business manager, and he is busy looking after matters of interest to the trade, paying especial attention to unlicensed plumbers doing work and those plumbers who are in the habit of loaning their licenses.

* * *

Among the new jobs lately given out in Manhattan is the Lutheran Evangelical Church at Sixty-fifth street and Central Park West, where the plumbing has been secured by T. J. Byrne. J. J. Kuhn has four apartment houses, erected under the new Tenement House law, on 137th street between Seventh and Eighth avenues. B. W. Rod of 306 East Second street has three apartment houses at 144 to 148 East Twenty-second street and four apartments at 136 to 142 Seventeenth street. Charles Stuart has an eight-story apartment on 129th street between Madison and Park avenues. Wm. J. McDermott is plumbing the Brewster carriage factory on Forty-eighth street. E. J. McCabe & Co. of 862 Park avenue are doing the plumbing in the Central Brewing Company's new building on Sixty-eighth street near Avenue A. Lasette & Murphy of 2267 Broadway are doing apartment houses on 112th street west of Amsterdam avenue, and on Seventy-sixth street west of West End avenue.

* * *

The *City Record*, under date of May 6, published the list of master plumbers registered in the Bureau of Buildings in the Borough of Manhattan. Steps should be taken to have a list of all registered plumbers in all the boroughs published.

* * *

The friends of Michael Hughes will be pleased to learn that he has recovered from the injuries received by being thrown from a trolley car some little time ago. He has a fine job to do in seven apartment houses on 137th street west of Seventh avenue.

* * *

I. J. Barth of University place is busy overhauling the building on the corner of Broadway and Eighteenth street. John Tucker is to do the plumbing in the new Progress Club House on the corner of Eighty-eighth street and Central Park West. W. J. Bailey has the plumbing of a new synagogue being erected at 117 to 121 East Eighty-fifth street. Thos. J. Flanagan of 35 Jane street has an apartment house to do at 228 to 230 West Thirteenth street. H. S. Casey of Amsterdam avenue and 123d street is plumbing an apartment house on 137th street east of Eighth avenue.

* * *

One of the largest jobs uptown is being done by J. Rendall of 741 Forest avenue, Bronx, at Bradhurst avenue and 150th street, Manhattan. It is a building nine stories high and 95 x 95 feet in area.

A DEAL is pending for the taking over by the Crane Company of Chicago of the Utah Plumbing Supply Company's business in Salt Lake City, Utah, which has grown to such proportions that a large new building to accommodate the expansion is now in process of erection. It is stated that the consideration to be paid is in excess of $50,000, or at the rate of $115 a share, for the control of stock held by members of the Ellerbeck family. The major portion of the stock is owned by the estate of the late Brigham M. Ellerbeck, who was the founder and executive head of the institution. It is understood that the Crane Company will operate the business in Salt Lake as a branch of the Chicago house.

Heating and Plumbing Notes.

The annual convention of the Connecticut State Association of Master Plumbers will be held in the Masonic Temple at Bridgeport, Conn., on Wednesday, May 14. The call urges that all members attend this meeting, as matters of great importance will be brought before the convention.

The National Pipe Bending Company, New Haven, Conn., inform us that they have just completed an addition to their shop, 100 x 60 feet, which will be used for the manufacture of Iron, Brass and Copper Coils, and also Coil Stoves and Furnaces. These increased facilities will enable them not only to furnish Coils for large work, but to fill orders from plumbers and heating contractors for special Coils needed in their work.

The Kennedy & Sullivan Mfg. Company of Holyoke, Mass., notified their customers that, in view of the demand of the Steam Fitters' Union for increased pay, they would close their steam fitting department on May 1, and that this branch of their business is for sale. In the opinion of the company the demands of the workmen could not be granted and the steam fitting branch of their business maintained with profit.

John Jackson, secretary of the School Board, will receive at Benton avenue, Allegheny, Pa., until May 13, bids for heating and plumbing the North End School Building on Meyran avenue.

Michael Mulvihill, who died Friday, May 2, in his sixty-fifth year, at his home, 1069 Greene avenue, Williamsburg, N. Y., was for 25 years in the employ of the Pennsylvania Railroad and for many years was the superintendent of the company's plumbing department. He was born in Ireland, and at an early age came to America. He is survived by a widow, four sons and four daughters.

The Vanderman Plumbing & Heating Company, Willimantic, Conn., have the contract for plumbing the new factory of the Atlantic Screw Works.

Robert Allison, president of the Board of Public Service of Cincinnati, Ohio, will receive bids until May 19 for heating and plumbing the City Infirmary, at Hartwell, Hamilton County, Ohio.

Jeremiah Foster, chairman of the joint special committee for the erection of a new school house at Ryal Side, Beverley, Mass., will receive bids until May 13 for the heating and plumbing systems.

J. R. Pawling, chairman of the Jefferson County, N. Y., Committee on Buildings, will receive bids until May 14 for heating and ventilating the County Court House, at Watertown, N. Y.

Rouget & Harper bid $5950, and secured the contract for heating and ventilating the Court House, at Rome, N. Y.

The master plumbers of Washington, D. C., have issued a circular recently stating that they are notifying their attorney to institute injunction proceedings against any man or body of men interfering with the conduct of their business, or coercing nonunion men into quitting their employ. It is pointed out that the law is very strong on the point of conspiracy, and the Master Plumbers' Association propose to take full advantage of it. They have made a substantial appropriation to carry these plans into effect.

Stanley G. Flagg & Co., Philadelphia, Pa., have advanced the wages of the 350 employees at their Pottstown, Pa., plant, 10 per cent., making an increase of 32 per cent. in the past 18 months.

Scholl & Semple, Youngstown, Ohio, bid $20,000 and were awarded the contract for the plumbing for the new block of buildings being erected by the Dollar Savings & Trust Company in that city.

Work has been begun on the new power plant for the Eaton, Cole & Burnham Company at South avenue, Bridgeport, Conn. The new building will be 47 x 62 feet in size, and of steel and brick construction. This is the beginning of the increased facilities of the company for manufacturing their extensive line of Valves and Fittings for steam, water and gas.

As evidence of the activity enjoyed by some who are engaged in the manufacture of goods of interest to the heating contractor, we are informed that the Kewanee Boiler Company of Kewanee, Ill., are well occupied at the present time in taking care of orders with which they have been favored.

Steward Brothers are moving their plumbing business into a fine new store in the Merrill Block, on Russell street, Salem, Mass.

Lewis & Kitchen, heating and ventilating engineers, Ninth and Broadway, Kansas City, Mo., have been recently awarded contracts for the introduction of their furnace fan system in the following school buildings: New Ward School, Iola, Kan.; new High School Building, Boise, Idaho, and High School, Chanute, Kan., as well as four ward buildings, Chanute, Kan. They are also equipping two new 12-room schools at Independence, Kan.

The Buckingham-Routh Company, New Haven, Conn., have the contract for heating the new buildings of the Graduates' Club on Elm street, and will install an Ideal Steam Boiler, made by the American Radiator Company.

Hugh McPartland, New London, Conn., is doing the plumbing in a new block of buildings for William Astheimer. The steam heating work will be done by the Hopson & Chapin Mfg. Company of New London.

The town of Gardner, Mass., has recently passed new plumbing regulations, consisting of 25 sections, under which plumbers are required to take out a permit for doing plumbing work.

Phelps Brothers, 284 Pearl street, New York, are distributing an eight-page folder devoted to the interests of the Pennington M. B. M. Steam and Hot Water Heaters. They are prepared to ship promptly the Heaters made with grates 20 inches wide in eight different sizes, rated to carry from 250 to 950 square feet of surface. A Heater which will have a grate 30 inches wide is also well under way. These Boilers are of the vertical sectional type, having a large fire surface. The flues are so arranged as to secure a long fire travel.

R. A. Tarbut has been appointed city plumber of Monett, Mo.

The Urbauer-Atwood Heating Company of St. Louis, Mo., have increased their capital stock from $6000 to $25,000.

The Supervising Architect at Washington, D. C., will receive bids until May 28 for heating the Post Office Building at Fitchburg, Mass.

Freney Brothers of Indianapolis, Ind., bid $6128 and have been awarded the contract for plumbing the Indiana State House.

The Erie Pump Company of Erie, Pa., recently shipped a carload of pumps to the Philippine Islands and another carload to Yucatan.

The Board of Police Commissioners of Baltimore, Md., have received a request from the plumbers that they see to the enforcement of the law in relation to plumbers working without licenses. Patrolmen will be instructed to ask plumbers who are at work on their beats for the proper licenses.

The Richmond Stove Company, Norwich, Conn., having well under way the completion of two large buildings, giving an increased capacity for the construction of the Richmond Boilers, inform us that during the next six weeks they will issue an entirely new Boiler catalogue, showing their line to better advantage than previous issues, and containing information which will be of interest to all who make a specialty of steam and hot water heating.

The Standard Sanitary Mfg. Company of Pittsburgh, Pa., are filling a large contract for Enameled Bathtubs, for shipment to St. Petersburg, Russia.

The Board of Education of Sayre, Pa., will receive bids until May 20 for heating and ventilating a new two-story brick school building in that town.

A new company, to be known as the Pittsburgh Valve & Fittings Company, have purchased a 70-acre site in Barberton, Ohio, and will erect a large plant for the production of Plumbers' Fixtures and Supplies. W. A. Johnson and O. C. Barber of Barberton and M. J. Alexander and others of Pittsburgh are interested in the new company. It is stated that the plant will comprise eight buildings—five 200 x 40 feet, one 250 x 50 feet, one 106 x 50 feet, and one 450 x 60 feet. The site selected has a frontage of nearly 2400 feet on the Erie Railway tracks. F. O. Weary of Akron is preparing plans for the plant.

Orders recently booked by the American Blower Company of Detroit, Mich., include apparatus for installation in the following buildings: Custom House and Post Office, San Francisco, Cal; Queen's University, Kingston, Ont.; Buhl Club House, Sharon, Pa.; Walker School, Flint, Mich.; Pingree School, Detroit, Mich. They have also received an order from the Ohio Leather Company for a heating and drying system for their new plant at Girard, Ohio.

President M. J. Drummond of the Glamorgan Pipe & Foundry Company of Lynchburg, Va., has notified the Pipe foundry employees of an advance of 10 per cent. in their wages. This company are one of the largest producers of Cast Iron Gas and Water Pipe in the country, having large Pipe foundries at Lynchburg, Va., and Radford, Va. Seven hundred men are affected by this advance.

The Curtis & Pierpont Company, New Haven, Conn., are doing the plumbing in the new factory of the Winchester Repeating Arms Company, and are also installing a hot water system in the residence of I. C. Moran.

George W. Couch, Hartford, Conn., is installing Thatcher Combination Hot Air and Hot Water Heaters in the residence of Samuel Clark, and in two other fine houses that are being erected by Nevels Brothers.

Wellington & Miller, Bridgeport, Conn., are installing a Griunell Sprinkler system in the factory of the Bridgeport Brass Company. The firm have taken the agency for the Metropolitan Automatic Injector.

The West Virginia Plumbing & Heating Company of Charleston, W. Va., bid $5475 and secured the contract for heating two large buildings for the Lewisburg Female Institute. They also secured the plumbing contract at $1275.

J. B. Farnsworth & Co., Leominster, Mass., are enlarging their plumbing establishment at 12 Sommer street, by building a two-story addition the entire length of the present building.

Contracts for plumbing new school buildings in Memphis, Tenn., from which the clause in reference to the employment of union labor has been eliminated, have been awarded to Brown & Borum and J. A. Balley & Co. of that city.

The Pond & Hasey Company, 231 Fifth avenue, Minneapolis, Minn, make a specialty of heating with steam, hot water and hot air, particularly in relation to the heating and ventilating of school houses. They have a fine sample room and a large warehouse. The company are the agents for the Magee Heaters, and have recently added five carloads of these Heaters to their stock.

New Firms and Changes.

McCaffrey & McDougall have started a plumbing, roofing, heating and general jobbing shop on Main street, Ridlonville, Maine.

John A. Brooks succeeds the plumbing firm of Moore & Brooks, 347 Bancroft street, Toledo, Ohio.

The Manhattan Sanitary Trap Company of New York City have been incorporated with a capital of $10,000. The directors are: S. C. Alger, E. W. Powers, New York, and P. J. March of Troy, N. Y.

Allen & Reed have been incorporated at Providence, R. I., with a capital of $80,000, by Philip Allen, W. G. Reed and B. J. Horton, to conduct a plumbing business.

McAtee & Lewis are a new plumbing firm at 7 East Front street, South Oil City, Pa. Both members of the firm are experts, having graduated from the shop of the late John Robison. They will do plumbing, gas and steam fitting and carry a line of goods for these purposes so as to fill orders promptly.

The Keystone Valve & Mfg. Company of Pittsburgh have been granted a charter with a capital of $100,000. They have opened temporary offices on Carson street, in the South Side, Pittsburgh, and intend to build a plant in that city for the manufacture of a newly designed steam valve.

The Lebanon Iron & Steel Company, Lebanon, Pa., have been incorporated with a capital stock of $50,000, by Paul H. Dennison, Harry M. Kurtz, William S. Stokes, William H. Tyrol and J. W. White of Philadelphia, to purchase the Lebanon Rolling Mill plant. The company will erect additional mills and manufacture Wrought Iron and Steel Pipe and Tubes.

The C. R. Sargent Company, Kittery, Maine, have been incorporated with a capital stock of $10,000, for the purpose of manufacturing and dealing in Plumbers' Supplies. The officers are O. H. Nelson, Newburyport, Mass., president, and Horace Mitchell, Kittery, Maine, treasurer.

The Martin Anderson Company, with principal office at 13 East Commerce street, Bridgeton, N. J., have been incorporated with a capital stock of $100,000, for the purpose of manufacturing Plumbers' and Tinsmiths' Supplies, &c. The incorporators are Charles C. Woodruff, Charles W. Dare and Edward P. Laning.

A. O. Burtill has opened a plumbing shop at Boothbay, Maine.

New Publication.

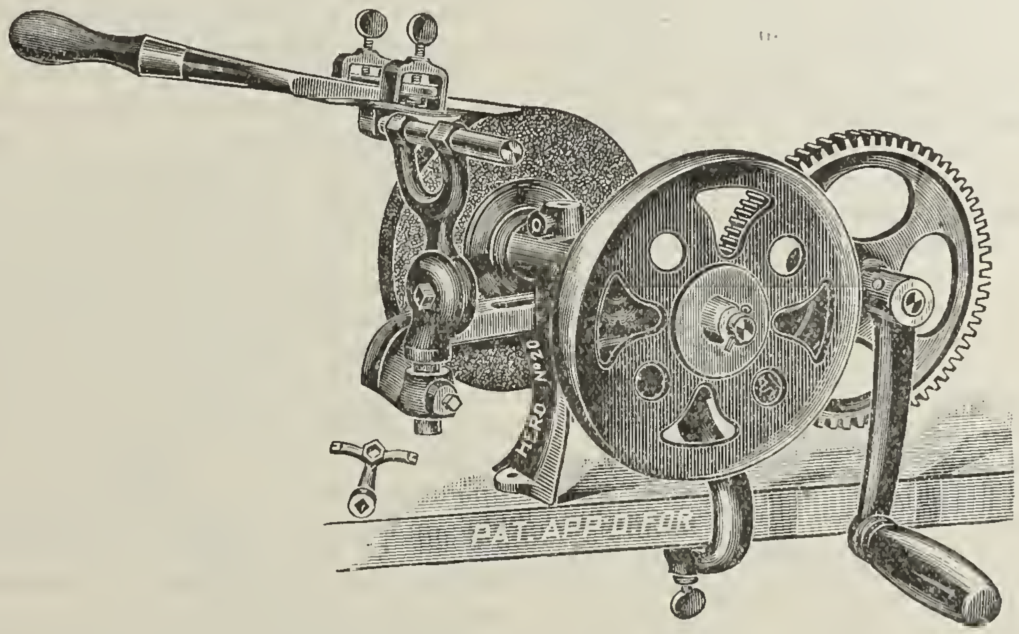
Dean's System of Greenhouse Heating. By Mark Dean. Published by Mark Dean, Boston, Mass. Price, $2. Size, 5½ x 7¾ inches. 46 pages. Illustrated.

This little book will be found valuable for reference on the desk of the heating contractor, whether he makes a specialty of greenhouse heating or general work. The first section is devoted entirely to a method of arriving at the amount of heating surface required for maintaining the different temperatures in greenhouses with either steam or hot water. A useful feature is the tables, by which the radiation for greenhouses of any size and to maintain any temperature may be readily determined. Another valuable time saving table enables the quick calculation of the number of pipes of different sizes that will be required to expose the amount of radiation previously determined. A method of computing the radiation required for greenhouses and conservatories of irregular size and shape is also presented. Another table that will be found of general use gives the radiating surfaces of pipes, so that if a heating contractor has to put a coil in a stove or furnace for heating water for a given amount of radiation, when the amount of surface is determined, by a glance at the table the length of pipe that will be required to expose the surface can be readily found for pipes of any size, from ¾ to 12 inches in diameter. This table will also be found useful in determining the amount of pipe required in box and wall coils, also for coils to be placed in tanks or vats for heating the contents. Table are also presented giving the circumference and area of circles, the size of supply and return pipes for steam and hot water systems for various amounts of radiation, and other details of interest to the heating contractor.

Not the least interesting and important portion of the book are the four pages devoted to guide posts in which attention is called to many little features, such as chimney draft, reaming of pipes, twin connection of boilers and many other things that are equally important, whether in a greenhouse heating system or a plant in a building of any other kind. A standard price-list of wrought iron pipe and cast iron fittings for wrought iron pipe is also given, and on one page is shown the rated capacity of boilers for hot water and low pressure steam heating. To those who are called upon to heat greenhouses, whether beginners or experienced men, the book will be found of special convenience, owing to the facility with which the information on sizes may be secured without laborious calculations. The book will be equally valuable to heating contractors doing a general line of work.

Hero Bench Emery Grinder.

Robertson Mfg. Company, 38 Greenwood place, Buffalo, N. Y., have just put out the Hero bench emery grinder No. 20, here shown. It has some of the features of their No. 10 Hero emery grinder, which has already been illustrated in these columns, the No. 10 being a column machine instead of for bench installation. The illustration herewith shows their universal tool carriage and clamp, by the use of which a tool can be ground accurately square or any angle or bevel. By this method it is also claimed that it is much less work to finish sharpening on an oil stone, as the ground surface of the tool will be slightly concaved, thus allowing the fine edge to come in contact with the oil stone without working the whole surface down on the stone to get a fine edge. Each machine has one best make emery wheel, 6 x ¾ inches, and an extra holder for skate and cutlery grinding. By reversing the tool rest it is in position for grinding cold chisels, drills, machine parts, &c. The machine can be carried in the tool chest furnished with a special clamp with screw holes in frame to fasten to the bench with the necessary wrenches to fit nuts, &c. A foot power connection is also made, and can be applied at any time. The shaft is of steel, ⅝ inch in diameter, the bearing in the head being milled from the solid to a fine bearing. The machine is geared 19 to 1, and has a special mechanism arranged in the intermediate gear which allows the workman to cease turning the crank at any time while the wheel will still continue to run. The machine is compact and complete weighs 14 pounds.



Hero Bench Emery Grinder No. 20.

The Industries of Pennsylvania.

According to a report of the Census Bureau over $1,500,000,000 is invested in manufactures and mechanical industries in Pennsylvania. The report shows that in 1900 there were 52,185 manufacturing establishments in the State, with an aggregate capital of $1,551,548,712. This sum represents the value of land, buildings, machinery, tools and implements and the live capital utilized, but does not include the capital stock of any of the manufacturing corporations of the State. The value of the products is returned at $1,834,790,860.

There has been a large growth in the manufacturing and mechanical industries of Pennsylvania during the half century. The population during these years increased from 2,311,786 to 6,302,034, while the average number of wage earners employed in manufacturing establishments increased from 146,766 to 733,834.

In 1840 and in 1850 Pennsylvania ranked third in the United States in manufacturing and mechanical industries, but at all succeeding censuses its rank has been second. In the amount of power used in manufacturing —an index of the factory system proper—Pennsylvania has ranked first since 1870, using in that year 15.5 per cent. of the total power used in the United States and 16.4 per cent. in 1900.

The report says that few States have been so favored as Pennsylvania in natural resources. The raw materials for many kinds of manufactures are abundant, the State ranking high in the production of lumber, cereals, crude petroleum and iron ore. It not only has fuel sufficient for its extensive manufactures, but ships an immense surplus each year to other States.

The annual coal production of Pennsylvania between the years 1880 and 1890 was each year more than one-half of the total for the United States. Natural gas has been used in the State for manufacturing purposes since 1874. This fuel has been used in the manufacture of glass, the puddling of iron, the heating of large furnaces in the manufacture of steel, and the roasting of ores.

The manufacture of iron and steel is the most important industry in the State. The 291 establishments reported in 1900 gave employment to 110,864 wage earners, and the products were valued at $434,445,200. In 1880 the value of its iron and steel products amounted to 49.1 per cent. of the total for the United States and in 1900 to 54 per cent.

Water the Future Motive Power.

In a newspaper interview with Lord Kelvin the other day the great British scientist is credited with the following prediction as to the future of Niagara Falls:

I regard Niagara Falls as the greatest problem in America for scientists to solve. The time is coming when coal and oil will be too scarce and too expensive to be used for the manufacture of power. There is at Niagara Falls an inexhaustible supply of power that in 50 or 100 years is bound to be utilized to its fullest extent. I predict the time will come when the water will no longer flow over the great Horseshoe Falls, but the same water will find its way down the river through countless turbines, spreading light and power for the use of millions of people in all sections of the country. This world must depend on its water for power in the future. The supply of coal will soon become so exhausted that it cannot be profitably used for manufacturing purposes. America has millions upon millions of horse power in connection with her rivers that are utterly neglected. This power is bound to be developed in the near future. The start that has been made at Niagara Falls is only the beginning of a new era in the manufacture and transmission of power.

◆

The wire workers in 22 Brooklyn factories went on strike on Monday owing to the refusal of the employers to grant their demand for a working day of eight hours in place of the ten-hour day now customary, with the same wages.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

HEATING AND VENTILATING QUESTIONS.

From C. K., New York City.—Will you kindly help out an old reader of *The Metal Worker* on some problems which confront him for which he has no data or formula to figure out? The building in question is heated by a low pressure steam system, using direct and direct-indirect radiators. The rooms shown in the sketches are heated by means of direct-indirect radiators. The flue for ventilation, shown in Fig. 1, starts from the second floor and runs up to the roof, discharging the air that passes through it to the outer atmosphere. A portion of the second floor, shown in Fig. 2, which is used as a church room, or auditorium, has a capacity of 51,800 cubic feet. The room on the third floor, shown in Fig. 3, is used for a sick room, or hospital, and has a capacity of 31,700 cubic feet. The room on the fourth floor, shown in Fig. 4, is used for a dining room and has a capacity of 8640 cubic feet. The ventilating shaft is 18 inches deep, 8 feet wide and 61 feet high. I desire to know what sized radiators to use in the different rooms, as we wish to put two in the room on the second floor, two in the room on the third floor and one in the room on the fourth floor. Also let me know how many feet of surface should be exposed in the radiators or coils (if coils would answer for the third floor) to move the air in the room properly. I should also like to know where to put the registers—at the top or the bottom of the room? I should be glad to learn some way to make the calculations for such cases.

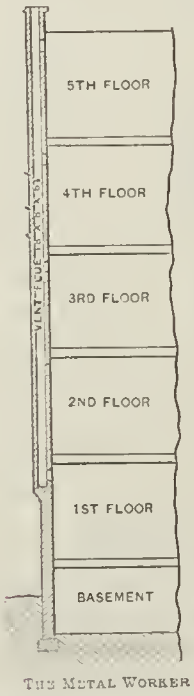

Fig. 1.—The Ventilating Flue.

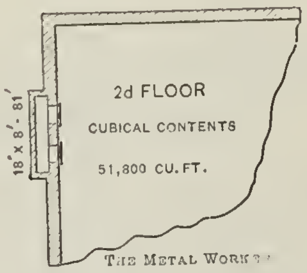

Fig. 2.—Portion of Second Floor.

Heating and Ventilating Questions.

Answer.—The number of occupants not being stated, it may be assumed that a change of air four times an hour will be satisfactory. At any rate, the volume corresponding to this air change will probably exceed that admitted through the direct-indirect radiators. A 15-minute air change in the second-floor room of 51,800 cubic feet corresponds to 3453 cubic feet per minute, in the third-floor room of 31-700 cubic feet corresponds to 2113 cubic feet per minute, and in the fourth-floor room of 8640 cubic feet to 576 cubic feet per minute. Assume a velocity of 300 feet per minute through the vent registers. This gives the net area for second floor, 3453 ÷ 300 = 11.51 square feet; for third floor, 2113 ÷ 300 = 7.04 square feet; for fourth floor 576 ÷ 300 = 1.92 square feet.

Two registers are to be used on the second floor, equal to about 5.76 square feet net area each. Use two 30 x 36 inch vent registers, the net area of each being 864 square inches. On the third floor the two registers will each be 3.52 square feet in area. Use two 24 x 30 inch registers, having a net area of 480 square inches each. On the fourth floor use an 18 x 24 inch register having a net area of 288 square inches.

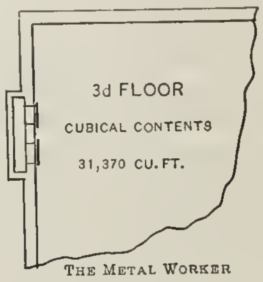

Fig. 3.—Third Floor.

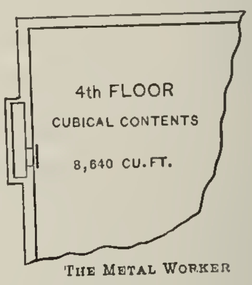

Fig. 4.—Fourth Floor.

If the aspirating coils are placed on the third floor the hight of the heated flue will be reduced to, say, 50 feet. The flue is 18 inches by 8 feet, or 12 square feet area. The volume of air to be moved is 3453 + 2113 + 576 = 6142 cubic feet per minute; 6142 ÷ 12 = 512 feet velocity. This is a pretty high velocity in a flue of the hight stated, with natural draft—*i. e.*, without a fan.

To secure this velocity the excess of temperature in the flue over that of outdoors must be about 40 degrees. This will occur naturally up to freezing outside. Above that the flue must be heated.

With natural or gravity systems it is hardly expected to maintain the same outflow of air in mild weather as in cold, as that would necessitate very large flues and aspirating coils. An excess of 20 degrees would give a velocity of about 350 feet, corresponding to an air change once in 20 odd minutes. To heat the air even this amount, when the outside air approaches 70 degrees, would require a very large coil.

In school house work it is common practice to use about 20 square feet of coil to handle 1500 cubic feet of air per minute. On this basis an 80 square foot coil would be necessary to handle 6142 cubic feet per minute. The coil could be figured out on a heat unit basis, but it is hardly necessary to go into that here.

Of course the nearer the base of the flue above the vent openings the coils are placed the more effective will they be. Aspirating coils placed, as they not uncommonly are, near the top of the flue are of relatively slight effect. The registers should be placed near the floor, otherwise the warm, fresh air admitted through the radiator would not be drawn down to the breathing line from the ceiling, where it first goes on entering the room.

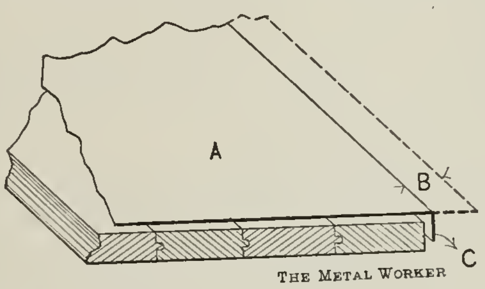
CAN RUSTY CANS BE SOLDERED?

From T. H., Albany, N. Y.—In regard to the inquiry of "M. J. S. & Co.," Houston, Texas, in reference to soldering rusty cans, I would say clean off the parts as well as can readily be done, with sandpaper preferably. After this take a swab and with diluted sulphuric acid rub the parts, or leave it on until clean. The rubbing will be the quickest way. Wash the can with clean water, after which it can be easily soldered with cut muriatic acid, prepared in the usual way, by the addition of as much zinc to the acid as it will dissolve.

From A. C., Savannah, Ga.—Having seen the inquiry of "M. J. S. & Co." in *The Metal Worker* of May 3, I would say that perseverance and elbow grease can be used to best accomplish the result he desires. Solder does not readily adhere to rusty iron, consequently the rust must be removed. For this purpose old files may be heated, forged and bent to various shapes that will be most convenient and then sharpened, when they will make effective scrapers to scratch off the rust and scrape the iron bright. It must then be soldered with cut acid and a hot soldering copper. Whoever undertakes this job will find more work than pleasure in it, and, in consequence, must not expect to accomplish too much in a given time. I point this out for the benefit of the man who looks after the financial end. He must add a substantial percentage to what he might consider a fair price for such work, to make up for the loss of time that will result with the most conscientious workman when engaged on such a disagreeable task.

BEADING GUTTERS.

From C. A. S., Mankato, Minn.—Some time ago I purchased one of your books on "Roofing, Cornice and Skylight Work," in which is explained all about making gutters, &c., on a brake. A bead appears in the illustration, but, as there is no beader shown, will you kindly explain how this bead is made; also how I could make a beader 8 feet long with ½, ⅞ and 1 inch rods?



Beading Gutters.—Fig. 1.—Bending the Sheet.

Answer.—We would advise our correspondent to purchase a beading machine for making the different sized beads 8 feet in length. The prices of these tools are very reasonable, and we doubt if one can be constructed by him which would turn out true, straight beads. However, in many shops no beader is employed, but the beads are made by hand, a method so common that no mention was made of it in the "Roofing, Cornice and Skylight Manual." In the accompanying illustrations are shown the four operations employed for beading gutters:

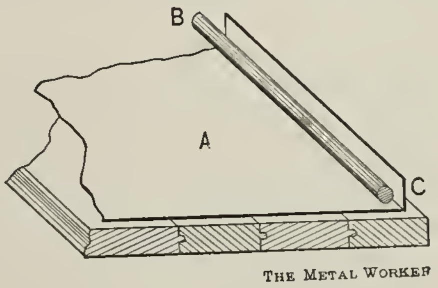


Fig. 2.—The Position on the Bench.

In Fig. 1, A shows the sheet of metal on the bench projecting over the edge of the bench as far as B (the amount of material required to incase the bead). It is then turned down with the mallet, as indicated at C. This first operation could be avoided by making a bend in the brake as shown at C. The second operation is indicated in Fig. 2, where the sheet A is laid upon the bench with the edge C turning upward. Now take the required size rod or gas pipe, place it as shown at B, and using the mallet turn the metal C over the rod, when it will look as shown at A in Fig 3. Then, holding the sheet in the position there shown, turn the metal tightly around the rod B, as shown in diagram C, using the sharp edge of the hammer D, being careful not to make any dents on the sheet A. When this operation is completed the rod is tightly incased.

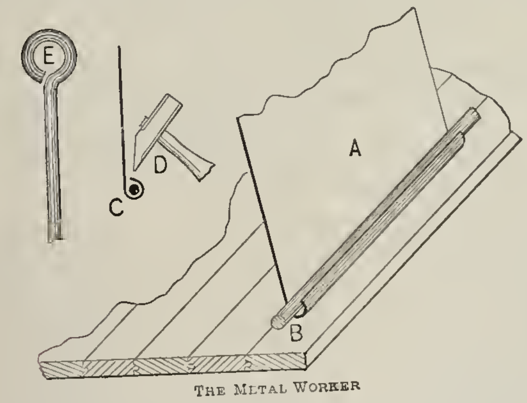

Fig. 3.—Bending the Sheet.

To remove the rod so that the other sheets can be beaded, lay the sheet A flat upon the bench and tap lightly along the bead with the mallet, when the rod can easily be drawn out. In shop use the rods have a ring at one end, as at E, from which they hang against the wall. This is also used to draw the rod out of the sheet after it is beaded.

JOB BELONGS TO SHEET METAL WORKERS.

From F. T. P., Dallas, Texas.—There is quite a discussion in our city between the carpenters, tinsmiths, contracting carpenters and contracting sheet metal working concerns as to which trade belongs the work of putting up stamped steel ceilings, stamped imitation brick and rock face siding, underpinning, corrugated and V-crimped iron, &c. The carpenters claim that it is customary all over the country for them to put this material in place, and that it belongs to their trade, while the sheet metal workers claim that it does not belong to the carpenters' trade, but to the sheet metal workers' trade. We shall be glad if *The Metal Worker* will give its views as to whom this class of work belongs, and also hope the trade in different sections will express their views on the subject, for we would like to have this matter settled between the different trades unions.

Note.—We hope that our readers will freely express their views on this subject. There can be no doubt that so far as the fitting of the sheet metal is concerned, the tinsmiths are far better qualified to do the work than the carpenter, and it is naturally a branch of their work. Unfortunately, the tinsmiths have not given the amount of attention to the introduction and use of the materials mentioned that would have prevented the present question from arising. The result is that in many sections contracting carpenters buy and put in place much of these materials. We are inclined to think, however, that this is a special branch, and it has been so treated by some architects and builders. It has been taken up in some cities by men who make a specialty of store decorations and furnishings. This is particularly noticeable in parts of New England. In the larger cities the outside work is naturally done by journeymen tinsmiths and sheet metal workers, and we think that throughout the country they handle by far the greater proportion of this class of material. So far as the inside work is concerned specialists now do a good share, if not the larger proportion, of the interior decoration of buildings with ceiling and side wall patterns in stamped steel. Carpenters and handy men doubtless do some of it, and the sheet metal worker a fair proportion. The popularity of this character of interior decoration is evidence that the period of introduction has passed, and if the sheet metal workers expect to derive benefit from the sale of the material and putting it in place, it will be necessary for them to take hold of this branch of the trade with energetic enterprise.

ADDRESS WANTED.

If "A. T.," who sends us an inquiry about the strength of galvanized iron, will furnish us with his full name and address, as requested at the head of this department, we shall be pleased to call attention to his request.

◆

A consolidation of the Star Aluminum Company of Doylestown, Ohio, and the Bay State Aluminum Company of Massachusetts has been effected by W. C. Spencer of Akron, vice-president of the Star Company. It is stated that the Bay State plant will be removed to Doylestown and the line of products of the two concerns will be enlarged. Heretofore the Doylestown concern have manufactured Combs and the Bay State Company Cooking Utensils.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is strong and about ½c. higher in price, but quiet.

Copper is quiet but somewhat firmer.

Pig Lead is dull but firm.

Spelter is easy and quiet.

Antimony is unchanged.

Nickel is active and without change.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged and firm.

Black Sheets continue in heavy demand, with prices strong.

Galvanized Sheets are not in quite such heavy demand, but are still active and firm.

Old Metals are quiet and weaker, especially Scrap Brass and Copper.

Foundry Iron is still very scarce, with prices high and little doing for lack of supply.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume and prices remain strong.

Solder is up ½c. a lb.

Screen Doors are in heavy demand, with prices higher in some quarters.

Wire Nails are very active and market is firm.

Cut Nail base prices were reaffirmed for May, some advances being made on smaller sizes.

Roofers' and Slaters' Nails are slightly higher in price.

Window Glass is quiet at recent advance.

White Lead is in good demand at unchanged prices.

Linseed Oil rules quiet and firm.

Spirits Turpentine is dull and unchanged.

Galvanized Range Boilers have been advanced in price from 5 to 10 per cent.

Cast Iron Soil Pipe prices have been reaffirmed.

Plumbers' Brass Goods are 10 per cent. higher.

METAL MARKET.

New York, May 9, 1902.

Pig Tin.—The market has advanced further during the week and prices now stand at the highest point touched since July of last year. Business in the meantime is not heavy, as large consumers are still supplied through old contracts, which were taken when prices were 5c. or 6c. lower than at present. It was the large purchases made a number of weeks ago that occasioned the heavy deliveries during the month of April, which were the largest on record, amounting to 3300 tons. Jobbers' prices are about ½c. higher than a week ago, Straits Pig in small lots being quoted at 30c. to 30½c. per lb. Stocks both here and in London are thoroughly under the control of strong holders, who, it is believed, can easily maintain the high level of prices for some time to come.

Copper.—While the consumptive demand for Copper is still very light, a firmer feeling has been developed in the market, and transactions of several hundred tons are said to have been carried through during the week at higher figures. The market closed steady, Lake Ingots in small lots being quoted at about 13c. to 13½c. per lb. and Casting Copper at 12¾c. per lb.

Sheet Copper.—A continued active demand for Sheet Copper is reported. While consumers are buying mainly for the supply of current needs, the volume of orders reaches a very substantial aggregate and the outlook in this branch of trade is regarded as favorable for an exceptionally large business during the present year. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—This metal is without change. The market continues dull and uninteresting, with prices firm at the figures ruling for some time past. American Pig in small lots is quoted at 4.45c. to 4½c. per lb.

Spelter.—The tone of the Spelter market is somewhat easier, but retail quotations are unchanged, good Western brands in small lots ruling at 4.65c. to 4.75c. per pound. Trade is of a light order and the market as a whole quiet and without special points of interest.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions. Prices are unchanged at 6¾c. per lb. for 600-lb. cask lots and 7c. to 7¼c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market is absolutely devoid of any feature of interest. While deliveries on former contracts are being made in large volume and are being taken up promptly, but little new business of any size is reported, either for prompt or forward delivery. Orders from the smaller consumers, however, show an increase, caused probably by the setting in of settled weather, which permits the carrying on of outdoor operations. Prices are without change. American Bessemer Coke Plates, IC, 14 x 20, are quoted at $4.85 to $4.95 per box for moderate sized lots delivered at New York or corresponding points.

Sheets.—The market for Sheets continues very strong, and the demand is heavy, especially for Black Sheets. Galvanized Sheets, while active, are not being called for in quite as large a volume as in the past few weeks. Manufacturers are so well filled with orders that they would welcome the opportunity of a lull in the demand to enable them to come abreast of their contracts, and, if possible, to accumulate a little stock, which is sure to be wanted during the summer months. Jobbers' prices remain without change. No. 27 One Pass Cold Rolled Soft Steel Sheets rule at about 3.85c. to 3.90c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: There have been a few important sales of Sheets, several thousand tons having been sold for delivery during the last half of the year, but the aggregate volume of business has been less, there being less pressure from buyers, but the tone of the market has continued firm. Small lots of No. 27 Black Sheets from store, Chicago, are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store ruling at 4.70c. to 4.75c. for No. 27.

Old Metals.—The demand for Scrap is light, and, as stocks are accumulating, prices are inclined to sag. Old Brass and Copper are weak. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	9¾c.
Light and Tinned Copper	per lb.	8¾c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6¼c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2⅞c.
Pure Aluminum Sheet	per lb.	25 c.
Cast Aluminum	per lb.	20 c.
No. 1 Pewter	per lb.	16 c.
No. 2 Pewter	per lb.	8½c.
Tin Plate Scrap, per gross ton		.... to $5.00
Wrought Iron Scrap, per gross ton		$13.00 to 13.50
Heavy Cast Scrap, per gross ton		12.00 to 12.50
Stove Plate Scrap, per gross ton		8.50 to 9.00
Burnt Iron, per gross ton		7.00 to 7.25

The C. E. Sears Canning Company of Circleville, Ohio, are putting up an addition and installing new machinery which will increase their daily output to 60,000 tin cans. An electric light plant will also be installed.

THE PIG IRON MARKET.

New York.—A feature of the market is that quite a number of founders, particularly in New England, find that their consumption is larger than expected, and are being forced to cover their additional requirements at the market price. We quote, for summer delivery, Northern Iron, at tidewater, No. 1 X, nominal, $21.50 to $22; No. 2 X, $19.50 to $20; No. 2 Plain, $19 to $19.50; Tennessee and Alabama brands are as follows: No. 1 Foundry, $19.50 to $20.50; No. 2 Foundry, $18.75 to $19.25; No. 3 Foundry, $17.75 to $18.25.

Chicago.—The market has been rather wild, prices advancing sharply from 50c. to $1.50 per ton, in a few instances there being a variation of from $1 to $2 per ton in the various grades of both Southern and Northern Iron. Prices have been governed by the urgency of the buyer or the temerity of the seller to demand. The volume of business has been relatively light, as spot Iron is scarce and very few furnaces are in a position to take further orders, even for future delivery. Reports are current that a number of foundries have preferred to shut down rather than pay the present prices. This seems to be rather the exception than the rule, however. Not a few buyers who have orders for Castings on their books suddenly find themselves forced into the market because of the failure of furnaces to make deliveries contracted for. These urgent buyers have been forced to pay the high prices now prevailing. We quote as follows:

Lake Superior Charcoal	$22.50 to $23.25
Local Coke Foundry, No. 1	21.00 to 22.00
Local Coke Foundry, No. 2	20.00 to 21.00
Local Coke Foundry, No. 3	19.50 to 20.50
Local Scotch, No. 1	20.00 to 22.00
Ohio Strong Softeners, No. 1	23.10 to 23.35
Southern Silvery, according to Silicon	20.40 to 20.90
Southern Coke, No. 1	19.65 to 20.65
Southern Coke, No. 2	19.15 to 20.15
Southern Coke, No. 3	18.65 to 19.15
Southern Coke, No. 1 Soft	19.90 to 20.65
Southern Coke, No. 2 Soft	19.15 to 19.90

Philadelphia.—Opinions are a little divided in regard to the exact status of the market. Furnaces appear to be doing better than for some months past, and deliveries on old contracts have been a trifle better. New business, however, is hard to place, unless by paying extremely full figures. The market may be said at the present time to be taking a breathing spell. There is nothing to indicate weakness, but there is evidently a desire to take new soundings before making further commitments. Sales during the week have been on a basis of $19.75 to $20.50 for No. 2 X Foundry. For strictly May and June deliveries 50c. to 75c. more would have to be paid, but the range is about as follows for Philadelphia and nearby deliveries, covering the last four months of the year:

No. 1 X Foundry	$20.50 to $21.50
No. 2 X Foundry	19.75 to 20.50
No. 2. Plain	19.25 to 19.75

Pittsburgh.—Prices of Pig Iron are steadily going up, and the scarcity of metal is getting worse. Furnaces disclaim the responsibility for the high prices, insisting that it is the buyers who are putting the market up. No. 2 Foundry Iron is sold at $21 at Valley furnaces. We quote Bessemer at $20 to $21, at furnace, but it is doubtful whether any Iron could be had at the lower figure. The current rate for No. 2 Foundry, f.o.b. Pittsburgh, is $21.25 to $21.75.

Cincinnati.—The general situation in Pig Iron, especially Southern Iron, seems to be absolutely unchanged from what it was a week ago. The amount of Iron selling in this territory at present is very small, and there is quite an anxious inquiry for all sorts of Foundry Iron for immediate delivery. Immediate delivery Iron, however, is not to be had. As to the value of Southern Iron, quotations can only be arrived at from the small amounts that are being sold, and these are going on the basis of $15 to $15.75, Birmingham, for No. 2 Foundry. Under the circumstances the situation is strong, with the outlook favoring an increase in prices rather than a decline. We quote f.o.b. Cincinnati, as follows:

Southern Coke, No. 1	$18.25 to $19.00
Southern Coke, No. 2	17.75 to 18.50
Southern Coke, No. 3	17.25 to 18.00
Southern Coke, No. 4	16.75 to 17.50
Southern Coke, No. 1 Soft	18.25 to 19.00
Southern Coke, No. 2 Soft	17.75 to 18.00
Southern Coke, Gray Forge	16.75 to 17.50
Southern Coke, Mottled	16.75 to 17.50
Ohio Silvery, No. 1	21.35 to 21.85
Ohio Silvery, No. 2	20.85 to 21.35
Lake Superior Coke, No. 1	21.85 to 22.35
Lake Superior Coke, No. 2	20.85 to 21.35
Lake Superior Coke, No. 3	19.85 to 20.35

CHICAGO REPORT.

Scrap Iron and Steel.—The market has improved in tone, there being an increased demand for consumption by larger melters of Iron, but offerings from the country continue ample, and with the exception of Cast Borings, which are again higher, dealers make no change in quotations. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipe and Boiler Tubes	12.00 to 12.50
Cast Borings	8.50 to 9.00
Turnings	11.50 to 12.00
Horseshoes	14.00 to 14.50

Old Metals.—Further weakness has been developed in the market for both Copper and Brass, and lower prices have ruled for Copper Wire, Copper Bottoms and Red Brass Borings. Other articles remain steady as previously quoted:

	Per lb.
Copper Wire and Heavy	10½c.
Copper Bottoms	9⅝c.
Copper Clips	10½c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	9¾c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	21 c.
Pewter, No. 1	17½c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—There is a fair movement and a steady market with fair offerings of all kinds of Old Rubber. Prices remain without essential change:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	6.85c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8¼c.

Rags.—Offerings have continued liberal. but with a fair demand the market has remained steady. Rags, Chicago delivery. 70c. to 75c. per 100 lbs. in any quantity.

Anthracite Coal.—There is an active demand and a firm tone prevails. The following schedule of prices is in force for all shipments in the month of May subject to a discount of 40c.; on June 1 another advance of 10c. per ton will be in force by the reduction of the discount to 30c.:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

Work on the new plant which the Pittsburgh Reduction Company are erecting near East St. Louis, Ill., is well under way. The buildings will cover 6 acres, and will be similar to those of the company at New Kensington, Pa. It is understood that as soon as the buildings have been completed eight calcining furnaces, now at New Kensington, will be removed to the new works.

The Kuenzel Non-Asphyxiating Non-Explosive Crude Oil Gas Producing & Heating Company, with principal office at 260 Eleventh street, Hoboken, N. J., have been incorporated with a capital of $2,000,000. The incorporators are G. W. Draesel, M.D., Isaac Ingleson, Wm. Graafmeyer, John Schmidt, Herman W. Schmidt, Aug. Melching, Henry E. Graafmeyer, Henry Mehte, Chas. and A. Kuenzel, Jr.

THE HARDWARE TRADE.

The difficulty in obtaining goods, especially season goods, is a marked feature of the trade at the present time. An unusual number of lines are in scant supply. This condition characterizes not only spring and summer goods, but many other lines such as Builders' Hardware and many kinds of heavy Hardware which feel immediately the effect of the difficulty in obtaining raw material. While in certain ways the trade is not so active as it was, this is regarded as owing principally to the fact that stock orders were placed some time ago, and with the liberality which characterized the buying were of sufficient size to cover the season's requirements. The jobbers unanimously report a large volume of business. Prices are steady and have something of an upward tendency. The changes, however, the past week have been few. Of most general interest is a change in the Cut Nail card, which, though not involving an important advance, will entail some labor on merchants who have become accustomed to the old one. The amount of building throughout the country is large, and all the indications point to a very satisfactory trade in this line so far as volume is concerned. The close prices at which it is done and the lack of harmony between the manufacturers, jobbers and retailers in the marketing of this line tend to make the business annoying and unsatisfactory. Export trade is rather quiet for several reasons, a marked factor being the great home demand and resultant higher prices.

◆

NOTES ON PRICES.

Galvanized Range Boilers.—The manufacturers of Galvanized Kitchen Range Boilers held a meeting in New York City on May 1 and advanced prices on the entire line, ranging from 5 to 10 per cent., according to the manner in which the raw product has been affected by the recent changes in the Iron market. It was said after the meeting that another advance of a substantial kind would take place at a meeting to be held in July. The business of the association was never in better shape. The demand for their products is much greater this season than it has ever been before, and there is no likelihood of any drop in prices from this time to the end of the year. Following are the new discounts:

30-gallon Standard Boilers	72½ %
35 and 40 gallon Standard Boilers	70 %
Other sizes up to and including 52 gallons	65 %
Other sizes above 52 gallons up to and including 192 gallons	55 and 5 %
Extra Heavy Boilers, up to and including 52 gallons	60 and 5 %
Sizes above 52 gallons	50 and 5 %
Expansion Tanks	55 and 5 %
Brazier Tanks	55 and 5 %

Air Tanks, same as Standard Boilers.
Horizontal Tanks, same as Standard Boilers.

Cast Iron Soil Pipe.—A meeting of the manufacturers of Cast Iron Soil Pipe was held in New York City last week, and although the price of Pig Iron has been advancing steadily for some time, the manufacturers decided that no change should be made in the price of their product to the jobbing trade at this time. It seems that considerable work is still unplaced by the contractors and builders. The reason they are holding up this business is that they do not care to start new work without knowing the decision of the workingmen regarding wages and the number of hours' work per week they were willing to adopt for the coming season. Owing to this state of affairs, the manufacturers of Cast Iron Soil Pipe thought it would be unwise to advance their product, as it might tend to discourage the builders and contractors.

Brass Goods.—The manufacturers of Brass Goods have adopted the recommendations made at their last meeting, which was held in New York City, and have put the 10 per cent. advance then recommended into effect. The price on Flange and Thimble Work has been considerably advanced, but there are so many concerns outside of the association who are manufacturing these lines that it is generally believed to be impossible for the association members to maintain the prices which they are seeking.

S. M. Howes & Co., Boston, Mass., announce in a circular to the trade that for a limited period they are quoting as follows on their Boston Furnace Fittings, Stove Pipe, Elbows, &c.:

	Discount.
Boston Stove Pipe and Elbows	50 %
Yankee Dampers	50 and 10 %
Boston Furnace Fittings	30 %
Reed's Pokers	30 %
Globe Ventilators	60 and 10 %
Rotary Ventilators, 6 to 12 inches	50 %
Rotary Ventilators, 12 to 30 inches	30 %

Screen Doors.—The manufacturers of Screen Doors report a large demand for the current season. This fact, together with the increased cost of lumber, gives the market a strong tone, and some of the manufacturers at least have recently been announcing higher prices.

Solder.—The advance in Pig Tin has been followed by higher prices for Solder. Jobbers are now asking 19 to 19½ cents per pound for Half and Half, guaranteed, in small lots, and 16½ to 18 cents for No. 1 Solder.

Elbow and Skylight Patterns.—Gray's Perfect Elbow and Skylight Patterns, issued by G. L. Gray, 840 North Cedar street, Galesburg, Ill., are meeting with favor, but in order to increase their popularity and sale the publisher has decided to adopt a lower range of prices. The advertisement on another page of this issue gives full particulars.

Wire Nails.—The current demand for Wire Nails is large. Owing to receipts of recent shipments from mills the stocks in the New York market are better assorted. The tone of the market is firm. Small lots of Wire Nails from store are quoted at $2.30 per keg.

Cut Nails.—The Cut Nail Association, which held their meeting last week, made no change in the base price for May, but reaffirmed that existing. A new list of extras was adopted at the meeting by which advances were made on some of the smaller sizes, also on the entire line of special Nails, including Roofing and Slating Nails. The revised card on the last named goods is as follows:

Roofing Nails.

	Extra.
1½-inch	$0.30
1⅜ "	.40
1¼ "	.50
1⅛ "	.60
1 "	.70
⅞ "	.85
¾ "	1.00

Slating.

6d	.30
4d and 5d	.40
3d	.60
2d	.80

The demand for Cut Nails in the New York market is firm. All the jobbers are not yet asking the advance in extras on the new card. Small lots of Cut Nails from store are quoted at $2.30 per keg.

Window Glass.—The advance made by the National Window Glass Jobbers' Association, of which announcement was made in our columns last week, resulted in raising the price on the first three brackets of single strength to the same price as other sizes had been quoted. The advance places all Single and Double Strength Glass from store under the uniform discount of 89 per cent. The demand is not very active, but is showing some improvement.

White Lead.—The consumptive demand for White Lead in Oil is reported to be larger than for the corresponding season of last year. Quotations remain on the level of a week ago, White Lead in Oil in retail quantities ruling at 6½ to 6¾ cents per pound.

Linseed Oil.—Manufacturers of Linseed Oil are employed on light contract orders and are not securing new business to any extent. The demand is confined to small lots for present requirements. Quotations continue without change at 67 to 67½ cents per gallon for small lots.

Spirits Turpentine.—The local market is dull and rather weak, in sympathy with lower values in the South. The demand is quite light, small lots of Turpentine being quoted at 46 to 46½ cents per gallon.

Danger in the Bathtub ?

The London *Lancet*, which for many years has been consistently endeavoring to shield humanity from the various ills which threaten it, has recently turned its attention to the bathtub, and comes out with a strong warning against the danger lurking therein. "Too much bathing," says this medical authority, "tends to maceration of the superficial part of the epidermis, which is too frequently removed, and occasions probably too rapid a proliferation of the cells of the Malpighian layer." This warning should come with great force upon the average American or Englishman, who regards his bathtub as one of the great luxuries and even necessities of life, especially in warm weather. It is calculated to make him pause and consider the serious result involved in a "maceration of the superficial part of the epidermis," and also the peril which lies in "the proliferation of the cells of the Malpighian layer." Doubtless this advice will be welcomed by some who, even in the civilized countries referred to, are not slow in availing themselves of an excuse for abstaining from too many ablutions. It is doubtful, however, whether it will produce much effect upon the confirmed and persistent bather here or abroad. At any rate it is not calculated to advance the interests of some of the trades in which our readers are vitally interested. Consequently *The Metal Worker* refrains from indorsing the recommendation of its distinguished London contemporary.

Dover Stamping & Mfg. Company.
